INDEX OF CONTENTS.

JULY TO DECEMBER, 1886.

A

ABELIA triflora, 82
Abies and **Picea**, the names, 632, 638; **A. concolor**, 724; **A. Douglasii** glauca, 106; **A. Lowiana**, 307, 737; **A. Pindrow**, 52; **A. Pnusoap**, 8
Abroma augusta, 370
Abutilons as climbers, 627
Acacia fistula, 722
Acacia argentea, 82
Achillea Millefolium, rose var., 82; **A. rupestris**, 625
Acora galls, 104, 168
Adelaide, 301
Adiantum Capillus-venereis, 27; **A. cuneatum** elegans, 431; **A. Farleyense**, 692, 754, 756, 800, 816; if spore bearing, 726; **A. gracilimum**, 10; **A. pellucidum**, 19; seedling **E. H. Walton**, 627
Afonis pyrenica, 184
African Rohania, 303
African opium in China, 338
Aganisia tricolor, 75
Agaricus campestris, 492; **A. personatus**, dangerous, 307, 374
Agave americana, flowering, 243; **A. filifera** at Edinburgh, 300; flowering of, 80
Agricultural education, 466; lectures, 403; returns of Great Britain for 1886, returns, the, for 1886, 683
Agri-Horticultural Society of India, (grafting Mangos), 114; of Madras, 304
Aji-Aji, the Pepper of Peppers (Capsicum), 532
Alcohol from the Prickly Pear, 594, 784
Aldershot, Royal visit to, 51
Algerian plants, book on, 474
Algiers, Phylloxera in, 112
Allotment land, 404
Allotments, number and area in Great Britain, 729
Aluvial Manure Co., 622
Almanac, the, 812
Alcocas Lindeni, 242
Aloes 754
Alpine garden, the, 299, 438, 520, 580, 748
Alpine plants, in season, 210; how to sow seeds of, 748; list for, 520; where to find, 725; burnt earth for, 500
Alps, Fens of the, 435
Amantilla the, 202, 755; autumn flowering, 471
Amansonia punicea, 502
American bulb dealers, 279, 339
American Apples, 791
American Apple crop, the, 366
American Exhibition, the, 721
American Peaches, 271, 361
Amittas, the (Cassia Fistula), 147
Amorphophallus titanum, 432
Anemone cuttings of, 270
Andromeda cuneifolia, 109
Anemone fulgens, what cultivation does, 275
Anemones, 121; from seed, 564; in July, 82
Anzencum canadatum, 558; **A. Scottianum**, 331; **A. sesquipedale**, 75
Annals, 215; as decorative flowers, 183; beautiful, 534
Ansellia conchiformis, 779
Antigonon album, 710
Antigonon A. Scherzerianum, var. luteum, 338; **A. Mooreanum**, 497
Antiquities, protective resemblances amongst, 307
Aprary, the, 42, 117, 186, 238, 268, 302, 424, 427, 531, 575, 718, 778
Apocynum andromedifolium, 153
Apple, a large Emperor Alexander, 440; Beauty of Bath, 326; Bismarck, 434; crop, the, American, 366; Leyden Pipin, 222; Nancy Jackson, 533; Rambour Mortier, 119; heavy, 534; Nova Scotia, 395, 818; stocks for, 625
Apples and Pears, diseases of, in the North, 536; English and American, 719
Apricot Kaisha, 759
Aquilegia Skinneri, 146
Aralia Chabrieni = Elaeodendron, 690; **A. Maximowiczii**, 339
Araucaria imbricata, post-mortem on an, 620
Araucarias at the Cape, 186; coning, 52

Arboretum, the Arnold, 204
Arddarcho, 615
Ardisia, an extraordinary, 626; **A. japonica**, 232, 278
Arenaria norvegica in Scotland, 536
Ari-cema laminatum, 178
Aristolochia trilobata, 146
Arnold Arboretum, the, 204
Arvacca, 610
Arran, Australian and New Zealand trees in, 679, 712; miscellaneous plants that have bloomed in, 714
Arrangements at flower shows, 403
Artichokes, Jerusalem, 584
Artemisia, flowering of, 150; **A. Khasiana**, 484
Aster and Stock seed saving at Forest Hill, 438; seed growing at Forest Hill, 470
Aster ebulens, 82; **A. Comet**, 800; **A. gymnoccephalus**, 270; **A. panicoides**, 270
Asters, supplementary list of perennial, 659
Askes, hybrid, 370
Ashton Court, notes from, 494
Asplenium germanicum, 479
Astrantia carniolica, 82; **A. maxima**, 52
Auricula show for the North, 790
Aurucias, 120
Australia, Eschlypti of, 212; indigenous vegetation of, 212
Australian and New Zealand trees in Arran, 679, 712, 714
Australian beauty spot, an, 362
Australian seeds, botanical names of some, 251
Austrian school of horticulture, 624
Austro-Hungary, vegetable products of, 146
Autumn-flowering **Amaryllis**, 471
Autumn leaves for bouquets, 562; tints, 463
Awards made at the Liverpool Show, 50
Ayrton, the late Mr., 722
Azalea, Deutsche Perle, 439; **A. occidentalis**, 494

B

B.E.K.T.A. astariensis, 83
Baker, Mr. E., 208
Balkans from Messrs. Carter & Co., 115
Banana culture in Costa Rica, 50
Bananas, hardy in Surrey, 369; in Tennessee, 408
Bandia Woodwood, 245
Barbados, origin of name, 145
Barkeria elegans, 364
Barley experiments, 498
Barometer, English v. French, 412
Baronhill, 237
Bathmia tomentosa var. glabra, 814
Bayfortbyrill, Cedars at, 427, 520, 552
Beans, French, 814; Tonquin, 456
Beany spot, an Australian, 362
Bedding stuff, to increase by cuttings, 142
Bedlont, Feltham, seed-grounds at, 264
Bees, 214; and colour, 439, 471, 534, 467; and Snapdragon flowers, 505; law of, 238, 267; wax, 618
Begonia, a line, 53; **B. Hoegema**, 200; **B. lucida** var. rosea, 370; monstrous, a, 178; **B. Princess Beatrice**, 371; **B. socotrina** flowering from the bulb, 622
Begonia, at Messrs. Sutton's, 203; double tuberosity-rooted, 535; tuberous-rooted, 266, 307; at Messrs. Laing's, Forest Hill, 535
Belgian Horticultural Societies, Federation of, 213
Belgian horticulturists, excursion of, 13
Bellede, 692
Berberidopsis coralina, 816
Berberis asiatica as a hedge plant, 301; Japanese, 306
Berlin Gardens, the, 688
Berries, **Berberis** aquifolia, if poisonous, 345
Bigarreu Cherry **Leon Quessel**, 305
Birchfield, Fallowfield, 44
Birmingham Gardeners Mutual Improvement Society, 49
Birtwell, Thomas, 338

Black Country flower shows, 114
Black spot on leaves of Camellia and Orange, 530
Black Walnut, the, 616
Bleia verucunda, 140, 424
Bog garden in the Royal Botanic Garden, Edinburgh, 174
Boiler contest at Liverpool, the, 18, 48, 118, 122, 245
Boiler, Trendham greenhouse, 148
Boiler, Weeks' fireplace, 788
Boilers, 372

BOOKS NOTICED

Advertisers A. B. C., the, 539
Algerian Plants, see p. 474
Church Decoration, see p. 470
Colour, see p. 118,
See Manual (Victor Rendu), 112
Bees and Bee-keeping (Cheshire), 141
British Orchids (Webster), 814
"Building News," 814

Botanical Rambles in South China, 586, 618, 650
Botanical department, Jamaica, 752
Botanists, honours to Californian, 785
Botany and horticulture in India, 147
Botany, at Liverpool University, new commercial class of, 434; in Medical Education 402; cultural, 361
Bouquets, Christmas, 807
Bouvardia Humboldtii corymbiflora, 501; planting out in summer, 501
Bouvardias, 364; turned out, 508
Boxwood, Bandha, 246; Cauticus, 434
Bradford Gardeners' Mutual Improvement Society, 471; School of Science and Art, 562, 564
Brassavola Digbyana, 143
Brick Tea, 50
Carnations and Picotees, 333
British Columbian trees, 120; fungi, 496; plants, white forms of, 244; wines, 562
Broccoli, 524
Brodiaea Douglasii, 625
Broxbourne, 714; rock plants at, 234
Buddleia curviflora, 179; **B. globosa** in fruit, 366
Buff berries, import of, 114
Bull dealers, amateur, 279, 350; garden, the, 303, 495, 563, 744, 810
Bulls, Cape, 601; treatment of, 60
Bulls, cumulative benefit ground, 439; how they descend into the soil, 625; profuse Narcissus, 372; and tubers planting, 495
Biuphane toxicaria, 47
Bupleurum fruticosum, 82
Burnt earth for alpine, 500
Burnthorn, the, 622, 784, 594

C

CABBAGE, a good, 502
Cactus spiffi, 504, 784
Caladiums, 115
Calandrinia umbellata, 260, 439
Calanthe versicolor, 470
Calceolaria Hurbidgei, 151; **C. Sinclairi**, 52
Calceolarias, 203
Calliphyse mirabilis, 181
Calliphya grandiflora, 427
Cambridge Botanic Gardens, 83, 395
Camel's Father, plants, 727
Camellia, the, 639; **C. sanguinea**, 790
Camellias, striking cuttings of, 123
Campanula Allioni, 12; **C. macrostylis**, 230; **C. persicifolia**, 528; **C. Raineri**, 150
Canadian fruit at Edinburgh, 531; at South Kensington, 539
Canada, produce from, 434
Cannell & Sons, Chrysanthemum at, 695
Cape Boxwood, 715; bulbs, 561; treatment of, 500; woods, 756
CAPERS, 557, 593
Carpenter's pinna, 557
Capsicum, Aji-Aji, 532
Carnation Lady Anne, 245; **C. Souvenir de la Malmaison** at Rangoon, 334
Carnations and Picotees, 13, 120; at Slough, list of, 149; winter-flowering, 494; yellow ground, 121
Carnations at Messrs. Veitch's, 111; diseases of, 244; dwarf tree, 424; tree, 520
Carnivorous Nephentes, 592
Carpenteria californica, 115, 149, 174, 339; flowering of, 306
Carriage-building trade, 531
Carse of Gowrie, sale of orchard fruit at, 309
Carter's Provident Sick Fund, 657; Tobacco experiments, 339; Wheats, hybrid, 240
Cassia Fistula (Amittas), 147; **C. liginea** and the Chinaman, 82
Catalpa Bongertholii, 785; **C. longilobum**, 654
Caterpillar, eating skin of ripe Grapes, 220; on Tobacco, 569
Cattleya bicolor Wrigleyana, 393
Cattleya, "blue," a new, 811
Cattleya, calumata v. 524; **C. crocata**, 431; **C. Dowiana** var. aurea, 360; **C. Eldorado**, 155; **C. Gaskelliana**, 75; **C.**

6245; 701; *C. labiata* var. *Mossie*, 75; *C. laevigata*, 82; *C. Ludlowi*, 82; *Dale's var.*, 341; *C. Ludlowi* candida, 331; *C. Measurie*, 520; *C. Mossie*, 506; a fine specimen of, 409; three-and-half, 3, 11
Cathartes, mentioned at, July, 83; and *larvae*, putting of, 93
Ceanothus Glorie de Versailles, 217
Cedar at *Briely Park*, 409
Cedars at *Bayliffbury*, 427, 520, 552; of *Lebanon ripens*, 427
Celastrus at *South Africa*, 556
Celery disease, *Puccinia bulbata*, 76; *history of*, 26; *leaves disfigured*, 41; *White Flume*, 310
Centaurea glaberrima, 82; *C. macrocephala*, 82, 108, 455
Centradia and *Ehrenhreit*, 338
Cerastium Watereri, 710
Cerise minor, 212
Ceylon, 153, 301; *Cinchona* cultivation in, 154
Cheal's Nursery, 321
Chemical constituents in a ton of various kinds of fruits, 130
Cherry-cod, 622
Chicoume, 75
China, plant exchange in, 146; *South*, botanical rarities in, 586, 650
Chinese, economic plants, notes on, 49; *plants*, 212; *Primrose*, double, 52
Cincinnati, a trip to, 130, 209
Chiswick, *Scientific and Literary Society*, 114; *Young Gardeners' Mutual Improvement Society*, 456
Chiosia terrata, 154
Christmas bouquets, 807; *decorations*, 100
Chiswick for 1886
Chrysanthemum, *G. Wernig*, 450; *C. Leucanthemum*, 82; *C. maximum*, 274; *C. Mrs. Norman Davis*, 720; *C. oliginum*, 309; *season*, the, 588; *Society*, the *National*, 49, 242
Chrysanthemums, 203, 502; at *Beechwood*, 624; at *Birmingham*, 815; at *Finsbury Park*, 580; at *Harleiden Park*, 574; at *Heckfield*, 405; at the *Inner Temple*, 588; at *Mr. Cannell's*, 683; at *Messrs. J. Veitch & Sons*, 622; at *Trueloves*, 758; at *Workshop Manor*, *Notts*, 604; *winter*, 814. (See *Societies*.)
Cinchonum virginianum, 405, 680
Church decoration, book on, 470
Chusquea abietifolia, 524
Chysis aurea, *secreting glands* of, 209
Cinchona, *birks* in *Colombia*, 503; *insect* pests of, 532; *manuring*, 594; *trees*, *quinine* in, 504
Cinerarias, 203
Cirriophallum pulchrum, 458
Cistus family, the, 114
Cistus in *Portugal*, species of, 114
Citron, *culture* in *Corsica*, 3; *how prepared*, 154
Cladopsis, 116
Clematis, *fruit*, *flowering*, 408; *C. vitalba*, 405
Cleome *Andromeda*, 604; *C. trichotoma*, 330
Clover, *Japan*, 409; *Calvary*, 316
Coal, *anthracite*, 508
Cologne *cristata maxima*, 350; *C. Dayana*, 41; *C. paniculata*, 74
Colic, *insect* pests of, 532
Colocasia *Devansiana*, 115
Colonial and Indian Exhibition, 3, 18, 72, 116, 153, 202, 295, 324, 530

Gardier. SALE OF FLORIST'S and MARKET GARDENER'S BUSINESS.

MR. W. COURTENAY CLARKE is instructed to OFFER for SALE by TENDER, as a going concern, subject to conditions, the BUSINESS of Mr. William Thompson, 6, Crookhatchdown, Cardiff, and Whitchurch, Seedman, Florist, and Market Gardener. The shop is situated in the best part of the important town of Cardiff, and possesses every accommodation for the carrying on of a extensive business. In the rear are large and well-constructed Hothouses, fitted with every appliance and stocked with a choice selection of Plants. A Lease of the Premises may be obtained for 21 years, at a rent of £100 per annum. The Garden and Ground at Whitchurch (near Cardiff) have been under careful cultivation for a long period, and are well supplied with Fruit, Shrubs, Flowers, and Ornamental Trees. The rent of the Gardens at Whitchurch is £48 per annum. The Sale presents a special opportunity to any Florist and Gardener desirous of obtaining an established business, favourable terms. Separate Tenders must be delivered to the Broker for the business, which is offered in the following Lots—Lot 1.—Goodwill, Greenhouse, Shop, Fixtures, Trade Bills, Hothouses, and Stock, at £200. 6, Crookhatchdown. Lot 2.—Book Debts, amounting, as per Schedule, to £246 14s 2d. Lot 3.—Stock of Fruit, Plants, and Shrubs, at Whitchurch. The Broker, on behalf of the vendors, reserves to himself the right of accepting the highest aggregate Tender for Lots 1 and 2, and would point out that by acquiring the Book Debts the purchaser of the business will in a large measure secure the valuable connection already formed. Schedules of the Stock, Plant, Trade Utensils, and Book Debts may be seen at the Office of the Broker, to whom all Tenders must be delivered on or before July 13, 1886.

For further particulars application may be made to F. C. GOODCHILD, Esq., 25, Old Jewry, London, or to the Broker, at his Office.

THE LIVERPOOL HORTICULTURAL COMPANY (John Cowan), Limited.

Have a large and fine stock of EAST INDIAN, ALEXANDRIANA, and other ORCHIDS; and they are constantly receiving fresh importations from various parts of the world. W.M. CUTBUSH AND SON (Limited), Nurserymen and Seed Merchants, Highgate Nurseries, N.

The "Covent Garden Gazette" says:—"That to most of our readers the name of H. CANNELL AND SONS is probably as well known as their own. THE 'HOME OF FLOWERS,' at SWANLEY has long been noted for the excellence of its productions and the variety and novelty of its introductions in horticulture. When it is understood that the enormous business carried on at Swanley is largely supported by professional florists it will be seen that Messrs. Cannell can fairly claim to take foremost rank in matters floral. Although their productions are rarely shown at exhibitions, whenever they do so they generally gain the highest honours. They really have no need to exhibit. Their display is on view all the year round, and, thanks to a standing invite to all, one will at any time, with the exception of Sundays, meet with a ready welcome from the general proprietors. In order to appreciate the advance that it means made in horticulture, a visit should be paid to the 'Home of Flowers.'"

CHUBB, ROUND & CO., WEST FERRY ROAD, MILLWALL, LONDON, E.

J. JENSEN & CO.'S NORWEGIAN FISH - POTASH MANURE.

Fish Manure is composed of flesh and bone—the best of all fertilising materials, and in combination with pure Salts of Potash and Magnesia forms a perfect fertiliser, as it contains the important ingredients of Ammonia, Phosphates and Potash in their most concentrated and available form. It is equally valuable for Farm Use, for Fruits, Flowers, and Vegetables, and produces wonderful growth, especially with Vines.

The Average Manurial Constituents are as follows:—
Cod Fish and Potash. Herring and Potash.

Per Cent.	Per Cent.
7.0 Ammonia 8.30	
20.0 Phosphates 9.20	
15.0 Potash 15.10	
10.0 Magnesia 10.00	

Or, in other words, a ton of COD FISH and POTASH is composed, approximately, of—

- 10 Cwt. of Dried Fish Flesh—Organic Matter.
- 4 Cwt. of Dried Fish Bone—Phosphates.
- 3 " of Sulphate of Potash.
- 1 " of Sulphate of Magnesia.
- 1 " of Moisture, and ingredients not of manurial value.

The Prices are £10 per Ton (bags included) for the COD, and £9 for the HERRING, on Rails in the Docks, subject to Discount for prompt Cash.

Retail Prices, Carriage Paid, upon receipt of P.O.O. IN TINS.—2 lb. for 1s.; and IN BAGS, 7 lb., 2s.; 14 lb., 4s.; 28 lb., 6s. 6d.; 56 lb., 10s. 6d. 112 lb., 20s. 7 1/2 cwt., 35s. Bags free.

Extracts from South Annual Collection of Reports—Native Guano for Potatoes.—H. S. EASTY, Great Totham, Essex.—"Used for Potatoes. Good. Consider this manure about the best for Potatoes. Very economical. Took about twenty prizes." Native Guano for Vegetables and Fruit Trees.—J. SMITH, Head Gardener to the Right Hon. Lord Rosbery—"Used for Peas, Onions, Lettuce, Cabbages, Potatoes, Turnips, and Fruit Trees. Onions a splendid crop. Other crops most satisfactory." Native Guano for Vines, Roses, Strawberries, Pot Plants, &c.—J. TOWNSEND, Forest, Putney—"Used for Currants, Roses, Cucumbers, Tomatoes, Chrysanthemums, Pelargoniums, Fuchsias, &c. Excellent results. Best and safest manure I have tried." D. WILLIAMS, Gardener to Lord Wiltshire—"Used for Vines, Strawberries in pots, Peaches, Asparagus, Onions, &c. Very good on all kinds tried." A. F. HARRON, Royal Horticultural Society, Chesham—"Without doubt a very valuable manure, and easy of application."—Orders to THE NATIVE GUANO CO. (Limited), 20, New Bridge Street, Blackfriars, London, E.C., where Pamphlets of Testimonials may be obtained.

Rosher's Garden Edging Tiles.

THE ABOVE and many other PATTERNS are made in materials of great durability. The plainest sorts are especially suited for KITCHEN GARDENS, as they harbour no Slugs or Insects, take up little room, and, once put down, incur no further labour or expense, as do "Grown" Edgings, consequently being much cheaper. Form an Artificial Stone, very durable and of superior finish, and in great variety of design.
F. ROSHER and CO., Manufacturers, Upper Ground Street, Blackfriars, S.E.; King's Road, Chelsea, S.W.; Kingsland Road, E.

R. HALLIDAY & CO.,
HOTHOUSE BUILDERS AND HOT-WATER ENGINEERS,
ROYAL HORTICULTURAL WORKS, MIDDLETON, MANCHESTER.

Vineries, Stoves, Greenhouses, Peach Houses, Forcing Houses, &c., constructed on our improved plan, are the perfection of growing houses, and for practical utility, economy, and durability cannot be equalled. We only do one class of work, and that THE VERY BEST.

Conservatories and Winter Gardens designed architecturally correct without the assistance of any one out of our firm, from the smallest to the largest. Hot-water Heating Apparatus, with really reliable Boilers, erected, and success guaranteed in all cases. Melon Frames, Sashes, Hobbed Boxes, &c., always in stock.

Plans, Estimates and Catalogues free. Customers waited on in any part of the Kingdom.

Our Maxim is and always has been—

MODERATE CHARGES. FIRST-CLASS WORK. THE BEST MATERIALS.

Greenhouses of every kind Designed, Erected, and Heated.

Constructed so as to obtain, with the least obstruction to light and sun, the greatest strength and rigidity, at prices which, owing to unusual facilities, defy competition.

Gentlemen will do well to obtain an Estimate from us, for which no charge is made, before placing their orders elsewhere.

A GOLD MEDAL (the highest award) has this year been awarded to us in open competition for general excellence in Horticultural Buildings, by the Society of Architects.

TO ORCHID GROWERS, &c.

MR. CHAS. PATIN,
OF ANTIOQUIA, U.S. COLOMBIA,

Who has been resident there for the last 13 years, and is now on a visit to Europe, is now Booking Orders for COLOMBIAN ORCHIDS for next spring delivery. About 80 species can be supplied. Price LIST and full particulars will be furnished upon application to

MR. CHAS. PATIN, Basecles, Hainaut, Belgium,
up to August 25, after which date please address all Communications to
ANTIOQUIA, U.S. COLOMBIA.

LINDLEY'S MEDICAL AND ECONOMICAL BOTANY. With numerous Illustrations. 8vo, cloth, price 5s.
LINDLEY'S DESCRIPTIVE BOTANY. For Self-Instruction and the Use of Schools. Price 1s. sewed.
London: **BRADBURY, AGNEW, & CO.,** Bouverie Street, E.C.

IMPORTANT TO GARDENERS.

FRANCIS & CO.

SUPPLY:—

- 1.—Garden Sprinkles of all kinds.
- 2.—Indiarubber Delivery and Suction Hose.
- 3.—Galvanised Wire Netting.
- 4.—Indiarubber Door and Carriage Mats.
- 5.—Jutta-percha Goods.
- 6.—Superior Waterproof Garments.
- 7.—Barometers, Thermometers, and Rain Gauges.
- 8.—Prepared Chloride of Ammonia for destroying Insects.
- 9.—Telegraph Instruments.
- 10.—Insulated and Galvanised Iron Wires.
- 11.—Medical and other Electricity.
- 12.—Lightning Conductors.
- 13.—Electric House Bell.
- 14.—Fire and Burglar Alarms.
- 15.—Speaking Tubes.
- 16.—Adjustable Electric Thermometers.
- 17.—Disinfecting Fluids, &c.
- 18.—Francis & Co.'s Insect Destroyer.
- 19.—Garden Tools of every description.
- 20.—Quotations for every requisite.

THE TRADE SUPPLIER

ADJUSTABLE ELECTRIC THERMOMETERS For GREENHOUSES, VINERIES, CONSERVATORIES, FORCING PITS, INCUBATORS, and for FIRE.

TESTIMONIALS.

"Your Thermometers are now in all the Sheds, and to you are we indebted for uniformly strong and healthy Plants."
 "It might your Electric Tell-tale saved what is probably the finest house of Vines in the Kingdom."
 "Your Electric Thermometer is a mighty good thing, and no Wine Grower should be without them. Timely notice of approaching frost means the saving of perhaps a whole crop."

THE ADJUSTABLE ELECTRIC THERMOMETER

Is so applied, that when the temperature either rises above or falls below the degree at which it may be set, a bell is sounded or other signal given at however great a distance. Any number of Thermometers may be employed with the same Bell, so that every point can be under thorough protection at COMPARATIVELY TRIFLING EXPENSE.

FRANCIS AND CO.'S Thermometers are largely employed by Wine Growers in the open as well as under Glass, and are most valuable for Conservatories, Greenhouses, Forcing Pits, Hospital Wards, and in the process of Incubation.

Used throughout the Ostrich Farms of South Africa.

ADJUSTABLE ELECTRIC THERMOMETERS

Also form the most perfect PROTECTION AGAINST FIRE, the ever ready Alarm signalling the very first outbreak instantly.

Readily applied. Fitted with ease and certainty.

PRICES.

Large Bell Wire, Push, and Battery, complete for any communication	£ 2 6	d. 0
Ordinary Thermometers, from—each	1 5	0
Registering " " " " " " " " " " " "	0 1	0
Insulated Wire, Galvanised Wire and Insulators desired.	0 1	6

Bells, Batteries, Thermometers, &c., separate if required.

ALSO

ELECTRIC FIRE ALARMS, and ELECTRIC HOUSE BELLS,

As supplied to the Government Offices and Railway Companies.

ALL GOODS GUARANTEED.

The £3 set delivered, carriage paid, at nearest Railway Station.

ORCHID EXHIBITION.

One of the most beautiful sights in London.

ORCHIDS.—MR. WILLIAM BULL'S ORCHID EXHIBITION. The Private View to Patrons of the Establishment is held every TUESDAY, THURSDAY, and SATURDAY, 10 to 5 o'Clock, throughout JULY. Establishment for New and Rare Plants, 536, King's Road, Chelsea, London, S.W.

ORCHIDS.—MR. WILLIAM BULL'S EXHIBITION IS OPEN to the Public every MONDAY, WEDNESDAY, and FRIDAY, 10 to 5 o'Clock, throughout JULY. Admission, each day, 2s. 6d.

ORCHIDS.—A vision of loveliness unparalleled in Europe.

ORCHIDS.—"Must be seen to be realised."

ORCHIDS.—"A scene of the greatest Orchidic beauty, biding description, and we had almost said, defying exaggeration."—Gardener's Chronicle.

ORCHIDS.—Specimens in Flower from Brazil, Colombia, Mexico, Ecuador, Madagascar, Assam, Peru, Costa Rica, Venezuela, West Indies, Borneo, Boreo, and various other parts of the Eastern Archipelago.

ORCHIDS.—Private View to Patrons of the Establishment every Tue-day, Thursday, and Saturday, 10 to 5 o'Clock, throughout JULY.

ORCHIDS.—Public Exhibition every Monday, Wednesday, and Friday, 10 to 5 o'Clock, throughout JULY. Admission, each day, 2s. 6d.

ORCHIDS.—The Exhibition is worth going any distance to see at Mr. WILLIAM BULL'S Establishment for New and Rare Plants, 536, King's Road, Chelsea, London, S.W.

Now Ready,

REICHENBACHIA:

ORCHIDS ILLUSTRATED AND DESCRIBED.

By F. SANDER, St. Alban's.

This Work is issued in Monthly Parts, each containing four beautiful Coloured Plates by eminent Floral Artists.

The History and Culture of each Plant is given in English, French, and German. The Latin Descriptions and Leaders, &c., by Professor Reichenbach.

Price of each Number to Subscribers, 7s. 6d. per Month.

Size of Plates, 21 inches by 15 inches.

Sample Copies post-free on application, to be returned in case of non-subscription to

F. SANDER, ST. ALBAN'S.

THE

Gardeners' Chronicle.

SATURDAY, JULY 3, 1886.

EATON HALL.

THIS, the principal seat of the Duke of Westminster, is four miles from Chester. Horticulturists from the south, the eastern, or western parts of England, who attend the Liverpool Show, could easily visit Eaton by breaking their journey at Chester, and in so doing would have an opportunity of seeing, not only one of the best appointed and well kept gardens in the kingdom, but also the finest private residence of modern date in Europe. Our illustration (see supplementary sheet) gives an idea of the magnificent character of the building, but the full extent is not shown, the photograph from which it was taken not including the whole. It is of polished stone, and as substantial in its construction as it is imposing in its appearance.

The surroundings are in keeping with the mansion, the pleasure-grounds are extensive, and kept in excellent order.

The extent of glass erections devoted to the cultivation of plants, flowers, and fruit, is on a scale similar to the rest of the establishment. Most of the houses are of comparatively recent construction; they combine the essentials of being well adapted for the cultivation of the different things grown in them, and of enduring for a long time, stone or some other imperishable material being used wherever it could be introduced. The principal block of plant-houses is connected with a corridor, 400 feet long and 18 feet high. This long vista, with the back wall densely covered with plants, and the roof gracefully festooned with climbers, combined with the lines of flowering subjects temporarily brought in to keep it gay, presents a floral picture unique in its way. Callas, scarlet Pelargoniums and Schizanthus, large and profusely flowered, were the principal occupants a few weeks back, and produced an effect not to be easily forgotten. Each of the large houses attached to, and standing at right angles with this glass-covered way, has some particular kind of plant or plants that forms the leading feature in it. In one of these houses are Roses covering the entire roof, with others loosely encircling the pillars; Camellias occupying the body of the house. Another was filled with specimen Azaleas, finely in flower.

Two others are mostly occupied by Eucharis amazonica, in the cultivation of which Mr. Selwood has been so successful, and latterly so unfortunate, for the dreaded mite has nearly destroyed the whole stock; but a fresh start has been made, and a house is full of new plants which look promising. One of these houses is filled with a mixed collection of stove plants. Another is the Lily-house, with its roomy central tank always containing a number of plants alike beautiful and interesting. One of these spans is filled with Dracenas, and other plants of like character, and the roof covered with Stephanotis laden with flowers. In the Camellia-house the plants are planted out in a centre bed, on one side of which there is a row of seedling *Luculia gratissima* not two years

old, yet most of them are 5 feet high. They are well furnished, and all flowered last autumn; some of them showed a trace of *L. Piceana* in their flowers.

Toxicophlea Thunbergii is a favourite here; a considerable space of back wall in one of the houses of a long lean-to range being devoted to it. *Dipladenia boliviensis* is also grown largely. The double form of *Tabernaemontana* is another white flower grown in quantity; some of the plants are 7 feet high. Of another house *Gardenias* are the principal occupants, with quantities of *Clerodendron Balfourii*.

Orchids occupy two of the four houses in which Pines, now done away with, used to be grown. These houses are very light, and with the plants as they are, well up to the glass, there is little doubt of their growing well. Another house is devoted to *Cattleyas*, *Laelias*, and others requiring an intermediate temperature. *Odontoglossums*, and other cool kinds, having a house to themselves.

Fruit, as might be supposed, is grown in large quantities, and on the whole is well done. Vines occupy ten or twelve houses; the first grapes this season were out on April 8. In the second viney Black Hamburgs were nearly ripe the second week in May; Madresfield Court were about three weeks later. Other houses to follow with Muscats, and the late crops for winter, were of very promising appearance. Five houses are filled with Peaches; the earliest being forced to come in at the beginning of May, others to keep up a succession. The trees are in good condition, and are carrying good crops. Figs occupy a considerable space—fine trees, bearing abundantly. A large tree of Negro Largo that has been often moved was carrying a grand crop of wonderfully fine fruit. One of the most remarkable of the houses of indoor fruits is a large house of Plums; the trees are big, and in beautiful condition, occupying the back wall, and a trellis along the front. The principal sorts are Green Gage, Transparent Gage, and Coe's Golden Drop, thickly and evenly set, so that thousands will have to be thinned out. Strawberries in vast quantities are forced—Keens' Seedling and Sir Harry are the only sorts grown. An unusually fine crop of Melons occupied one of the houses; some were ripe, with great numbers coming on.

The various houses devoted to fruit are situated in what used to be the kitchen garden, but which is now principally occupied by hardy fruits, which are very well grown. In addition to the walls, on which are the usual kinds of trees, Pears and Apples, in the shape of bushes and pyramids, are present in quantity, and in very good condition. Mr. Selwood has in this garden a number of very useful movable span-shaped frames, about 2½ feet high, and as wide at the bottom as will admit of their being placed over rows of early Peas, Potatoes, French Beans, or Christmas Roses (which latter are grown in large quantities), and for covering which they are used at the end of the year, coming in for the other things named in succession, as also for Strawberries to fill up the time between the latest forced and the first from the open ground. At the middle of May a quarter of this fruit was nice and snug beneath them. They are open at the ends, so that they butt together in continuous lines, and in this way admit sufficient air to whatever is under them.

CITRON CULTURE IN CORSICA.—The Citron seems to be the most important article of trade in Corsica. It is stated to have much improved of late, after some years of stagnation. The 1885 crop was very large. About one-fourth of the annual produce is usually exported to England in brine, to be there manufactured into candied citron. The remainder formerly went to Leghorn, to be manufactured for Holland and America, but two large preserving factories are now at work at Bastia, and the whole of this important manufacture will probably be carried on in the island in future.

New Garden Plants.

GUNNERA MANICATA.*

A FEW days ago the new curator sent in a specimen of a huge *Gunnera* to the herbarium to ask if it was the true *manicata*, and I was astonished to find that not only had we no specimen of the plant in the herbarium, but that, although it has been before the world twenty years, that it has never been described. Upon reporting the state of the case to Mr. Nicholson he immediately applied to Sir George Macleay, and procured from his gardener, Mr. Ross, a fine specimen in full flower, from which the annexed description and diagnosis has been made, and which is now in process of being dried for our herbarium.

G. manicata was discovered about 1865 in Southern Brazil, by the unfortunate traveller Libon. The locality is described as marshes at the foot of the first ramparts of the Serra do Mar, at a place called Campos de Lages. It does not seem to have been found by any one else, and Professor Kniz, who recently monographed the order Haloragaceæ for the grand *Flora Brasiliensis*, edited by Martius and Eichler, had never seen a specimen, and merely mentions it by name. No other *Gunnera* has been found anywhere on Brazilian territory. It is quite distinct specifically from the Chilean and Bolivian *Gunnera chilensis* of Lamarek, which is almost always known in gardens by its later name, *G. scabra*, of Ruiz and Pavon. This is rather less robust than *manicata*, with fewer narrower scale-leaves at the base of the peduncle, leaves different in shape and texture, thicker, with the basal lobes much shorter and incurved; flower-spikes very much shorter and stiffer, individual flowers much smaller, and, if our live *Keck* plant represent it properly, with much shorter styles and stamens deciduous in an early stage of the flower, instead of remaining till the styles are fully developed. Very likely the flowers are polygamous, and in some of them no stamens are developed.

The following description of *G. manicata* is drawn up entirely from Sir G. Macleay's specimen:—

Rootstock very thick, decumbent. Scale leaves very abundantly produced round the base of the peduncle, equalling it in length, lanceolate, lacinated, at first pale pink and membranous, finally becoming brown and scarious. Proper leaves with a green terete petiole, 3 feet long, 2 inches thick, copiously armed with spreading prickles; blade cordate-orbicular, 4 feet in diameter (Libon says the leaf attains 15 metres in circumference), with a basal sinus 1½–18 inches deep, and two imbricated round basal lobes, paler green than in *scabra*, quite glabrous on both surfaces, not nearly so stiff in texture, and not so scarious, palmately lobed to a depth of half a foot; lobes irregularly toothed; petiole attached at the base of the sinus; primary ribs five, mucated on the underside of the leaf, the two outer forked a short space above the base, the three central ones below the middle, the former running out into three lobes apices, the latter into two lobes apices, so that the total number of lobes is twelve. Peduncle stout, mucated, half a foot long. Panicle narrow ovoid, about 2 feet long and a foot in diameter, formed of innumerable ascending flaccid cylindrical spikes half a foot long, with a green lanceolate bract 1½–2 inches long at the base of each; axis of the spikes ½ inch diameter; flowers laxly disposed, apetalous, hermaphrodite; ovary green, globose, ½ inch in diameter; calyx-teeth two, minute, deltoid-cuspidate, placed alternately with the stamens; styles two, divaricate, cylindrical, as long as the ovary, joined only at the very base, hairy all the way down; stamens two, as long as the styles, with a stout green cylindrical filament as long as the subglobose reddish brown anther; pollen yellow.

* *Gunnera manicata*, Hort. Lin'ens. Belg. Hort., 1869, p. 104 (name only); A. DC. in DC. *Prod.*, vol. xvi., pt. 2, p. 660 (name only); Kuntze, in *Fl. Berol.*, vol. xiii., pt. 2, p. 382 (name only); Boissier, in *Ill. Hort.*, 1884, p. 125, tab. 1034 (coloured figure, showing general habit, without description); Herliaca maxima, caudice brevi, petiolis crassis elongatis, teretibus mucatis, foliis cordato-orbicularibus palmatifidis flaccidis glabris lobis basalibus mucatis mucatis, pedunculis semipedibus crassis mucatis foliis rudimentariis copiosis scariosis rubelle emittis, floribus parvis hermaphroditis in paniculam lopedalem ramis spicatis laxioribus flaccidis bracteis semipedibus dispositis, ovario globoso, dentibus calycinis minute helioido-cuspidatis, petalis abbreviatis, stylis ovario apiculatis, crastibus erectis patentibus, ovata aequilongis filamentis crassa antheris subglobosis æquilongis.

As the description of *G. chilensis* in the *Prodrumus* is evidently drawn up from herbarium specimens I will give a short one made from the living plant, to compare with the above. The date of publication of Lamarek's name, *Gunnera chilensis*, is 1789; of Ruiz and Pavon's name *Gunnera scabra* is 1797; and they evidently mean the same species.

Caudex erect, about a span long; scale leaves fewer and not so brightly coloured as in *manicata*; petiole terete, 3 feet long, 1½ inch thick, copiously mucated; blade cordate-orbicular, 3 feet in diameter, dark green, very rugose, quite glabrous, much firmer in texture than in *manicata*, with a broad open basal sinus, and short rounded basal lobes incurved like those of *Viola cucullata*; peduncle terete, mucated, ½ a foot long, above an inch thick; panicle oblong-cylindrical, 15–18 inches long, 3–4 inches in diameter; spikes erecto-patent, stiff, cylindrical, 1–1½ inch long, ¼ inch in diameter, with a linear bract at the base; flowers densely disposed, reddish-brown, just like those of *manicata* in structure, but much smaller, with the anther either not developed or falling in an early stage.

Our wild specimens of *G. chilensis* in the *Keck* herbarium are as follows:—1. Juan Fernandez, Douglas; 2. Chiloe, Captain Kiog; 3. near the city of Baldivia, Lechler, 222; 4. Lake of Quintero, Valparaiso, Bridges, 216; 5. Andes of Bolivia, at an altitude of 3000–3200 metres, Manden, 898. André states that in Guayresoy the leaves reach a diameter of 2–2½ metres.

Of allied species described in the *Prodrumus*, *G. comutata*, Blume, is known very imperfectly and not localised; *G. insignis*, A. DC., was discovered by Oersted in Costa Rica; *G. bracteata*, Bennett, from Juan Fernandez has usually a little petal developed; and *G. peltata*, Philippi, from Juan Fernandez, has petalate leaves. *G. bracteata* is figured by Hemsley in the *Botany of the Voyage of the "Challenger,"* t. 84. Besides these there have been since published *G. glabra*, Philippi, from Juan Fernandez; *G. brephaga*, André, in *Ill. Hort.*, n. s., t. 111, from New Granada, with petalate leaves; and *G. umbraculifera*, Linden, *Cat.*, 1875. If any of these are alive in English gardens it is desirable that descriptions made from the living plant should be placed on record. *J. G. Baker.*

ABIES PINSAPO.

IN a previous number (October 10, 1855) we gave an illustration of a single cone and a branch of this distinct and handsome Silver Fir. To make the illustration more complete, we now add a sketch showing the arrangement and form of the male catkins (fig. 1). It will be seen that they are placed in the axils of the leaves on all sides of the branch (owing to the way in which the leaves spread on all sides). Each catkin is about half an inch in length, oblong obtuse. The anthers are feat-shaped, rich violet colour, and the connective is prolonged at the back into a short, abrupt point, not shown in the drawing. The pollen grains are provided with two air-sacs. In our previous note we alluded to some peculiarities in the growth of the tree, and, among other things, to the circumstance that the terminal bud of the shoots usually expands first in spring (as in many other Firs). This, however, is not constant, for in some shoots pushing out of season in the autumn of last year some, but not all, of the lateral buds were more advanced than the terminal one.

THE COLONIAL EXHIBITION.

No. V.

CYPRUS.—The exhibits from this recent addition to the British possessions are not numerous, but they are nevertheless of very great interest, particularly from an antiquarian point of view. There are, however, comparatively few vegetable products, and these include sections of the principal timber trees, and collections of fruits and seeds, none of which call for any remark except, perhaps, some of the cones of the *Catob* bean, *St. John's Bread* or *Locust* (*Ceratonia siliqua*), and a sample of a coarse kind of molasses or honey, extracted from them. These dark brown or blackish beans are well known in most towns, and are usually to be seen in small shops in poor neighbourhoods, being sold to children who eat them for the sake of the sugar they contain. About 30,000 tons of these

beans are annually shipped from Cyprus, the average price being about £3 per ton. They are principally used for making the patent cattle foods now so much advertised. At one time Locust pods had a reputation for clearing the voice, and were used for that purpose by singers.

An object of especial attention from Cyprus is the native cart, such as has been in use for over 2000 years, and is still used in the island. Its construction is of the roughest character, the wood being simply hewn with an axe, and the whole put together without the use of a nail.

CANADA.

Next to the Indian collection the Canadian exhibits occupy the greatest space. The agricultural trophies, consisting of cereals in the upper portion, and a splendid collection of fruits such as Apples, Pears, Cherries, Raspberries, preserved in fluid with all their rosy tints, and some very large and very bright red Cranberries in the lower portion, attract, of course, much attention. These fruits are so interesting as to demand special notice, and may therefore

other 18 feet 8 inches; each trunk is about 14 or 15 feet high, they are said to weigh 5 tons each, and are the largest logs in the whole exhibition; they are certainly most noble specimens. A piece of each is cut out in front, and polished to show the grain, which is even, of a beautiful deep red colour, easily worked, and takes a good polish; the wood is very generally used by cabinet-makers in Queensland and New South Wales, as well as in India and Burma, where the tree also grows. The trunks in question were grown on the Blackall Range in the Moreton district. Woods are particularly well shown in the Queensland court; the collection is very complete; they are all carefully selected and are well cut, polished, and labelled, and amongst them are some of more than usual interest, especially amongst the Liliaceae, Palms, and Filices, such, for instance, as *Dracena angustifolia*, *Ptychosperma Normanbyi*, *Licuala Muelleri*, *Dicksonia Youngii*, &c. These, of course, are more of scientific than commercial interest; but there are a very large number that should attract the attention of the

are labelled as being made of "grass grown and plaited by natives;" the price of a single hat varies from 15s. to 20 guineas.

WESTERN AUSTRALIA.

The most remarkable exhibits in this court are the marvellously fine specimens and blocks of Jarrah wood (*Eucalyptus marginata*). A portion of one enormous trunk lies on its side, the cross section of the base of which is highly polished, showing to great advantage the beautiful deep red colour of the wood. A magnificent specimen of curly Jarrah, which has dark, wavy, transverse markings is also shown. It is called a counter top—much too beautiful, however, for such a use—and measures probably 14 or 15 feet long long, by some 2 feet or 2 feet 6 inches wide. The woods shown in this court, like those from Queensland, are exceptionally well prepared and polished. Jarrah wood is well known to be the most desirable of all woods for moist or damp situations, indeed it may be said for any situation, as it hears not only changes of temperature without injury, but it also resists the attacks of Teredo, white ant, or any similar destructive agency. As proof of its durability a specimen is shown that has been lying on the beach at Bunbury for a period of thirty-six years, where it has experienced the action of the waves, sun, wind, and sand without any apparent injury. Several other interesting woods are to be seen in this court, and one notable object is a Black Boy trunk (*Xanthorrhæa*) 20 feet high—a remarkable specimen, beside which is a fine specimen of *Kingia australis* in flower.

VICTORIA.

Here, as in the other Australian courts, the products of the genus *Eucalyptus* are very prominent. Mr. Joseph Bosisto, the President of the Victorian Commission, who has been so long and so well known for his work in the development of the oils and resins of the *Eucalypti*, is a prominent exhibitor of these products, amongst which are essential oils of *Eucalyptus amygdalina*, *E. globulus*, *E. oleosa*, *E. dumosa*, *E. citriodora*, *E. obliqua*, &c. These oils have antiseptic and disinfectant properties, and that of *E. globulus* is tonic and stimulant. Here also are cigarettes of the leaves of *Eucalyptus globulus*, recommended for bronchial and asthmatic affections; *Eucalyptus* disinfectant pastilles, the fumes of which are said to be of great service in diseases of the respiratory organs, and to have the effect of driving mosquitos out of the room. The resin of the Black Boy or Grass-tree of Australia (*Xanthorrhæa australis*) is also shown. It is soluble in spirit, producing a deep amber colour, employed in staining wood to imitate Cedar and Oak. It is stated that in Mr. Bosisto's factory in Western Gippsland 12,000 lb. of *Eucalyptus* oil are annually produced, and as many as six tons of *Eucalyptus* leaves are manipulated daily. There is a remarkably good collection of Victorian woods, each specimen having a representation of the plant yielding it painted upon it; a slab of *Eucalyptus rostrata* measures some 10 feet by 3 feet. An excellent catalogue of Victorian exhibits is published by authority, in which are many useful notes on the woods and other vegetable products.

SOUTH AUSTRALIA.

This court will best be remembered for its scene on the Murray River, illustrating aboriginals at home. A very good collection of Australian fruits, of forest trees and shrubs, are shown in table-cases, and a representative series of South Australian woods well selected and arranged in convenient-sized panels. As an illustration of the growth of the Cork Oak (*Quercus suber*) in the colony, a specimen of cork is exhibited, grown at Mount Lofly, near Adelaide, at an elevation of 2300 feet. The trees were raised from acorns obtained from Spain in 1884, and that from which the exhibited specimen of cork was taken was in January of the present year 20 feet high.

Tobacco also seems to have made some advance in the colony. An Adelaide firm exhibits manufactured Tobaccos, and the note referring to them in the South Australian catalogue is as follows:—"This firm commenced the manufacture of Tobacco in Adelaide about nine years ago, and now have a factory replete with the best and most modern machinery, which is driven by a 20-horse power engine, and the presses are worked by hydraulic pumps. About sixty persons are employed in making twist, plug, nail-rod, and other kinds and grades of Tobacco. Carpenters' and

FIG. 1.—*ABIES PINSAPO*: MALE FLOWERS. (SEE P. 8.)

be passed over in this general sketch. Woods also are very prominent in this court, as might be expected. A very good collection is shown beneath this trophy, and the trees are illustrated by a series of excellent photographs. In the centre of the court are some fine slabs of Columbian Pine. The very fine series of woods from New Brunswick are especially attractive, each wood being shown in various stages of bark in old and young wood, longitudinal and transverse sections, and on the chief panel of each wood is a painting of a branch in flower or fruit. Between the panels of each kind are small pilasters of branches with the bark on of the same tree. Some finely selected woods form this group, and among them are American Larch, Spruce, Hemlock, Maple, Beech-nut, Ash, Birch, Oak, Beech, &c. Articles in Birch bark are numerous, and on the south-west basin is a real Birch bark canoe.

QUEENSLAND.

This court is contiguous to Canada, and the first things that strike us on entering it are two magnificent trunks of Australian Cedar (*Cedrela toona*); one of these measures 20 feet 5 inches in girth, and the

cabinet maker. An excellent descriptive catalogue of these woods has been prepared by Mr. F. N. Bailey, F.L.S. (Colonial Botanist), which consists of eighty-six pages, and treats of 427 woods arranged under their natural orders and genera.

NEW SOUTH WALES.

Though the collection from this colony is very extensive, and there are some fine sections of timber, the vegetable products on the whole are not striking, nevertheless there are some interesting exhibits, for instance, a large quantity of a woolly substance like fur is labelled "Pulse from base of stalks of *Macrozamia spiralis*," a new product, it would seem, from a Cycadeous plant, used, we suppose, for stuffing cushions. A curious and interesting ethnological collection is shown from New Guinea, amongst them several singular wooden drums ornamented with festoons of the hard seed shells of *Pangium edule*, which are probably used for the rattling sound they would give when shaken, as well as for their ornamentation. One case is filled with the celebrated Cabbage tree hats made from the split and plaited leaves of *Livistona australis*. They

blacksmiths' shops are attached to the factory, so that very little work has to be sent outside."

RUSTIC WORK.

Messrs. Dick Radclyffe & Co., of High Holborn, exhibit largely at South Kensington this year. Specimens of their handiwork, arranged in a very realistic manner, may be seen in what is called the encampment at the Victoria court (the proper term or native name for which is mia mia). This encampment is an exact representation of those made by the natives when the white men first arrived in Victoria. The huts—if they can be so called—were of the most primitive description, being simply made of a few sheets of bark. They always faced the east, so as to catch the first rays of the morning sun. Some of the natives had a good idea of drawing, and they used to scratch figures of the emu or kangaroo on the smoked bark, or figures of themselves engaged in the "corroboree" (their native dance) or fighting.

Their weapons consisted of spears, shields, boomerangs, and waddies, or clubs of different shapes, and stone tomahawks. The women were clever at making nets for fishing, boomerangs, &c. This camp has been erected as it is thought it will prove of interest to many who have never seen anything of the kind before, for it is hard to imagine that less than fifty years ago the only dwellings which existed on the site of the great city of Melbourne were similar to these, and the only sounds which broke the stillness were the howl of the wild dog, the shouts of the wild man, or the stroke of his stone tomahawk. The weapons, &c., exhibited are genuine, and have, no doubt, often been used in hunting and warfare.

Another very interesting spot is the Fern cave, off the West Indian court; the rockwork to the great fountain basin is arranged by the Holborn firm.

NEW PLANTS CERTIFICATED

BY THE ROYAL BOTANICAL SOCIETY DURING THE FIRST HALF-YEAR, 1886.

* B.C., Botanical Certificate; F.C., Floral Certificate; either being equal to a First-class Certificate.

Table listing botanical specimens with columns for plant name and certifier. Includes Adiantum fragrans, Alocasia regina, Anarrhiza Clinaria, Arum, Begonia, Calceolaria, Canna, Cereus, Clivia, Cyclopogon, Dianthus, Eranthis, Fuchsia, Galium, Geranium, Gynandromorpha, Hyacinthus, Impatiens, Lelia, Lonicera, Malva, Mimulus, Nephrolepis, Oenothera, Pinguicula, Ranunculus, Saxifraga, Scilla, Senecio, Solanum, Stachys, Tradescantia, Verbena, Viola, Zinnia.

BY THE ROYAL HORTICULTURAL SOCIETY.

The following are the First-class Certificates, except those marked B.C. (Botanical Certificate).

Table listing horticultural specimens with columns for plant name and certifier. Includes Ams. in pyrenica, Anarrhiza, Arabis, Aspidistra, Begonia, Callitriche, Canna, Cereus, Clivia, Cyclopogon, Dianthus, Eranthis, Fuchsia, Galium, Geranium, Gynandromorpha, Hyacinthus, Impatiens, Lelia, Lonicera, Malva, Mimulus, Nephrolepis, Oenothera, Pinguicula, Ranunculus, Saxifraga, Scilla, Senecio, Solanum, Stachys, Tradescantia, Verbena, Viola, Zinnia.

which we understand the place takes its name, Otterspool. A shady walk, with a high bank on the windy side, runs down to a pretty Swiss chalet, just at the edge of the river, from whence may be seen the distant Welsh hills. Near the house is a lofty structure, which is principally occupied by fine Camellias planted out, some of which are from 10 to 12 feet high; the roof is covered with Roses. A range of three span-roofed houses is mostly devoted to the production of flowers for cutting; here is a beautiful lot of Eucharis amazonica in the best possible condition; a quantity of bulbous Calanthes for winter blooming, and numerous flowering and fine-leaved stove plants. One of these houses is now filled with Melons that look very promising.

Another house contains a general collection of greenhouse plants, including Fuchsias from autumn-struck cuttings, which Mr. Lindsay, the gardener here, grows remarkably well; Kalosanthos, Peltargoniums, Lilies, and the usual stock. In this house are good examples of the red and the white Lupagarias.

Next is a stove, in which, amongst other things, is Anthurium Andreanum, several examples of A. Scherzerianum, Gardenias, and other favourite flowers for cutting. At the south end of the house, close to the glass, several plants of Dendrobium moschatum are grown; in this light position they do beautifully; they were showing quantities of flower-spikes, such as this handsome, but often somewhat shy flowering species, will not produce unless grown where fully exposed to the amount of light it gets here. In another house are a large quantity of tuberous Begonias in promising condition. There is a nice selection of Orchids, including a number of Cattleyas and various other species that are growing very well.

A number of young two-year-old Vines grown in pots and turned out in one of the vineries were just colouring a good crop. Muscats, good young Vines bearing a beautiful lot of bunches, occupy a second vinery. The back wall in this house is covered with Oeanders planted out, which we understand flower profusely—a circumstance scarcely to have been expected under the conditions of shade that here exist—the heat given to the Vines no doubt affects the ripening of the wood essential to flowering. Another house has been recently planted with Vines. There is a long range of lean-to houses facing east, the first of which has Peaches on the back wall, with Axleas in front. The next is another long Peach-house, with trees similarly on the back wall, and Strawberry in front. Adjoining is a late vinery, principally Alicante and Lady Dowe's, both carrying a fine crop.

Here also are grown immense quantities of Chrysanthemums for general decorative use and for the production of cut flowers for exhibition. With these Mr. Lindsay is very successful, last year taking the highest award at Hull—£15 and a Challenge Cup.

MESSRS. R. P. KER & SON,

who in addition to hardy evergreen and deciduous trees and shrubs, cultivate large quantities of flowering and fine-leaved stove and greenhouse plants, some of which, particularly Crotons and Dracenas (as may be seen at the Liverpool show), they have made a specialty of, and which in the condition they are brought out by Messrs. Ker in the beautiful miscellaneous groups they so successfully exhibit at the Liverpool, the Manchester, and other leading shows, are examples of high cultivation.

THE LIVERPOOL HORTICULTURAL CO.

OF THIS, Mr. Cowan is the representative. Their nursery is at Garston, a few miles out of Liverpool, and is easily reached by train. Besides the ordinary nursery stock the Company have gone largely into Orchids, of which, we understand, they are in possession of large quantities, established plants, as well as those that they keep on importing.

MR. J. DAVIES, BROOK LANE NURSERY, ORMSKIRK. In addition to the usual stock to be met with in nurseries generally, Mr. Davies has identified his name with a race of sweet-scented hybrid Rhododendrons that are deservedly held in much favour, and are extensively grown. If we recollect aright they are crosses between R. multiflorum and R. Edgeworthii.

MESSRS. J. CUNNINGHAM & SON'S old-established nursery at Oak Vale has been long celebrated for Rhododendrons, many fine

ROUND LIVERPOOL.

(Continued from p. 848, vol. x. etc.)

OTTERSPOOL, THE RESIDENCE OF SIR THOMAS EDWARDS-MOSS.—There are frequent trains from the Central, or St. James's Street Stations to Otterspool Station, to which these grounds adjoin.

This is one of the most attractive places round Liverpool. The natural undulation of the grounds, which have been nicely laid out and are very well kept, coupled with the beautiful view which the river here presents, make the place at all times interesting. It is well wooded, which gives a feeling of shelter—a condition of the first importance in a locality so exposed to the western gales as this. The carriage road leads through the valley, now green and fertile, but which was once a pool leading from the river, and from

varieties of which have been raised by the veteran, Mr. Cunningham. Notwithstanding the inroads of that terrible person—the builder—who here, as in the case of many other nurseries in the vicinity of large towns, has encroached on the space, there is, we understand, still a fine collection of this favourite evergreen shrub.

Orchid Notes and Cleanings.

ODONTOGLOSSUM VENILLARIUM.

MR. RIDOUT (p. 797, vol. xxv.) has been very successful with the culture of this plant. Nine and ten blooms on a spike are the largest number I ever heard of. We have had eight flowers frequently, and some of the bulbs on our largest plants produced four spikes to one bulb, and with an aggregate of twenty-eight flowers. Mr. Ridout will pardon me if I venture to say the last sentence in his letter is rather vague. "They do best by being kept gently growing nearly all the year round." May I ask at what time of the year they are not to be kept growing? I would prefer the sentence I have quoted minus the word "nearly." I counted the flowers and spikes as nearly as I could on our large plant; but on cutting off the spikes on which the flowers were still perfect, three days ago, after the flowers had been open four weeks. I find the number is slightly understated—there were forty-nine spikes and 289 flowers. The plant was purchased at Stevens' sale rooms in February, 1875; and I may add that the bulbs and leaves produced this year are larger than they have ever been before. I see no reason in the appearance of the plant to doubt that it will be larger and stronger next year. I have now repotted it with its associates.

Prof. Reichenbach described the Orchid in the *Gardener's Chronicle* for May 27, 1872, in his usual quaint way, and was very desponding about its successful introduction and culture in England. All previous introductions up to that date had died in the passage; and the Professor says, "That will no doubt be the fate of others; new importations will be tried, though nobody can pretend [assert] without being a charlatan, and in a short time, no doubt, there will be nothing more left of it, as with so many other lovely Orchids." It was first introduced successfully by Mr. Chesterton when collecting for Messrs. Veitch of Chelsea, and flowered in the Exotic Nurseries, Chelsea, in 1873. It received a First-class Certificate from the Royal Horticultural Society on May 7 in that year. The plant had two spikes of four flowers on each. Messrs. Veitch exhibited another plant the following month, on which were two spikes with six flowers on each. This was "the largest plant yet seen." *J. Douglas.*

A THREE-ANTHERED CATTLEYA MOSSIE.

A singular form of this well-known Cattleya was handed me the other day by way of a curiosity. The sepals were involute at the sides, but otherwise normal, while the petals were altogether wanting. The apex of the column exhibited the unusual phenomenon of bearing three anthers. The central and normally situated one was perfect, and contained four pollinia, although it was smaller than is usually the case. The lateral pair, although seriously deformed, proved on inspection to be real anthers, developed undoubtedly by separation from the column. Whether this separation was in any way materially assisted by the absence of the petals may remain an open question. Both cells of the anther were in each case present, but only the outer one contained a full-sized pollen mass. The others were much smaller, or altogether absent, while the loculi containing them were small and more or less fleshy. The pollen masses were much softer than usual, and easily separable into the normal groups of four pollen grains, which the microscope showed to be of unusual size, but thin walled and nearly transparent. The connective, or what corresponds to such in typical stamens, was much enlarged, petaloid, fleshy, and rose-coloured, with a median dark line. A strong nerve could be detected continuous with this, and extending to the base of the column. The labellum was somewhat malformed, but otherwise normal. *J. P.*

PHALENOPSIS FROM MR. PHILLBRICK'S GARDEN.

The Oldfield Orchids are, as our readers know, celebrated for containing many gems of the great Orchid family, and which are almost always well grown by Mr. Heims, Mr. Phillbrick's gardener. As instances of remarkable development under culture we have been favoured with the sight of a flower of *Phalænopsis graoiflora*, of the unusually great depth of 4½ inches in the sepals, and the same width across the petals. The bloom is delicately suffused with purple, although the aspect at a short distance is that of a white flower. The side-lobes of the lip are yellow instead of rose coloured, as in *P. amabilis*. The other flower is *P. Sanderiana*, also of a large size, 3½ by 2½ inches, a fine flower for this species. The colour is of a deep purplish-rose, veined with deeper tints of purple. We cannot remember to have seen a deeper coloured flower.

COTTONIA PEDUNCULARIS.

Little or nothing seems to be known respecting this curious and interesting Orchid in gardens, and no notice is taken of it in gardening dictionaries and other publications, such as Loudon's *Encyclopædia of Plants*. There are a number of plants in Sir George Macleay's garden, Pendell Court, introduced from India, some of which have been flowering for a considerable time. Two distinct species, or at most three, are all that are known belonging to the genus. The largest and most important is that under notice with a branching flower-stem bearing numerous dark coloured flowers. There is an uncoloured figure of it in Wight's *Figures of Indian Plants*, vol. v., t. 1755, under the name of *C. macrostachya*. Lindley is the authority for the accepted name, and the plant would seem to enjoy a considerably wide distribution in India and Ceylon. The sepals and petals in the living specimen examined are narrow, pale brown, revolute at the margin, and relaxed. The most striking feature of the flower, however, is the resemblance the labellum bears to that of some species of *Ophrys*, such as *O. bombylifera*. It is oblong in outline, slightly constricted in the middle, hairy or pubescent at the sides in the lower half, deep brown, almost black, and shallowly bifid at the apex with a tooth in the notch. This organ is also notable for a curious depression about the middle on the upper surface, and a small bifid or toothed crest near the base. This latter is shown in the figure quoted, but no notice is taken of it in the description furnished by the *Genera Plantarum*. The linear, lidid, rigid distichous leaves remind one of a *Saccolabium* or *Acidèle*.

SELF-FERTILISATION OF EPIDENDRUM VARIEGATUM.*

THE curious method of fertilisation exhibited by this plant deserves notice as being somewhat singular, since it is effected in every case by purely mechanical means. The lip is so situated in proximity to the column that it can exert pressure on its under-side, and the anther is held in place by projecting horns which hinder it from being easily detached. Without being in any way displaced from the anther-case, the pollen masses become enlarged and consequent upon the pressure of the lip against the column are squeezed so that they distend laterally inwards and thus come into contact with the stigma. The lip even when bent back with some force, returns to its place with a strong spring, and it would therefore be impossible for any but a very large insect to exert sufficient force, to effectually separate the lip and the column and give room for the admission of the pollen masses. Besides if sufficient force was used as to detach the anther case, it would in most instances fall from the flower, carrying with it the pollinia—owing to the peculiar form of the lip. In the course of some four years, during which the growth of this plant has been carefully watched, no instance has been observed in which the flowers have failed to fertilise, and the anther-case has always remained attached to the column, together with the persistent flower until the seeds are ripe and the capsule bursts—a circumstance tending to prove that fertilisation is self effected.

The plant itself, according to Lindley in *Folia Orchidacea*, appears to be very variable; he places it in * *Osmophytum*, to which its near allies, *E. fragrans*

* *Epidendrum variegatum*, Hook., *Bot. Mag.*, t. 3181. *E. curvatum*, Hook., *Bot. Mag.*, t. 2392. *E. cristatulum*, Popping and Emul., *Nouv. Gen.*, 11, p. 1, t. 102, according to Lindley in *Folia Orchidacea*.

and *E. cochleatum*, also belong, and to the former of which it bears a great resemblance, being scarcely distinguishable except when in flower. *J. H. Hart, Superintendent Government Cinchona Plantation, Jamaica.*

NURSERY NOTES.

GLOXINIAS AT MESSRS. HOOPER & CO.'S, TWICKENHAM.—Although these are now past their best, yet the remainder of what must have been a grand sight is well worth seeing. Messrs. Hooper & Co. are renowned for their Gloxinias, and justly so. The strain seems a very good one, although the foliage would not suit every one's taste, many preferring those with drooping foliage, which hoods over and covers the pot; but if the plants be grouped this character is not noticeable. With only one or two exceptions the plants are of the erect-flowering type. The colours of Messrs. Hooper's strains leave nothing to be desired, and defy description; all shades of red and blue abound, and mixtures of both colours are seen. A noticeable variety is one named *reticulata*, having red spots on a white ground, and a brilliant patch of carmine at the junction of the lobes of the corolla. The throat is of a reddish coloured ground, having delicate pencilling of a deeper shade. The carmine spot gives it a very attractive character.

Another variety (unnamed) has a most curious appearance. First, there is a pink band all round the corolla, which is much crimped and fringed. The flowers look at first sight as if they are fading. Next this band is a deep crimson ground shading off into a chrome-yellow in the throat. If not beautiful, this form is at least peculiar, and worthy of cultivation. "Distinction" is a name given to a handsome large-flowered variety with regularly formed flowers; the edging is of a pale violet, succeeded by a dark band, thus gradually streaked off on a pure white ground. The name which has been applied is very appropriate. We noticed one plant which had flowers with a white edge, then with a band of red, and running through most brilliant shades of red and violet to a decided violet in the throat. Another mixed form was most delicate. A pure white rim was followed by a patch of a mixture of colour, beginning with a very pale pink, and then gradually becoming streaked over with pale violet, with a reddish tinge, succeeded by white running down the throat, which towards the base is spotted with an indescribable reddish-blue. Contrasting with these highly coloured forms a plant with perfectly white flowers, with the exception of the yellowish-green throat, attracted our attention. The colour of the throat was so clear and fine that it set off the otherwise white flower to great advantage. The foliage of this plant completely covered the pot, and the entire plant was most pleasing. Numerous other forms are to be seen. It is difficult to make selections for special remark from among so many beautiful forms. Both pale and dark coloured forms are plentiful. The greater number are red flowers, but still blues are by no means rare. There are spotted forms of both colours, which are both numerous and good, having fine large flowers, which are perfect in form. The plants now in flower are all last year's seedlings, and have made good healthy plants, producing abundance of flowers. Besides these in flower at the present time Messrs. Hooper have a large batch of young plants now coming on, and which promise to be as great a success.

BEGONIAS AT MESSRS. LAING & CO.'S.

The Begonias at Forest Hill are again a special feature, and give promise of being as great an attraction as ever. They have been flowering for some time in great profusion, and will continue to do so during the season. The number of plants now being cultivated in the houses and planted out is enormous, amounting to something like 200,000, 18,000 of which are doubles. In the show-houses, filled with Begonias, there are about 1000 plants now in full bloom, and which present a very imposing and gorgeous spectacle.

The single-flowered varieties are of great size—too large, to our taste—6 and 7 inches in diameter being about the average. The plants are very healthy, growing vigorously and producing flowers in such profusion that they seem masses of colour; a house filled with such plants as these in all their various shades of red and yellow, and pure white, can only be imagined, not described. The same may be said of

the double forms—only, of course, they are not of such great dimensions. We took special note of a few of the most attractive forms, among which were the following:—Illustration, a double bronze-yellow, slightly flushed with salmon-pink; *Virginalis*, a double white, a most desirable variety, the flowers being erect; *Randolph*, also a double of a most rich deep and brilliant carmine-crimson colour. It is a free flowerer, but has one slight disadvantage, in having long stems. A double creamy white flower of a good regular form is *Marchioness of Stafford*. Mrs. Amy Adcock is a double pale crimson with a white centre; this is a very pleasing variety. A variety that has been frequently noticed before is *Davisi hybrida*, fl.-pl., but it is of such a rich red colour, and so graceful in appearance that one cannot pass it by without notice. *Charmier* is one of this year's seedlings, and has been twice certificated. It is a single white, with a rich crimson edge. The flowers are large and plentiful. Truly it is well named. A plant of a somewhat novel character, having red flowers with the lateral segments tipped with white, has received the title of *Piebald*. Of the white-flowered class, a specially pleasing one is *White Perfection*, with large pure white flowers. These are a few of the most noticeable, but where so many varied and beautiful forms are so abundant it is impossible to enumerate all. To appreciate them thoroughly they have to be seen, and we would strongly recommend lovers of these popular flowers to pay a visit to Forest Hill, and judge for themselves.

MESSERS. KELWAY'S HERBACEOUS PÆONIES.

The remarkable collection of cut blooms of these, shown by Messrs. Kelway & Son, of Langport, at the meeting of the Royal Horticultural Society on the 22d ult., must have come to many persons as a great surprise. These dashing hardy flowers are represented in many gardens only by the well known crimson form, that the wide range of varieties shown on this occasion, not only by Messrs. Kelway & Son, but by Mr. T. S. Ware, Tottenham; Messrs. Barr & Soe, Covent Garden; Messrs. Paul & Son, Cheshunt; and Messrs. E. H. Krelage & Co., of Haarlem, ranging in colour from shining deep maroon to pure white, through many intermediate shades, must have astonished some gardeners as well as the general public. The fact is that Kelway & Sons are so constantly raising seedlings that the varieties increase rapidly, but it is only on occasions like this that one has an opportunity of seeing not only how large and fine the new forms are, but how greatly they vary in colour. And what a sight it must be at Langport to see 5 acres of Pæonies in bloom; and that there may be the best opportunity for comparison, two plants of each variety are put out every year, in addition to a large number of seedlings.

Some patience is required in raising seedling Pæonies. The seeds take one or two years to germinate. The plan adopted at Langport is to sow them in the spring in drills in a cold frame, but wide enough apart for plants in pots to be placed between them during the winter. Here the plants remain till they are two years old, and then they are planted out in the open ground to bloom. Another space of two years is required before they flower in a satisfactory manner; and so some amount of patience is required, like that exercised by raisers of Tulips. The soil at Langport is a heavy loam resting upon a bed of gravel, and it seems difficult to imagine one better adapted for the growth of Pæonies.

Varieties are increased by root division. This is done about November, when the roots are broken or cut up into pieces, much as those of *Rhubarb* are, but each piece must have an eye, or no plant can be expected; and what holder, more showy, and striking hardy border plant have we flowering in June than these herbaceous Pæonies? They are accommodating in the matter of soil, but in a good deep loam they do remarkably well. What a range of varieties there is to select from is shown by the fact that Messrs. Kelway & Son catalogue something like 320 varieties. These are all double flowers; in addition they have a list of seventy-two single varieties.

Of the double forms the following are extra fine:—*Lady L. Bramwell*, silvery-rose, extra fine, large and full; *Mymotus*, deep crimson-maroon; *Acanum*, bright rosy-purple; *Lactatus*, pale rose; *Beatrice Kelway*, having broad pink guard petals, and a white centre; *Feronia*, pure white; *Papinus*, bright purplish crimson; *Ahora*, pale purplish-rose; *Princess*

Beatrice, broad, bold pink guard-petals, the centre creamy-white and pale pink; *Frances*, delicate pink, margined with white; *James Kelway*, rich, shining maroon-crimson; *Princess Patricia*, broad white guard petals, and delicate primrose centre; *Mortia*, pale peach; *Carnica*, delicate rose; *Lady Carrington*, blush, the centre petals having a distinct Picotee edge of red; *Macella*, the guard petals lively rosy-pink, broad and bold; the centre a bunch of thin golden petals, a few of them tinted with purple; *Princess Henry of Battenberg*, shining maroon, very fine; *Princess of Wales*, delicate pink, margined with white, extra fine; *Prince of Wales*, pale lustrous, maroon; *Orbus*, delicate rosy-purple, extra-fine *Verulon*, deep pink, paler on the edges; *Silenus*, bright rose; and *Alboui*, soft peach. This is a selection of the leading varieties in a large and varied collection.

A few of the most attractive of the single-flowered varieties will be found in *Prince Alexander*, pale rose, large golden tassel in the centre; *Milais*, bright deep rosy-purple; *Princess Victoria*, delicate blush, almost white; *Pnetus*, bright crimson; *Crimson Gem*, pale purplish-crimson; *Queen of May*, pale rose; and *Catulus*, bright purplish-crimson. These are but a few, there are other varieties varying in colour.

A WATER FUNGUS: MITRULA PALUDOSA, FRIES.

FEW fungi of the summer and autumn attract more admiration than the pretty little fungus here illustrated (fig. 2). It is the Marsh *Mitrella* (*Mitrella paludosa*, Fries), which grows upon dead leaves, moss, and twigs, as they float in quiet drains and other water places.

FIG. 2.—A WATER FUNGUS: MITRULA PALUDOSA, FR.

The stem is white and slightly hollow, or piped, and the club-shaped top is orange in colour and stuffed. There is a perfectly white variety, named *M. alba*.

The majority of fungi only require a moderate amount of moisture for their sustenance, for instance, too much moisture is fatal to *Mushroom* growth, but the plant before us cannot live unless it grows in a semi-submerged condition. A second fungus, the allied *Vibrissia truncorum*, Fries., grows in similar positions on submerged wood as does *Peziza clavus*. *Mitrella* is an *Ascomycetous* fungus, i.e., the spores are all borne in sets of eight within transparent bladders or "asci," which asci completely invest the surface of the top or "pileus." The distinction is an important one, as in the *Club fungi* found under *Clavaria*, the spores, which grow in fours, are all free, i.e., without any microscopic investing bladders or sacs.

Mitrella paludosa, is remarkable for its singular habitat, pretty form, and beautiful coloration. It is not uncommon in some of the pretty water-courses of Wales, Devon, Cornwall, &c. *H. G. S.*

CAMPANULA ALLIONI.

This is a very beautiful *Campanula*, remarkable for its mode of growth, the rootstock being creeping, rooting into the soil and sending up shoot stems with linear sessile leaves, and relatively very large, bell-shaped, violet-blue flowers about 1½ inch long. These flowers grow singly at the ends of the branches. Sir Joseph Hooker remarks (*Botanical Magazine*, t. 658), that the creeping rootstock adapts it well for its habitats, which are the moving slopes of soil at the base of precipices. It is a native of the Alps of Piedmont and Savoy. Our illustration (fig. 3) is from a drawing of M. Sendtner of Munich.

REPLANTING VINERIES.

ANY one having Black Hamburg Vines in the early or second early houses, which, through old age or other cause have not yielded satisfactory crops during the last year or two, I would strongly advise to cut all the bunches as soon as the berries are ripe with 9 or 10 inches of wood attached to each bunch, the ends of which should be placed in bottles of water (having a few small pieces of charcoal in each) in the Grape or other cool room. This done root out the old Vines, remove the soil from a narrow strip of the border, say 5 feet wide or less, see that the drainage is all right, placing over it a layer of turf, grass side down, and afterwards fill the space excavated with a compost consisting of five parts of good tuffy loam, one of wood ashes, one of lime rubble, one of fresh horse-droppings, and about an ordinary sized garden barrowful of fresh soil, mixing the whole before using. In preparing the border make allowance for the soil subsiding 5 or 6 inches within as many weeks from the time of making it.

PLANTING.

Before doing this clean the structure thoroughly, washing the walls with hot lime-wash. If the cultivator be not provided with home-grown Vines of course he will have to buy them from some firm reputed for the cultivation and sending out of clean, healthy plants. These, when thoroughly moist at the roots, should be turned out of the pots and the soil all round the ball of roots and earth slightly loosened and be then planted at 3 feet apart about 1 inch deeper than they were in the pots, making the soil firm about them. In planting them put a support to each, and fasten them to the trellis, but leave the ties long to allow of the subsidence of the soil. This done, give tepid water through a rose to settle the soil about the roots, and afterwards give a slight mulching of rotten dung. Shade the Vines with mats for a few days, until the roots have taken to the new soil, and with this object in view, and to freshen up the foliage, which, under the circumstances, will show signs of flagging, damp them slightly overhead three times a day until they have made fresh growth, after which morning and afternoon will be often enough, damping, however, the surface of the border, pathways, &c., twice during the interval, during bright sunny weather, to promote a growing atmosphere.

Assuming that the Vines have been stopped once or twice during the last few months, and that in each case the laterals resulting from the said stopping have been pinched out as soon as they appeared, thereby causing the latent bud at the base—which, if the laterals had been allowed to grow, as is frequently the case, would not move until next year—to push into growth after the lapse of eight or ten days, the sap in the meantime will be necessarily directed to the development of both stem and buds below. Thus treated, a uniform plumpness of buds is secured the entire length of the rods. When the Vines so stopped have made 2½ inches of fresh growth, stop them again in the manner indicated, and repeat the operation to the end of the growing season, except in the case of temporary Vines, which are to be cut down after they have fruited next year, these may be pinched hard at 8 feet from the bottom of the trellis; but should there be any danger of the buds in the axils of the leaves bursting, a few of the laterals and sub-laterals near the top of each rod so disposed can be allowed to grow to draw off the sap and thus prevent the fruit buds from pushing into growth. In order to concentrate all the energies of the individual Vines in the thickening of the rods and the enlargement and consolidation of the buds proceeding from their bases, the lateral shoots springing from the same source must be stopped at the first or second joint, as also should the sub-laterals, and those which may afterwards appear should be pinched close back. These remarks are also applicable to that portion of the Vine between the ground and the trellis to insure uniform thickness of main stem from its base. Better results will be secured from Vines so treated than would be the case from rods, the laterals of which have been allowed to grow uninterruptedly during the previous season with a view to encouraging a corresponding amount of growth at the roots.

Vines thus treated will reach the top of the rafters before the end of the season, and may be allowed to bear a few bunches each next year. This method of procedure has everything to commend its adoption,

seeing that a crop of Grapes is taken from the old Vines this year in sufficient time to establish young ones for carrying a crop next year. Remarks on the watering of the borders, ventilation, temperature, &c., will be found at p. 687, vol. xxv. *H. W. Ward, Longford Castle.*

Florists' Flowers.

THE CARNATION AND PICOTEE.

It is very interesting to observe the influence of different seasons on the plants under our care. Sometimes the weather is propitious; more frequently it is the reverse; but, whatever may be the difficulties we have to contend with, sooner or later the flowering season will come. "While the earth remaineth, seed time and harvest, summer and winter, day and night shall not cease." We may take the same

weather. The pest may be destroyed by dusting with tobacco-powder, or if the plants are under glass by fumigating with tobacco-smoke. Some flowers when fully expanded are much injured by tobacco-smoke: the Carnation and Picotee blooms receive no injury whatever from it. I like to keep up a succession of bloom for as long a period as possible, and for that purpose a few plants are placed in a warm house; these are now in flower, and very beautiful they are, especially some of the brighter coloured selfs. During the spring months I depend upon the perpetual flowering varieties to keep up a succession of bloom until the summer flowering type come into flower. Many intending exhibitors will probably read these lines, and those who have plants in pots should place them under glass as soon as the flowers show colour; but it is well to bear in mind that they must not be shaded too much, and the nearer they can be placed to the glass the better. The house should be freely ventilated night and day, and merely shaded from bright sunshine. Those who have not the convenience of a house in which to

fancier will find many hours occupation in attending to his plants during the months of June and July. There is disbudding, tying the stems to the sticks, brushing off green-fly, trapping earwigs (another troublesome insect, which eats the petals through at the base, and when the flowers are cut the petals drop out). The old fanciers place cards to the flowers on which to display the petals, which some tasteful persons do not approve of. This is a matter for private consideration. I never use manure-water at any time during the growth of the plants, nor when the flowers are expanding.

Those intending to form a collection of the best varieties should attend the exhibitions of the several Carnation Societies, North and South. They can there see the best varieties exhibited, and purchase those that take their fancy. Every Carnation and Picotee grower ought to be a seedling raiser, and proving the seedlings is one of the most interesting of the many details of the fancier's work. The work must be done in a methodical manner. The plants from which it is intended to save seeds should be placed, if possible, by themselves, and they ought to be hybridised every day when in flower; and in attending to this necessary operation of the gardener's art a good deal of judgment is necessary. Not only must the very best varieties extant be selected as seed and pollen bearers but the classes ought not to be mixed. The Carnation and the Picotee are each subdivided into six classes, exclusive of the yellow ground Picotees, and it is only proper that the scarlet bizarre Carnations should be kept by themselves; and the same holds good to the end of the chapter. The seeds ought to be sown about the first week in April over a hotbed; they will very speedily vegetate, and must be pricked out in boxes 3 or 4 inches apart, to be planted out in the open ground as soon as they are large enough. They will form large, handsome specimens, if they are allowed 18 inches each way, and the quantity of flowers they produce is truly astonishing; we have had upwards of 200 on one plant. A few of the very best varieties must be selected to grow again, and the best way to preserve them is to dig up the plants and pot them. The layers on such plants usually form roots much more freely than they do on those that have been grown in pots all the year round. Each plant will produce on an average about twelve layers, which may be tested in various positions next season; some may be grown in pots, and others planted out in the open ground, to prove their adaptability as border plants. For this purpose the self-coloured flowers are the most popular, they are better adapted to cut for placing in bouquets, &c. Many will come white. I had from 700 seedlings last year, three or four very fine white varieties raised from the ordinary flakes and bizarres; this at first sight seems very extraordinary, but we must not forget that both bizarres and flakes are white, that is, they have a white ground, more or less pure, on which the colours rose, red, purple, maroon, scarlet, &c., are deftly laid out in flakes and stripes. *J. Douglas.*

FIG. 3.—*CAMPANULA ALLIONI*: FLOWERS BLUE. (SEE P. 12)

promise to ourselves, in reference to the choice flowers we cultivate. Seasonal difficulties we shall always have, and the present season has not been a favourable one by any means. We have always boasted that the Carnation and Picotee stand any amount of frost if the plants are kept dry; but I certainly found the weakly plants were considerably injured this year, although those with a vigorous constitution passed through the trying spring very successfully. I can generally tell in May whether they are late or early, for this reason: most of the plants are placed in cold frames at a uniform distance from the glass, and about the 1st of May they have usually grown so much, that the lights cannot be moved off without injuring the rising flower-stems. This year they were quite three weeks late at that time, and the weather since has not been favourable to rapid growth.

In ordinary seasons the general Carnation bloom is at its best near London about July 20, but we have had such adverse seasons recently that this date is not to be depended upon; on one occasion we had to place the plants under glass to get the flowers in by August 7. Green-fly has not been so troublesome this year as usual, nor have we as yet seen any black thrips; these latter do considerable damage in very hot

place their plants may have a few frame-lights to spare. The plants may be arranged on a bed, a row of posts should be driven into the ground on each side of it; the tops of the posts ought to be 9 inches higher on the north side than they are on the south. A rail should be nailed on the top of each row of posts to support the lights. Some shading material may be nailed on to the posts to prevent winds from blowing underneath; but it ought not to be fixed quite to the top of the posts, leave about 6 inches all round for ventilation. It is necessary to throw some very slight shading over the glass during bright sunshine when the flowers are open. If they are shaded too early they lack colour.

Many of the best varieties of Carnations and Picotees have a tendency when well grown to burst their pods; this is a serious fault, as a flower with a pod split down one side is an unsightly object. It is caused by the pod being too full of petals; and may be prevented by slitting the pods down a little on the upper side; it is the under side which always splits, and, as a further precaution, some of the flowers may be tied round the calyx with a strip of matting. During hot weather the plants require plentiful supplies of water at the roots. The Carnation

COLONIAL NOTES.

A RAMELE AMONGST TREE FERNS.

RECEIVING an invitation to make one of a party or the above purpose I soon came to a conclusion on the matter. After a railway ride of some forty miles the station was reached, where waiting I found a conveyance, two horses in tandem, and a lady driver. Here allow me to digress a moment for the information of your fair readers in England. These horses, with others, had been trained personally for this lively and uncommon way of driving by this young lady of some seventeen summers, and right well had she performed her task; the secret of her success, I afterwards learned, being kindness and fearlessness. Such is her influence over these animals that they refuse to allow gentlemen to saddle or ride them. Whilst chatting on the subject of long drives with horses she merrily replied, "But mine are food of them!" but she added, "they require to be driven judiciously." After a thirteen miles' pleasant journey, we came to our rendezvous—my friend's homestead, which lies nestling on the confines of an immense forest. (Here, I found vinerias with their luscious fruits ripe (when invitations are doubly acceptable), and pot plants of no mean order, Coleus,

Begonias in variety, Petunias, Fuchsias, Pelargoniums, &c.—the flower and fruit garden, in harmony with the surroundings. Darkness shortly afterwards put an end to further inspection. After the usual preliminaries next morning, we started on adventure No. 1. Here the early morning impressions are, that hardly anything in Nature can exceed the wild, weird grandeur of these primeval forests, grey with the ravages of untold storms—standing as they do memorials of many centuries of time, having given shelter to the Moa bird (now since extinct) and the Maories alike. We came across a forest giant, the Totara [*Podocarpus Totara*], which had been felled a few days previous to our visit, and which measured 9 feet in diameter across a fresh-sawn cut 2 feet from the ground, and which was calculated to have close upon 1000 rings or to have grown as many years. Here we soon found some of the objects of our search—*Cyathea dealbata*, towering above the Dicksonias, and vying with them for the supremacy. Here also were two other varieties of *Cyathea* which we could not determine. In close proximity we found growing in marvellous profusion, *Pteris lucida* and *P. scaberula*, with *Gleichenia Cunninghamii*, locally called the Umbrella Fern. In this immediate neighbourhood, in small rivulets, we found, almost hidden in verdure, that charming Queen of Ferns, *Todea superba*, and the *Todea hymenophylloides*. The latter is certainly the most handsome, with its graceful fronds fully 2 feet in length, and its beautiful plumose pinnae. To see these in their native habitat undisturbed, is something to admire and remember. Here also we came across a veritable bridge of live Ferns, *Terns* Fern cut down and laid across each other (with minor ones interlaced), and growing notwithstanding their prostrate condition; for so tenacious are they of life in their native habitat that they insist upon growing whether standing upright or lying down. Frequently we came across them where they had been ruthlessly cut down and left, afterwards growing exactly the shape of an immense tobacco-pipe, with its bowl upright, 3 or 4 feet in height.

At every turn huge *Polystichums* and *Pteris* barred our progress. The chief feature of this forest is that you are constantly meeting with groups of different species of Ferns. There is a carpet of dwarf ones, such as *Doodias*, *Blechnums*, and *Aspidiums*, which seem almost barbarous to trample upon. Further on the nodding plumes of the tree species seem to court your admiration, until your sense of discrimination gets amazed, and your note-book of memory fails. There also we came across the New Zealand Mistletoe, suspending itself exactly like the English one in tufts, but unlike it in one respect; it seems here at any rate to attach itself to only one species of tree. There is some controversy as to whether it is a real Mistletoe [*Loranthus* sp.], certainly it is a parasite, and, therefore, of the order *Loranthus*, for we closely examined its structure; leaves tough and leathery, 2 x 1 inch, entire, acuminate, and red berried. At this auspicious moment a shower of rain checked our further progress, and we retreated for lunch.

Our next adventure (No. 2) was a more serious undertaking—no less than the ascent of a creek some 20 yards wide, and about 2 miles in length—a rushing stream, with numerous rough and large boulders. The first glance convinced us it would be a slow, difficult, and uncertain journey; but we had two lady guides, and therefore could not honourably retract; so we donned bush costume, and prepared for the worst. This creek is arched over with, of course, evergreens in all stages of life and decay, conspicuous amongst them being the *Grisselinia littoralis*, the New Zealand Laurel, festooned with lichens and mosses, the latter drooping 2 feet in length; clinging also to these were *Asplenium flaccidum* and *A. bulbiferum* in friendly combat for the mastery with *Polypodium Billardieri*, and *tenellum*. Each side of this creek is walled in by rocky terraces, draped with Ferns of many species and varieties; amongst others we recognised *Cytiumium falcatum*, *Lomaria Patersonii*, *L. Fraseri*, *L. procer*, *Polystichum angulare*, *P. proliferum*, *Pteris longifolia*, with its stately fronds; and several *Nephrodiums*—indeed, here fernhood had certainly run riot. Occasional breaks in these terraces revealed witching glens, contributing their tiny sprays into our noisy stream. Still scrambling higher, after frequently emptying our boots of clear cold water, we came upon a peculiar and distinct variety of *Lycopod*, furnished only with a simple wiry thizome in unlimited lengths; about

every 12 inches it pushed a single strong rootlet into the soil, and threw up a spreading frond or branchlet, resembling a miniature tree moss. Pushing our way still higher up we came upon a gem, the rare *Hymenophyllum filicifolium*, with its delicate tracery and black spores, the finest of the filmy Ferns, fronds 12 to 15 inches in length. Here also (for we were getting nearer the foot of the ranges and therefore more and more in the shade) was *Acroporus hispidus* in abundance, and the neat little lace *Asplenium*. The terraces were now becoming more perpendicular, the result being that mosses and lichens were taking the place of Ferns, and lovers of these might have revelled in delight, so beautiful were the specimens. Climbing was now becoming difficult, when a sudden bend disclosed a charming cataract some 14 feet clear fall, a miniature Niagara; this blocked our further progress upwards. After an interval of rest we decided upon our return journey, which we found as difficult as the upward one. After a damp and exciting struggle we reached our starting point, where we found our faithful quadruped waiting to convey us to less exciting scenes, and where we soon satisfied our eager appetites. *T. Smith, Timaru, New Zealand.*

FORESTRY.

THINNING.

THE thinning of young plantations, more especially such as are being operated upon for the first time, should now be taken in hand and continued till about the end of August. This is all the more necessary in recently formed woods at high altitudes, as by thinning during the summer months the remaining trees are better able to withstand the succeeding cold weather than when the work is performed at the usually specified time in the autumn or winter. Of course this rule must not in all cases be applied generally, as it is well known that timber cut during the summer is inferior as regards lasting qualities to that felled at any other time. In thinning elevated plantations let the work be executed with great caution, as the results occasioned by the free ingress of cold winds are oftentimes serious in the extreme. Rather thin often, and remove little at a time than undergo any risk, and pay attention that the outer line or lines on the exposed sides are left thicker than those within the woodland. Collect the poles in lots, keeping each kind separate, and arrange according to size. The lots had best be formed along the sides of the clearance roads, and where facility for removal is guaranteed. In such woods the branches may be of but little value; still, for the health of the trees and tidiness of the woodlands they had better be made into faggots, and either sold at once or carted home and stacked for winter use in the mansion. By so doing all forest produce is utilised, and the ever increasing insect pest kept considerably in bounds.

HEDGING.

Now is the time to prune with a sharp switching knife all sorts of hedges—Yew, Box, Privet, Thorn, Beech, or Hornbeam—and at the same time it will be advantageous, and, perhaps, obviate the chances of its being forgotten altogether, to thoroughly clear the ground along the base of each, freeing it from all rank weeds—indeed, weeds of any kind—and removing any dead or dying plants and twigs. Collect the prunings with a rake into heaps, and either have them conveyed to some suitable place for such rubbish, or burned on the spot. In the case of Yew prunings, or, indeed, those of Laurel and Rhododendron, the best way is to reduce them to ashes on the ground, as all three are highly deleterious to farm stock generally. Yew branches in particular should never be allowed to lie about within the reach of horses, cattle, or sheep; and it is likewise well to remember, that in a half dead state the foliage of this tree is even more dangerous than when newly cut. In cleaning along the base of fences, the hoe and rake are, perhaps, preferable to any other tools, although good results frequently follow a shallow digging of the soil, but in so doing take great care not to come in contact with, nor to injure the surface roots. Bear in mind that clean kept hedges, and such as receive an annual trimming, will last much longer, and form a more impenetrable fence with less cost for repairs and attendance than those which are allowed to run wild and have their own way. Lawn and nursery

hedges may receive two trimmings annually, one in early June, and the other in August, thus keeping them at all times in a neat outline and inducing a close even growth. *A. D. Webster.*

The Flower Garden.

PELARGONIUMS.

WHERE the necessary home-accommodation for wintering bedding Pelargoniums in 4-inch pots exists, it is present is the best time to begin propagating for next year. Select a sheltered situation with a good exposure to the sun, and one well provided with drainage. Throw this into 3 or 4 feet beds; get a mixture of leaf-mould and sand in about equal quantities, and mix this with 2 inches of the soil in the beds. On this the cuttings should be pricked off from 2 to 3 inches apart. They will be rooted by the usual time, and ready for potting up in August. This is a capital plan for saving labour in the busy months of spring. With this plan only about one-half the usual quantity of Pelargoniums are needed to fill the beds, as the plants are much larger and they flower more abundantly than when struck later on in the autumn.

SUB-TROPICAL BEDS.

Special attention must be given here, in order to induce the plants to make a vigorous growth, they must receive copious supplies of water and a mulching of well rotted manure. See that all tall growers as *Cannabis*, *Kic'nas*, *Wigandias*, &c., are securely staked. Frequently stir the surface of all flower beds with the hoe, or where that is impracticable with a small hand fork. This is of great importance, especially where water has been artificially applied. Flatten down edgings of *Cerastium* and clip them into proper shape; this is frequently requisite in order to keep it in proper trim. *Santolina* will often require the same treatment, or else it will soon out-grow its proper bounds.

RANUNCULUS.

should be lifted out of the beds as soon as the foliage and stems turn yellow, or else they are apt to gain start into growth. These are best stored in sand and placed in a cool shed or cellar.

CREEPERS.

These should have their shoots thinned and regulated as growth proceeds. Lay in sufficient young growths to furnish all bare spaces, and expose them well to the influence of light and air, in order to have the wood well ripened for next season's display.

HEDGES, &c.

Clip hedges into the desired shape, also plants which are used for the embellishment of Italian and geometric flower gardens. These are cut into all sorts of architectural figures, but I must confess I never saw any beauty about them; they are too stiff and formal. Sweet Bays and Laurels are better trimmed with the knife, as the shears mutilate the foliage, causing it to turn brown on the edges.

SOILING, &c.

A sowing of *Mignonette* and many other of the hardy annuals may still be made. For late flowering stake any of the tall growing kinds, to prevent them falling over. A good sowing of *East Lothian Stocks* should also be made at once. If these be pricked into a cold frame, wintered with slight protection, and planted out in spring, they will be in full flower by the middle of June, and will continue flowering throughout the summer. Divide and strike cuttings of any new plants which are scarce. *W. M. Baillie.*

PLANTS AND THEIR CULTURE.

COLOURED-LEAVED PLANTS.

The foliage plants in this department, such as *Alocasias*, *Marantas*, *Athuriums*, *Fittonias*, *Cyanophyllums*, *Sphaeroglossums*, &c., will be much benefited by having frequent waterings of liquid manure. Keep the syringe well at work amongst the plants, regulating the young growths as they come up, otherwise some of them will get crippled in pushing through the older foliage and stalks. A watch must be kept for fly on the young leaves. *Cyanophyllum*

magnificent and *Spherygne latifolia* must be kept in the shadiest part of the house. All the above plants are moisture and shade lovers, but shading must not be used more than is necessary to prevent burning or discoloration of the foliage. For *Crotons* plenty of light, heat and moisture are the conditions most favourable to their growth; to ensure this the plants should be freely syringed both morning and afternoon, shutting up early so as to husband some heat. The plants should now be making rapid progress, and liberal supplies of water at the root will be required. *Crotons* are well adapted for table decoration, especially those with long, narrow and spiral foliage when grown with a single stem in 6-inch pots.

CALADIUMS.

Caladiums should now be growing away freely; any small bulbs or eyes which were not ready some time ago for potting should now be potted. Caladiums do best in loose rough soil, such as fibry loam, leaf-mould or peat, and few plants are more effective during the summer months than are dwarf starchy specimens of these. A selection should be kept in suitable sized pots, so as to be available for decoration when wanted. If the plants be subjected to plenty of light, their stems and leaves will become much stouter and stronger, and the colouring much brighter and more fully developed than when shade is employed beyond what is absolutely necessary to keep them from burning.

DRACENAS.

These most accommodating plants may now be set in any cool structure, provided they have been prepared for it during the past few weeks, by being gradually hardened in a drier and more airy house. There are few if any stove subjects that will stand the sudden changes of temperature and hard usage that the *Dracenas* will. There are now so many varieties, and the range of colour in their leaf markings is so wide, that a fair collection should be in every establishment where summer or winter decoration is required; and although the *Dracena* stands the effects of usage indoors with impunity, it is advisable to change them as often as possible. *A. Evans, Lythe Hill.*

THE ORCHID HOUSES.

DENDROBIUMS.

The house we set apart for these runs east and west, and as we use the thinnest tiffany for shading, that is fixed on the outside, so that the sun can exercise its full power on the plants grown in this way. They will stand a much stronger fumigating when grown thus, providing all the plants are moist at the roots. It has been thought by some persons that *Dendrobium thysiflorum* and *D. densiflorum* are injured by being grown in too much sunlight, and that spot is induced; but I think there is some other cause for the spot on the leaves. Many of the *Dendrobiums* will now be far advanced in growth, and will be making fresh roots from the base of the new pseudobulbs; those that are looking extra strong might require a small shift if they are under-potted, but should be disturbed as little as possible in the operation, for if the least check is given to the plant it will often start another growth instead of finishing the first, and with our short summers it requires very great care to mature these late growths. The *Dendrobiums* are better for being confined at the root, and usually succeed better when overpotting is avoided. I find the best way to treat large plants, if they have lost their roots through the soil getting sour, is to pot them back into much smaller pots, and then plunge the pot in a larger one, filling up round it with crocks, and covering the surface with lumps of peat and moss; but I do not think it good practice to place one basket inside another if it can be avoided: for the wood soon begins to decay when buried, and rapidly causes the whole compost to be unfit for the roots to thrive, besides breeding injurious fungi. Any of the plants in baskets where the material at the roots is getting sour might have this picked out carefully with a small pointed stick, and be top-dressed with live sphagnum and fibrous peat. Any specimens in pots that require more room place the pot inside a larger one, and fill round with crocks and top-dress. It is not prudent to break the inside

pot when a plant is making growth nor to make a larger hole in the bottom, as nearly all the new roots of these Orchids show themselves on the surface. With regard to *D. Wardianum* and *D. crassinode* it does not seem to make much difference whether they are in pots or baskets, or if suspended from the roof or standing on the stage when the house is a very light one. *D. Jamesianum*, *D. infundibulum*, and *D. longiorum* grow and flower well on the north side of our *Dendrobium*-house at the cooler end, the bottom ventilator near them being left open night and day during the warm weather. *D. Cambridgeanum* is allowed to flower in this house, it being afterwards taken into the house where the *Lycastes* are grown and hung up near the glass until spring, when it starts to grow, it being then taken back into the *Dendrobium* house proper. *Epidendrum arachnoglommum*, *E. xanthinum*, and *Cyrtopodium punctatum* all enjoy the sunny house in which the *Dendrobiums* grow, and *Thusias* grow and flower well here also. There are some *Dendrobiums* which are found to do best when started in more heat than those already named, and taken into a cooler house when they have nearly finished their growths. Running out on one side of our *Phalaenopsis*-house is a narrow very sharp pitched span-house, in which such *Dendrobies* are suspended from the roof: here they have the same temperature as the *Phalaenopsis* at night and in dull weather; but when the sun shines the shading is put on for a time in the morning and rolled up early in the afternoon, so that the *Dendrobiums* have plenty of sun without its doing harm to the other plants in the house. The following are those that we treat in this way:—*D. Ainsworthii* ×, *D. albo-sanguineum*, *D. Penzance*, *D. bigibulum*, *D. Brymerianum*, *D. Harryanum*, *D. Lowii*, *D. luteolum*, *D. McCarthyi*, *D. Phalaenopsis*, *D. rhodostoma*, *D. splendidissimum*, *D. superbiens*, *D. Dearei*, *D. devonianum*, *D. endocharis*, *D. Findleyanum*, *D. formosum giganteum*, and a few others. As bright warm days may now be expected keep plenty of moisture about the *Dendrobies*. A very simple way to charge the air with moisture is to take a well packed syringe, and placing one finger over the jet, exert pressure sufficient to disperse a very fine spray on to the roof, at the same time walking backwards, and not directing the water on to the plants, but letting it fall all around. The plants are not injured in the least, although the sun may be shining hotly, if the shading be of the thinnest. It has been necessary recently to keep the fires going in the warm divisions of the *Orchid*-houses, so as to keep the East Indian house at about 70° at night, and the *Cattleya*-house with a little air admitted at about 65°. The ventilators in the *Odonotoglossum* and *Masdevalla* houses can be left open night and day. *A. Woolford, Downside, Leatherhead.*

The Kitchen Garden.

SEAKALE.

THAT intended for forcing should be looked over, and where there are more than two growths to a plant the surplus ones must be removed; and if extra fine Kale be desired, one growth only should be retained, and any flower-spikes that may make their appearance should also be cut out. Keep the ground clean between the plants by hoeing until the leaves meet overhead. As a top-dressing for this plant apply nitrate of soda at the rate of from 4 to 5 cwt. per acre.

GLOBE ARTICHOKE.

These will now be throwing up their flower-spikes, and also a quantity of suckers; and with the object of throwing as much strength as possible into the blooms, the latter should be removed, with the exception of from three to four for next year's yield. Great advantage would result if during dry weather these could be copiously watered with liquid-manure, and afterwards mulched with rotten dung. In some instances it will be found necessary to thin out, not only a portion of the flower-spikes, but also some of the too thickly placed flower-buds, in order to obtain large, fleshy, well-developed flower-heads.

ASPARAGUS.

As a rule, cutting for this season will have ceased; the beds therefore, should be thoroughly cleared of

weeds before the foliage has become too dense. This may be accomplished either by a light sufficient top-dressing of salt, or by hoeing and hand-weeding; and in any case a good top-dressing of "Fish," or some other approved artificial manure, should be applied after discontinuing cutting. This is the most efficacious and best method of applying a stimulant to *Asparagus* during summer. When means and convenience will allow, waterings of liquid-manure or sewage during hot weather would be most beneficial, and its effects more lasting; but as applications of this kind could only be possible in certain cases, and under certain conditions, top-dressing, as described above, is the most practical, and therefore most generally adopted method of summer dressing. Where the aftergrowth is very luxuriant, and attains some considerable height, and is consequently exposed to the force of the wind, some support should be given, either by stakes and tying, or by placing forked stakes amongst the foliage, similar to those used for Peas. Failing either of these methods, the latest and most exposed growths can be shortened from 2 to 3 feet with a knife.

VEGETABLE MARROWS.

Those that were planted in dung-frames for an early supply, and that have been allowed to run from under them, can now have the lights and frames removed entirely. Clear away all old discoloured leaves and weakly growths, and regulate and peg down the leading shoots, that they may root and assist the parent plant. Ridge Cucumbers will likewise require attention in much the same way, and both will want plenty of water during hot weather.

HERBS, &c.

Shallots and Garlic will soon be ready to lift, which will be apparent by the withering of the foliage; after being pulled they should remain on the ground for a few days, in order to get firm and thoroughly dry, and afterwards cleaned over and stored. All herbs required for use in a dry state must be cut as they come into bloom, and should be spread thinly on boards in any dry airy structure, and kept turned until thoroughly dry, when they are best tied up into convenient bunches and hung in a suitable place ready for use.

GENERAL WORK.

This will mainly consist of attention to growing crops, in removing all refuse, and clearing the ground from a previous crop and preparing it for a successional one. Borders being cleared of Cauliflowers, after being forked over, come in well for French Beans, Early Horn Carrots, &c., for late autumn supply. After early Potatoes, Turnips, small kinds of Summer Cabbage, Coleworts, &c., make a good succession. The two last-named can be pricked out from 3 to 4 inches apart, in rows a foot asunder, and afterwards thinned to proper distances for successional purposes. Plant out all kinds of Kale, Broccoli, Cauliflowers, and also a late batch of Brussels Sprouts.

WATERING.

This will be necessary during hot weather, particularly in the case of newly transplanted subjects and seed beds; and in the event of continued dry hot weather some of the more permanent crops will also be much benefited by liberal supplies of water, which when once commenced must be regularly given until rain falls. All watering outside should be done as late in the day as possible, and the water used for the purpose should, if possible, have been exposed to the action of the sun and air. *John Austin, Witley Court.*

ORANGES IN VALENCIA AND CORDOBA.—The Orange crops in Valencia, Spain, appear to be suffering much from the competition from the large and increasing crops from Florida and California; thereby closing the United States markets to the Valencia crop. The loss of this outlet causes excessive exportation to Great Britain, and consequently unremunerative results. The quantity of Oranges exported from Valencia during the season from November to June amounted to about 2,000,000 cases. From Cordoba, however, the bitter Orange is exported in increasing quantities. It is much grown in this district, and during the last five years the produce grown has increased from 2000 boxes to 6000; one box contains 500 Oranges. They are all shipped to London and Liverpool, and are used for making marmalade.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY,	July 6	Show of the National Rose Society, at South Kensington. Sale of Imported and Established Orchids, at Protheroe & Morris's Rooms. Royal Caledonian Horticultural Society's show (two days). Richmond (Surrey) Horticultural Society's Summer Show.
WEDNESDAY,	July 7	
THURSDAY,	July 8	Sale of Imported Orchids from Mr. F. Sander, at Stevens' Rooms. Rose Show, at Brighton Aquarium (two days). Rose Show, at Westminster Aquarium (two days). Sale of Imported Orchids, at Protheroe & Morris's Rooms.
FRIDAY,	July 9	

A SUMMER sun, an extensive and varied exhibition should render the PROVINCIAL SHOW OF THE ROYAL HORTICULTURAL SOCIETY at LIVERPOOL a great success. At any rate the Society deserves to succeed, for it has gone into the matter with spirit. Mr. BARRON has worked with his usual quiet energy and careful method, and he is well seconded by his staff, and by that of the Liverpool Botanic Garden. The exhibition held in Wavertree Park, adjoining the Botanic Garden, and in communication with the "Shipperies," was formally opened on Tuesday last by Sir DAVID RADCLIFFE, the Mayor, at the request of Sir TREVOR LAWRENCE, the President. Some complimentary remarks passed between the two notables, and the opportuneness of so agreeable a neutral ground being provided for the warring politicians of the time and place was appropriately commented upon by both speakers. The exhibition is, as we have said, large and varied. If we miss some features which render the Ghent Quinquennials so remarkable—the Palms, the Cycads, the Tree Ferns, the outdoor exhibits—these deficiencies are in a measure supplied by the adjacent Botanic Garden, upon which we have reported in a previous number. The details of the show must be looked for in another column; but we may here allude to some of the more prominent features. The principal part of the exhibition is held in a huge tent of four bays, well filled and well arranged, but from its flatness lacking variety on a first impression; the canvas covering it is too opaque, and in dull weather would seriously interfere with the effect, but under a broiling sun, such as we had on Tuesday and Wednesday, this was of little consequence. Other tents are devoted to fruit, vegetables, cut flowers, and miscellanea, while in the grounds are implements, boilers, and the farrago of varieties one generally sees on such occasions.

Foremost we must mention the Orchids. These are mainly contributed from the neighbourhood of Liverpool, and they constitute a display never before equalled at a provincial show of the Society. Mr. HARDY takes the lion's share of the honours, followed by Mr. HARVEY. The former gentleman wins the 25 guinea cup—Lancashire "Le coop."

Next to the Orchids the most important exhibit is constituted by the Crotons exhibited by Messrs. KER, of Liverpool. These are magnificent plants, well coloured and well grown. Stove and greenhouse plants are fairly well represented by well grown, well bloomed specimens, and Ferns, excepting Tree Ferns, are well shown. British Ferns prove their right to take part in such displays, and Messrs. BACKHOUSE's filmy Ferns constitute the most remarkable collection of the kind for variety and numbers that we ever remember on such occasions. Messrs. R. P. KER & SONS send a group of Bromeliads that makes one wonder why our exhibitors do not more often show these plants. Messrs. J. LAING & Co. show a fine lot of Caladiums. New plants, to our regret and surprise, are scarcely represented, and together with the comparative absence of Palms, Tree Ferns, Cycads, and the

like, testify to the change that has come over public horticultural displays of late—a change which, while it favours a few specialties, such as Orchids, Roses, and market-plants tends to ignore subjects of more general and varied interest; but this is an accident of fashion and of commerce.

Herbaceous plants are exceedingly well represented by choice collections from Messrs. BACKHOUSE, PAUL & SONS, and HARVEY. Messrs. BARRON & SON of Elvaston, contribute a fine collection of choice well grown specimens—Conifers in tubs—one of the finest exhibits in the show, though not comprising much novelty. The same firm also shows a small but fine collection of standard and other Hollies. Tree Carnations are well shown, especially by Mr. LEOPOLD DE ROTHSCHILD; Mr. TURNER of Slough has also a good set.

Cut flowers comprise Roses, in which the Tea section is splendidly represented. A glorious set of Peonies is shown by Messrs. JAMES DICKSON, of Chester; and Messrs. KELWAY, of Langport, have also a fine lot. Bouquets and table decorations comprise nothing of special importance, the good ones are light, feathery, with the flowers well individualised; the bad ones are, as usual, lumpy and crowded. Fruit is weakly represented, and vegetables, though of excellent quality, are in smaller quantities than we expected.

Garden literature, a novel feature in these exhibitions, was very poorly represented, very few of the curiosities of literature being represented, and modern books being only imperfectly shown. Landscape-garden plans were numerous, some very ill suited for the purpose, but others, though presenting no special feature, apparently well designed.

Mrs. CUSSONS showed some bold, free drawings of Roses on panels, and Mrs. HARRY TURNER may be recommended for her vase, decorated with a painting of JACKMAN'S Clematis, but other exhibitors in this class were scarcely up to the mark, and some ill-advised persons must needs deface and obscure looking-glasses by attempting to paint flowers on them.

Messrs. CARTER & Co. show a nice collection of annuals; Messrs. JAS. DICKSON & SONS, and Messrs. BARRON of Elvaston, have a fine series of ornamental foliage trees which makes us wonder such beautiful and interesting plants are so much neglected.

Messrs. VEITCH'S group of miscellaneous plants was deservedly admired, consisting of a background of noble Anthuriums, such as Veitchianum, Warocqueanum, and others, with masses of Hydrangea paniculata grandiflora, Hemanthus hirsutus, the white variety; a small group of carnivorous plants in fresh condition, the blue Exacum macranthum, Nephrolepis rufescens tripinnatifidum, and other choice plants being interspersed.

The greenhouses and boilers present nothing that we need note in a general sketch like this, but Messrs. WEEKS show a very ingenious arrangement for heating a living room. It consists of an arrangement of water-tubes at the back; the fire is open by day, and at night by the application of a *couvre feu*, or curfew, is converted into a slow combustion apparatus, by means of which the heat is retained for a long period without need of attention to the fire.

For a full report of the exhibition, and the meetings held in connection with it, we may refer to other columns of this issue.

THE results of the competition for the PRIZES TO YOUNG GARDENERS offered by this journal and presented at Liverpool on Wednesday last by the President of the Royal Horticultural Society, as reported in another column, are, on the whole, very satisfactory. Considering the number of candidates there are very few essays that can be considered bad; almost all attained what we may call a fair average, and a few were certainly considerably above what could fairly have been expected. In estimating the value of the papers we bore in mind the opportunities, circumstances, and positions of young gardeners in general, and we laid special stress, by allotting double marks

to evidences of original or independent observation, and to the application of the facts of botany and vegetable physiology to practical cultivation.

The essays were all sent in marked by a motto or other device by which the writer could be identified, an envelope marked in a similar way, and containing the writer's real name and address, being sent with the essays. None of these envelopes, except those belonging to the successful candidates, have been opened. As usual on such occasions, there was little relative difficulty in allotting the first and second prizes, but much more in determining which should take third place. In fact, there were several that were nearly equal, and it required repeated examinations to determine which was entitled to precedence.

Of the remaining essays little need be said. Some were good in some points, weak in others, few or none wholly bad. Many of them are defective in the knowledge of root-structure, the long-explored notion of "spongioles," unfortunately retained in many modern gardening books, being still adhered to. This points to a defect in many garden books which we have often had occasion to note.

From what we have seen, we feel confident that all the candidates will have been benefited by the competition. It has evidently called forth their powers of observation, excited their interest, awakened new ideas in their minds, and brought home to them a sense of what they had less perfectly realised before—the cardinal importance of the root and its action in matters pertaining to the cultivation of plants. If this be so, and we believe it is, then not one of the candidates will regret having entered upon the competition. Some have discovered that "Science" is, after all, only orderly knowledge, and now express their surprise at the opinion held by some that there is anything antagonistic between knowledge and practice, as if the best practitioner were not he who combines the fullest knowledge of his subject with the greatest capacity of applying it in practice.

The 1st prize of £10 is awarded to—

P. SEWELL,

Royal Botanic Garden, Edinburgh; whose paper is very good, and illustrated by excellent drawings.

The 2d prize of £5 is awarded to—

HARRY A. BUNYARD,

Royal Horticultural Society's Garden, Chiswick.

The 3d prize of £2 is adjudged to—

JOHN DUNCAN,

Royal Botanic Garden, Edinburgh.

All the essays whose receipt has been acknowledged have been read and re-read, and in some cases read a third time. The three first, to which prizes were awarded, have been already mentioned. Two of them were illustrated by excellent drawings. The following comments have been made on those which failed to reach the prize standard. Many of these are nevertheless very meritorious, and they have been classed in three groups, as under:—

First-class.

"Industry is the Key to Progress"; relatively deficient in cultural matters.—"Adscriptus glebe" shows unusually good knowledge of what a root really is, but is weak in cultural matters.—"Altiora Peto" and "Spes et Perseverantia" must have worked in the same garden, if not at the same desk.—"Primrose": a good essay, but smacking too much of mere book learning.—"May Flower": a good essay, which would have attained a higher place had the writer not wandered so much from the subjects laid down in the programme. "May Flower" has evidently acquired much information, and we hope we may meet with him again as a writer.—"Tantum Amor Florum" sends a good paper, especially in the practical portions.

EATON HALL.

THE PHOTOGRAPH BY MR. J. W. BARNES, 11, FLEET STREET, LONDON, E.C.

Second-class.

"Vinca": a good practical paper, but the chemistry would have been better omitted.—"Bucks" shows considerable powers of observation, but his inferences are often questionable.—"Strathearn" shows a good

Third-class.

"Nihil" need not apologise for his handwriting, which, if not elegant, at least is legible—a matter of much greater consequence; "Perseverance," good in cultural matters, but otherwise defective; "Picotee"

Hlex;" "Omega" "thinks he has said enough;" is that why he uses the last letter of the Greek alphabet for his device? He has evidently taken pains, but under the circumstances he will not be surprised if we do not class him A 1. "Water-pot": your

FIG. 4.—WELLINGTONIA GIGANTEA AT WANSFELL, WINDERMERE. (SEE P. 18.)

knowledge of root-form. Query, did not the ice form on the germinating seed? What proof is there that the seed actually germinated in the ice?—"I. J. C." is commended for what he has done, but he has overlooked many points; a similar remark applies to "Excelsior," who will have to get higher yet, though he seems to be on the right track.

asks for sympathy and encouragement, and he deserves it—his knowledge of root-action is good, but he has not sufficiently brought out its application to practice; "Caractacus," "Laoy Dell," "A Would-be Botanist," "Whittingtonian," "Ad Valorem" demand no special note.

Unclassed.

"Nil Desperandum I." (nine pages); "Quercus

can wants filling up. "Perseverance leads to Success": so it does. "Tibolt's" practice to his superior officer we cannot commend. "Nil Desperandum II." (five pages): we agree that you should have a good groundwork to root in, and we commend the spirit of observation and experiment you manifest. Let your practice be based on correct observation and judicious experiment, and you

will never despair. "Dendrobium densiflorum" has apparently got his information from some obsolete book; his notions of the action of roots require, in many respects "radical reformation." "Eugenia" is no doubt right when he says that if we understood better how plants grow naturally, we should be more successful in growing them. "Nil Desperandum III." (five pages) should certainly not despair, but he will have to improve his knowledge of root structure and action. "Natura est artis magistra" has a fair knowledge of structure, but some departments are not touched at all; "Cambrian" is short indeed; "Live and Learn"—we hope he will; "Salopian" goes a little too far when he assigns consciousness and thought to roots. The remaining essays do not call for special remark.

— JOHN LEECH'S PICTURES.—In reply to a desire very generally expressed that the date of execution should be appended to each of JOHN LEECH'S pictures, we learn that the publishers intend to provide this information in a comprehensive index at the end of each of the volumes, so as not to confuse and in some degree disfigure the pages by the continual intrusion of dates.

— EXCURSION OF BELGIAN HORTICULTURISTS.—A Belgian tourists' agent is about to personally conduct a party of horticulturists to London, its environs, and some of the midland and western counties, including Elvaston, Chatsworth, Liverpool, Eaton Hall, Trentham, &c. The date fixed is from July 15 to July 25. The programme sketched out for the excursionists has been furnished by "honorable Sir ROBERT HOGG." It is to be regretted that our Belgian visitors did not time their visit so as to be present at the Liverpool show. The Colonial Exhibition does not figure on the programme.

— THE BOILER CONTEST AT LIVERPOOL SHOW.—An account of this competition will appear in our issue for next week, the trials taking place too late for the publication of results this week.

— WELLINGTONIA GIGANTEA.—O. O. WRIGHT, Esq., Bridge Hall, Bury, Lancashire, sends us a photograph taken by his son, and which we now reproduce (fig. 4, p. 17) of one of eight Wellingtonias now growing in his sister's garden at Wansfell, Windermere. These eight specimens were purchased in the autumn of 1864, and were so small when planted that an old man and boy carried them on a hand-barrow from a local nursery garden situated about a mile off. The specimen which is here represented is now 40 feet in height, has a trunk circumference of 8 feet, at 1½ foot above the ground, and its spread of branches close to the ground is quite 10 feet all round. Another specimen out of the same lot is an equally noble looking tree, being 42 feet high, 8½ feet round the trunk, and is one mass of greenery from its summit to the ground.

— PAPER PULP FROM YUCCA BREVIFOLIA.—An English company started in San Francisco for the purpose of converting the *Yucca brevifolia* into paper pulp, has, it is said, suspended operations for the present, the venture having proved unsuccessful. Notwithstanding the failure of this company, it is confidently stated that the business can and will yet be made to pay handsomely.

— RESULT OF THE NITRATE OF SODA PRIZE.—The following has been forwarded to us for publication:—Carrying out the scheme of prizes offered by the committee of the Saltpetre Producers' Association (Comité Salitro à Iquique, Chili) for the best popular essay treating of the importance of nitrate of soda as a manure, and the best mode of its application, the judges—Professor L. GRANDEAU, Nancy, France; Professor ADOLF MAYER, Wageningen, Holland; Professor D. PETERMANN, Gembloux, Belgium; Professor G. THOMS, Nizh, Russia; Professor PAUL WAGNER, Darmstadt, Germany; Mr. R. WARRINGTON, Rothamsted, England—have made the following awards:—1. To the essay with motto "Grua, theurer Freund, ist alle Theorie," a partial prize of £350 (7000 marks). 2. To the essay with the motto, "Pour pratiquer l'Agriculture . . ." a partial prize of £150 (3000 marks). On opening the accompanying envelopes the author of the first essay was found to be Dr. A. STUTZER, Principal of

the Agricultural Experimental Station at Bonn; and the author of the second essay, M. A. DAMISEAUX, Professor in the Agricultural Academy at Gembloux. It should be remembered that essays competing for the second part of the prize offered—namely, £500 for the best essay treating of the same subject on the basis of new, personal, experimental investigations—must be sent to one of the above-named judges on or before January 1, 1887.

— LESCHENAULTIA BILOBA.—Notwithstanding all the panegyric statements that have been made with regard to the various species of this genus, and especially the one under notice, they continue to be meagrely represented in British gardens. The same thing applies to the whole order Goodenivce containing some highly beautiful and extremely interesting little plants, generally considered difficult to cultivate. This is the fault of *L. biloba*, figured in the *Balanical Register*, 28, 2, and flowering in the temperate-house pits at Kew. The deep blue flowers with a yellow bearded throat are really fascinating. The corolla of course is split to the base on one side, and the wedge shaped, unequal sized segments are deeply bifid at the apex, with a tooth in the notch. The whole plant does not exceed a foot in height, and is much branched, with slender twiggy branches densely clothed with linear very small leaves. Careful attention must be given not to over-water this and allied plants. VEITCH & SONS of Exeter, who first flowered this species in Britain, obtained a large Silver Medal for it from the Horticultural Society. The name was formerly spelt *Lechenaulia*, and L. Drummondii and *L. grandiflora* are synonyms of this species.

— COLONIAL AND INDIAN EXHIBITION.—At the Conference held on Wednesday, June 30, Professor W. FREEM read a paper on "Colonial Forestry," in which, after referring to the inquiries of the Select Committee on Forestry, and to the scheme which had been submitted to it by the Secretary of the Surveyors' Institution, respecting a national school of forestry, he proceeded to deal with the present condition of forestry in the larger colonies. In Canada there is need of conservation of existing forests, and of tree planting over the vast prairie regions; several of the provincial governments have already moved in the matter, and everything now seems ripe for the establishment of a department of forest conservancy under the Dominion Government. In New South Wales the Forest Conservancy Branch is under the Minister of Mines, and was established in 1877. There are 5,399,513 acres of land set apart as timber reserves, equivalent to 2.7 per cent. of the area of the colony. The salaries and expenses of the officers of the conservancy amount to nearly £10,000 per annum. The total expenditure from 1877 to 1884 was £75,923, the revenue, £85,992. Nurseries are being established for the propagation of the most suitable trees, indigenous and foreign. In Victoria, 652,367 acres of State forests, and 285,334 acres of timber reserves are, in conformity with the State Forests Conservancy Act, placed under the Department of Agriculture, but even this area is not commensurate with the demand for timber for industrial purposes. In 1883, the revenue from woods and forests was £8580, and expenditure £2538. In South Australia, the Forest Conservancy is under the Commissioner of Crown Lands, and was established in 1876, since when the revenue has practically balanced the expenditure, and upwards of one and a half million trees have been added to the property of the Colony at an actual cash disbursement of only about £2000. The approximate value of permanent improvements is £115,000. The area devoted to forest purposes is 159,000 acres. In 1884 the Conservancy distributed gratis more than 200,000 young trees, at least half of which survived transplantation, and cost the Colony less than ½d. each. In Queensland there are twenty forest rangers under the Department of Public Lands, with 1,572,752 acres of proclaimed timber reserves, and 202,575 acres of reserves for State forests. One reserve is used as a plantation for growing seedlings for distribution. In New Zealand, out of a total area of 66,394,400 acres, 34 million acres of Crown lands still remain, of which 10 million acres are forest. Under the New Zealand State Forests Act, 1855, a Forestry Department has just been started, and is placed under a responsible Minister of the Crown, who acts as Commissioner of

State Forests. The Government assists planting on the part of landowners, by subsidy or otherwise. In Cape Colony, by an Act passed in 1876, public bodies are allowed half their expenses in tree cultivation. There is a Superintendent of Woods and Forests, and conservancies have been established at Knysna, King William's Town, and in the Western Division. To encourage planting, over one million trees are raised annually in nurseries, and distributed gratis or at low rates. It is believed that the Crown Forests would, if regularly and carefully worked, produce a revenue of at least £355,000, the sum which leaves the colony every year to pay for imported wood—for imported railway sleepers alone, £83,000 was expended in 1883, £44,000 in 1884, on American and Swedish timber. In Australia and Cape Colony, English forest trees are being successfully cultivated. In all the Colonies the reckless waste and wanton destruction of former days have given place to wise systems of conservancy, such as are worthy of tree-loving people.

— GARDENING APPOINTMENT.—Mr. THOMAS TOWNEND, lately under Mr. GLEN, Wentworth Woodhouse, Rotherham, has been appointed Gardener to the Hon. Lady ALICE EWING, Coed-Derwen, Bettws-y-Coed, North Wales.

DISEASE OF LARCH AND PINE SEEDLINGS.

The accompanying letter, from Mr. Brace, of Salbris, was sent to the Editor with numerous examples of diseased infant Larch and Pine plants which had just emerged (in some instances only half emerged) from the seed-coats:—

"The few Pine seedlings forwarded to the Editor of the *Gardeners' Chronicle* are of this season's sowing, and are attacked by a virulent form of fungus. I would feel greatly obliged if you could kindly aid in identifying the fungus, and give me any information as to the cause of its appearance, &c. I attribute it chiefly to the unusually cold and wet season that we have had. It has been felt most severely in the seeds of *P. Laricio*, in which I have lost fully 25 per cent.; but it attacks also *P. sylvestris* and *P. austriaca* as well. At present it seems to be dying out, but I am still in great fear of its breaking out again. Now that a little drier weather has set in I am about to try the effect of flowers of sulphur out of a sulphurator, as the only remedy that I can think of as likely to succeed. A plant that is visibly attacked seldom shows signs of life after the third or fourth day. It does not attack transplanted seedlings. My partner, Mr. David Cannon, forwarded samples both to Paris and Versailles for identification, but it seems to be hitherto unknown."

Our correspondent's letter speaks for itself, it correctly describes the presence of a virulent fungus which grows in the cotyledons and even in the radicle of the infant plants. The fungus has perfected itself and burst through the cotyledons; in some instances before the latter bodies were free from the seed-coat.

The accompanying illustration (fig. 5, p. 19) shows at A one of the infant plants with the disease spots, natural size. At B the junction of the base of the cotyledons with the radicle is shown, enlarged 10 diameters; here the burst condition of the cotyledons is clearly seen. At C portion of the same part of the attacked plant is shown, enlarged 40 diameters; and at D free spores are shown, enlarged 400 diameters. The action of the fungus is to completely exhaust and drain the cotyledons, and leave them in a condition like tinder. The diseased seedlings of course all die.

The fungus on the Larch seedlings is *Cœoma laricis*; that on the Corsican Pine, *C. pinitorum*; the Silver Fir is attacked by *C. Abietis pectinatae*. All three species are closely allied, and the disease spots to the unaided eye look like minute "red-rust" patches.

Mr. Brace's letter is of great importance, as it adds one more instance to the many brought forward by me of parasitic diseases being hereditary in plants, or, in other words, of the germs of the disease being present in the seeds, and so reproducing the disease in the seedling. In bad cases the seedlings die, in mild cases (*i.e.*, where the seeds are slightly diseased) a diseased progeny is the result. The fungus in this instance must have existed in the seeds before they were planted, or the quite perfect fungus could not have thus effectually destroyed them almost at the moment of germination. *Worthington G. Smith, Dunstable.*

PEACH-WALL TREE COVERS AND THEIR MANAGEMENT UNHEATED.

OWING to the partial failure of the Peach crop on walls of 1879 and previous years, I obtained the consent of my employer to have erected one of the above structures. I consulted Mr. Hope, of 55, Lionel Street, Birmingham, our horticultural builder, who submitted a plan and estimate for the same, which were highly satisfactory, and were accepted. I give the end elevations of the structure to show the ventilation, which I consider so necessary (see fig. 6). The total length is 140 feet, and 5 feet wide; it is constructed of red deal, and glazed with 21-oz. glass; the front wall is arched, so that the trees have plenty of root-room. It is provided with ample ventilation, as all the lights open both top and front, the means of ventilation being of the most approved system of shifting levers and screws. The back wall is wired, and planted with Hale's Early, Royal George, and Walburton Admirable Peaches; Lord Napier, Elrage, and Pitmaston Orange Nectarines. The whole length of front is planted with May Duke Cherries, trained as cordons, on four wires running the length of the house, I had another of these most useful structures erected in January, 1884, of which I give a section to show the means of ventilation (see fig. 7). This is upright, the same width as the other, and 95 feet in length. This is also well provided for in the way of ventilation by the same means as the other, with this exception, that a portion of the front lights are fixtures. The back wall of this is planted with a few, Prince of Wales, Walburton Admirable, and Lord Palmerston Peaches, Pitmaston Orange, Prince of Wales, Humboldt, and Elrage Nectarines. The front of this I use for growing a large quantity of Tomatos in pots. I have given a full description of both these tree hovers, as I have no choice between them, the one being equally as good as the other for the purpose they are intended for.

Now a few words as to their management. After the pruning, tying in of the trees, and whatever other work is required to be done, I always keep the ventilators open day and night, so as to keep the trees as backward as possible, and do not close them till the bloom can no longer be kept back. I give the borders a good soaking of water before the trees come into bloom, and afterwards keep them thoroughly dry till the fruit is all set. By doing this a good crop of fruit can always be obtained from these structures. The apparent loss of time in the early part of the season can be made up by early closing after the fruit is all set, and so help them forward in this way. I always find the fruit from these structures of large size, beautiful in colour, and of the highest flavour, and are much appreciated, and they can be either forwarded or retarded according to requirements. The supply with us from other heated Peach-houses and these structures generally continues from the first or second week in May till the end of October. I should say that the kitchen garden here lies very high, therefore exposed, and all crops are very late in consequence. I need not enter into further detail of their after management throughout the season as it is precisely the same as other Peach-houses, but the few remarks I have made I find in practice of the utmost importance till after the fruit is set, and for a permanent structure I can highly recommend either of these kinds of Peach wall tree covers. *Edward Ward, Hoveell Gardens, Brounsgrove.*

HOME CORRESPONDENCE.

Liliums.—A week ago, after a month's absence in Scotland, I looked over our Lilies. My friend, Mr. McIntosh, many years ago established the fact, that whatever the season may be, *L. auratum* and a good many other species will bloom year after year if planted among healthy *Rhododendrons*, the reason, I believe, being that the *Rhododendron* leaves shelter the young shoots from April and May frosts, and from what is still more dangerous, bright sunshine after them. When gardeners speak to me about difficulties with Lilies, I recommend them to keep to this safe ground, that is, when not many dozen plants are required. But as our experiments have for years past been in the direction of growing Lilies more in masses, and as this has been an unusually trying

season, I think that you may like to have some of the results we have arrived at. Having acquired a strip of wood at our cottage garden near here, we, three years ago, dug out the soil for some large beds about 5 feet deep, made a sheltering bank of the natural soil, filled up the holes with good Lily soil, and planted a number of *L. auratum* bulbs. These were successful; therefore the following year we made more similar beds and planted them with *L. auratum*, *L. speciosum*, *L. tigrinum*, *L. elegans*, *L. Krameri*, *L. Batemani*, and *L. longiflorum*. These prospering, we last year made another large bed, and planted it with *L. auratum*. In all these beds the Lilies, with the exception of *L. longiflorum*, look as healthy as if they had had the advantage of *Rhododendron* shelter. There is no protection overhead, but the surrounding wood was thick enough to protect the plants from the bright sunshine in May which follow the night frosts. At Oakwood, Wisby, two beds—in which *L. auratum* had come up constantly stronger, in one since 1881, the other since 1882—have a good many Lilies damaged. Some *L. cordifolium*, which had fine strong shoots at the

send a few further notes when more of the Lilies have flowered. [We do care.] We planted *L. tenuifolium* in all sorts of soils and situations. It has bloomed on all through with different strength; it will require another year in the ground before the best treatment can be ascertained. I will close this note by saying that a few days back I saw a stem of *L. Krameri* in one of Mr. McIntosh's *Rhododendron* beds with nine flower buds. It may be remembered that when *L. Lily* was introduced it was considered one-flowered; I ventured to predict that as it strengthened it would have more flowers, but no one ever dreamed of nine. *George F. Wilson.*

Royal Horticultural Society's Certificates.—In the interest of gardening I am always ready to protest when a well-known plant receives a First-class Certificate under a new name. Such is the case with the plant lately certificated as *Doronicum Draytonense*. This plant was described and figured in the *Gardeners' Chronicle* on the authority of one of the staff at Kew, about three years ago, by the name *Doronicum plantagineum* var. *excelsum*. Before and since that time it has been largely distributed under the name of "Harpur Crewe." It is supposed to have appeared as a spontaneous seedling in that gentleman's garden about ten years ago; and in accordance with the rule proposed by some influential members of the Royal Horticultural Society that garden varieties should be called by fancy names, has generally been called in gardens "Harpur Crewe." If, however, it is to have a Latin varietal name, the name given to it at Kew ought to have the preference. *C. Wolley Dod.* [A good figure was given in our pages, September 8, 1883, and a description at p. 230 of the same volume. Under these circumstances, by the action of the law of priority, it should be called *D. plantagineum* var. *excelsum*, and the name *Draytonense* suppressed. Ed.]

Protea cynaroides.—This is the most remarkable of all the species for the size of its flowers, which are almost as broad as the crown of a man's hat, though the stem is often not more than a foot high; their colour is a pale pink, found on flats and on top of Table Mountain. These are plants at Kew first collected by Miss North in 1833. It is stated that Mr. Hubbard grew his plant in a cold north greenhouse. *H. Watson.*

Schizopetalum Walkeri.—A few days ago we came upon a single specimen of this plant in flower growing under a Peach wall (outside) with a southern aspect, and among a lot of young Cabbage plants and weeds. Would you kindly say in the journal whether the plant has become lately more naturalised in this country, or whether it is of rare occurrence. I presume the seed comes over with Wheat from Chili. We have always had a good deal of *Claytonia perfoliata* in this garden for the last fifty years. *S. Walkeri* has never been seen before. "Liverfool." [We have never heard of this plant becoming naturalised. Ed.]

Tulips late in Flowering.—How unusually late the florists' Tulips have been in flowering this season is shown from the fact that Mr. S. Barlow, J.P., writing from Cobhill House, on June 21, writes: "During all my experience of thirty-seven years at this late locality I have never seen a Tulip so late in the season as June 20 before this year, and to-day, June 21, I am sending off several boxes to my friends of good, late, sound Tulips." One of these reached me by parcel post, containing some two dozen fine fresh flowers—bizarres, roses, and bybleniums, with some charming breeders, and they look as if they will keep in water in a cool place for several days to come. *A. D.*

Ferns.—I have this week had the pleasure of examining a very beautiful variety of *Adiantum gracillimum*. It was a seedling in the collection of Mr. E. Moorhouse, gardener to Mr. G. H. Nelson, The Lawn, Warwick. It is even more delicate and graceful than its parent, the ribs being very black, while the fronds are a charming light green—so exquisite that no one can fail to be struck by its beauty. In the same greenhouse I noticed a large number of *Adiantum pellucidum*, which has the peculiarity of being scented. It was growing very freely, although I understand it is somewhat scarce. *Lloyd Evans, Warwick.*

Gloxinias.—I am not in the least surprised at the introduction given concerning these in the *Gardeners' Chronicle*, at p. 798, by Mr. Lloyd Evans. There were many plants of Mr. Alan Bone's "remarkable hundred," which had considerably more blooms than the average number I specified, especially had I considered the flowers which were coming open. During the past week I have inspected the gardens of Sir George Stucley, Bart., at Bideford, and amongst the many beautiful subjects to be found there is an extensive collection of *Gloxinias* which averaged quite

FIG. 5.—DISEASE OF LARCH AND FINE SEEDLING. SEE P. 12.

beginning of May, were killed to the ground, while *L. giganteum*, just opposite them, had the leaves, which were then developed frosted, and looked bad; they have, however, thrown up their flower-spikes, and hardly show where they were damaged. I think it may be taken as a fact from our experience of over a good many years, that *L. cordifolium*, unless planted where evergreens will protect it from sun after spring frosts, requires the protection of Fir bushes or similar shading. I had an instance of the efficacy of light protection in the case of two lots of *Valotia purpurea* planted near the water's edge. Over these we placed common wicker coops with bracken interlaced. Most of the bulbs are all right. A wren made her nest in the Fern of one of the coops, and brought up her young. Even some of the North American Lilies, *pardalinums*, &c., have some shoots frosted, though in some beds these Lilies are untouched. In the narrow field of *L. auratum*, where the protecting cut fence are not high, thus giving but little protection from weather, most of the Lilies seem to have done better than where they had more, though insufficient shelter. For some years past the winters have not been severe enough to try Lilies fairly, but I think last winter may be taken as above an average one as a test. If you care to have them I hope to

fifty flowers per specimen. We have indeed arrived at a high standard of excellence in gardening, and it is gratifying to chronicle such meritorious handwork as this. *W. Waffer.*

THE ORCHID CONFERENCE AT LIVERPOOL.

This gathering, excited much interest among those present. Many of the Council were present, including several growers and many versed in the general principles of nomenclature, and engaged in their application. Sir Trevor Lawrence, the President of the Society, occupied the chair, and cleared the ground by defining the limitations of the subject and the objects to be attained. He regretted the unavoidable absence of Prof. Reichenbach on an occasion of this kind. On resuming his seat, the Chairman called upon Mr. Ridley, of the Botanical Department, British Museum, to introduce the subject of the nomenclature of orchids, which he did in the following terms:—

MR. RIDLEY:—I do not think that there can be any doubt but that the state of the nomenclature of Orchids at the present day leaves much to be desired in the way of simplification. The immense size of the order, numbering upwards of 5000 recorded species, the intricacy of the synonymy and the rapidity with which the number of known species has been increasing during the last few years, accounts for this in great measure. It has been almost impossible for our orchidologists, few as they have been, to arrange or systematise to any extent, the species of any of the larger genera in an accessible form, on account of the very constant and rapid accessions to our knowledge of the species. The result of this is that every year the difficulties increase, and seem likely to do so until some botanist shall arise who will devote himself to the humble but important task of sweeping up the scattered works of past generations, and sorting and arranging them in a simple and easily consultable form.

The whole group of Orchids may be roughly divided into non-cultural and cultural species. By the former I mean plants which, though interesting in themselves, are not considered worthy of culture, and which are, therefore, chiefly known from herbarium specimens. These, as a rule, present no difficulty to a systematist, owing to their smaller amount of synonymy and usually more careful descriptions, as well as to the fact that typical specimens are almost always to be found in one or the other of our great herbaria, which is not always the case in the matter of the showier plants; sometimes however a few of them half accidentally find their way now and again into the houses of our cultivators, often at considerable intervals of time, and, alas! are not unfrequently saluted by a new name, as they are very soon expelled to make room for more showy plants, and are often, especially in the older works, ill described, rarely figured, and not preserved as herbarium specimens. What wonder, then, that errors frequently occur in such cases?

But it is especially with cultural Orchids that we have to deal to-day, and these are burdened with a synonymy that certainly requires lightening. Horticulturists' favourites may be divided into two sections—one in which the species do not vary to any extent under cultivation, so that he who desires novelties must seek for new species; and another group in which one or a few species of a genus are so manipulated and selected, that an endless variety of so-called species is the result. Among the former class, I should include such genera as *Dendrobium* and *Cologyne*. Of these most of the specific names found in garden catalogues really represent more or less distinct species, or at the worst, well-marked varieties. The other section is best represented by the *Cattleyas*. The number of species belonging to this genus is by no means large. Mr. Bentham in the *Genera Plantarum* computes them at about twenty species, and I think he is rather over than under the mark. The names, however, in garden books are simply legion, nearly all of which represent mere forms of *Cattleya labiata*, but which are treated as of equivalent value to genuine species such as *C. citrina*, *C. Forbesii*, &c. Some distinction should be made between these forms and the distinct species, and it could easily be done by giving fancy names to the former, and abolishing their classical names. To show the exceedingly inconvenient results

of naming these forms in Latin a language which is not too well provided with suitable adjectives for plants at the best I may cite the following names from a recent sale catalogue:—*Cattleya Mossie* superba, *C. Mendellii* superba, *C. Triane* superba, *C. Triane rosea* superba, *C. Eldorado* superba; *C. Gaskelliana* superba, all of which are varieties of *C. labiata*, and quite distinct from the well-known species *Cattleya superba*. All cultural forms of this nature then should be treated as *Auriculas*, *Roses* and *Tulips* have been for many years, and designated when requisite by fancy names, in any language but a classical one. The chief species to which this applies are *Cattleya labiata*, *Masdevallia Lindenii*, *Odontoglossum crispum* and *Pescatorei*, *Lycaste Skinneri*, *Cypripedium isogone* and *barbatum*; but there are numerous other species, of which two or three cultural forms have received classical names instead of the more suitable fancy names.

This does not do away with the naming of real varieties, that is with forms of plants which have certain distinguishing characteristics, which remain tolerably constant.

I take as an example of the kind of revision required the names of varieties of *Cologyne cristata* which I find in a recent garden catalogue. They are:—*Cologyne cristata*, *C. c.*, *Chatsworth* variety; *C. c. hololeuca*, *C. c. Lemoiana*, and *C. c. maxima*.

Now of these there is only one objectionable one and that is the last, *C. c. maxima*, for on hunting up the original description I find that its simple characteristics are that it is a little bigger than other forms. Now apart from the fact that the size of the flowers is probably due simply to an extra supply of nourishment, and would most likely diminish in the same plant again under unfavourable conditions, the mere size of the flowers is quite insufficient to distinguish one plant from another, unless there is enough difference to be stated in figures. Thus it might be 10 inches across instead of 3. This plant probably was not worthy of a name at all, but if it was it should have been a fancy name.

The remaining names speak for themselves; and *C. cristata hololeuca* is distinct as a colour variety in the absence of the yellow patch on the lip. *C. c. Lemoiana*, again (though the error made by its original namer in imagining that *Lemoiana* meant lemon-coloured may call up a laugh at his expense), is equally unobjectionable.

In naming a new variety, therefore, the namer should think first whether he can specify in a few words the cause of distinctness in the variety—thus, *Cologyne cristata alba*, lip entirely white. If not, and the difference is really so slight that words will not clearly convey it, as in many, I might also say most of the innumerable varieties of *Cattleya labiata*, the name given should be a fancy name. Professor Michael Foster, in a recent article on *Iris cengialis* in the *Gardeners' Chronicle*, points out that it is not of importance whether a variety of this value first appears in a garden, or in the native haunt of the typical plant; but where one plant varies so slightly from another as not to deserve a [Latin] varietal name, and yet requires some title, it should bear a fancy name. These slight modifications, in fact, are not strictly varieties at all, but forms, and one can, if requisite, break them up still lower, into sub-forms, so that a species may be divided, if necessary, into sub-species, variety, sub-variety, form and sub-form. As an example, *Cattleya labiata* is a species, *C. labiata Triane* a variety, *C. labiata Triane alba*, a sub-variety, and anything lower would be a form. Now it seems to me that it would be most advantageous to give all forms of the plant, from sub-varieties downwards, fancy names.

It is often suggested to make the names of plants in some measure descriptive, but when put into practice this is frequently found to be unworkable. Still the namer of any plant should do his best to make the name expressive of something connected therewith, as for instance the discoverer, or the place of discovery, or the colour. Quintinye, in his *Instructions pour les Jardins*, dated 1697, suggests, in treating of the names of Pinks, that the fancy names should denote the colours of the flowers. Thus he would call a grey and purple kind, the Grand Provincial, or the Grave Philosopher, or General Peter, the initial letter giving the initials of the colours in the flower. The difficulty of such a plan lies in the fact that namers never will conform to anything of the kind.

Another very important necessity is that of regulating the nomenclature of hybrids. They are usually

treated as species, and receive classical names in no way denoting their origin. In wild hybrids this is in a measure excusable, as it is frequently very difficult to discover, on finding a plant intermediate between two species, whether it is a connecting link or a natural hybrid, but in garden hybrids, the parents of which are known, it is much to be deprecated. Certain names, it is true, denote the garden origin of the plants, such as *Cattleya exoniensis* x, and who would doubt that *Cypripedium Sedeni* x was anything but a cultural hybrid. The usual way in scientific works of denoting a hybrid is by compounding the name, as *Carex axillaris-remota*.

This may be shortened by cutting off portions of the two words and making a compacter name, but the only instance I can recall of this method is that of *Philageria*, a name invented by Dr. Masters for a hybrid between the two genera *Lapageria* and *Philecia*. This plan it seems to me should be always adopted in the case of hybrids between two genera. In some cases it would certainly be rather difficult to get a neat name compounded out of the two, but such names as *Cattleya* and *Sophr-cattleya* are not worse than many generic names, such as *Cienkowskia*, *Warszewiczella* &c., with which we have to deal. So confused is the present nomenclature of these generic hybrids that we have known plants of which the parentage is mainly *Cattleya* called *Lælia*, as for instance, *Lælia Dominicana* rosea. This is stated to have been raised from *Cattleya exoniensis* itself crossed with *C. Dowiana*; *C. exoniensis* being a hybrid between *C. Mossie* and *Lælia purpurata*; so that there is actually only quarter blood of *Lælia* in the plant, and yet it is called a *Lælia*.

With respect to hybrids between species, the matter is more difficult, for though compounded names are possible in some cases they are not so in others, owing to the length and unwieldiness of some of the specific names. Where practicable they may be used, but in all cases where it is certain that the plant is a hybrid, a cross (x) should be always put after the name whenever printed. Where the parents produce different forms, a fancy name could be added to the compounded name to distinguish them.

THE DISCUSSION.

Dr. MASTERS, while assenting in the main to Mr. Ridley's observations, took occasion to protest against the idea which is entertained in some quarters, that there is any difference in principle between the nomenclature of Orchids and that of any other family of plants. He considered that the existing confusion depended in great measure upon people not minding their own business. The principles of botanical nomenclature are well known and recognised by botanists, and more or less well acted up to. Botanists, like other people, did not always act fully up to their own principles. Moreover, they made as many mistakes as other people, but there was this difference between the systems employed by botanists and the no-system followed by horticulturists—that botanical mistakes could always be rectified, because the system of publication and registration allowed of easy reference for purposes of future confirmation or correction as might be required, while at present nothing of the kind existed for garden names proper. He cordially acknowledged the right of horticulturists to name their plants as they pleased, subject to the reservation that they should not create confusion by adopting an imitation of the technical language used by botanists. By the unauthorised use of Latin and Greek names, formed on the plan adopted by botanists, and by the want of any authoritative system of publication and registration, growers were in a large measure responsible for the confusion of which they now complained. Dr. Masters pointed out that the Horticultural Society had laid down rules for the guidance of horticulturists, but these rules had been allowed to fall into abeyance, and were more honoured in the breach than in the observance, even by the committees. For public garden purposes the Horticultural Society uses names if possible in English, but in any case so constructed as to prevent any possible inference that the plant had been examined and named by competent botanical authority. The Society should refuse to recognise any botanical name till the plant had been identified by some competent authority. In the same manner he thought that the Committees should decline to adopt any fancy name for plants brought under their notice until the committee were satisfied, on the recommendation of experts that the plant was deserving a separate name and that it was really distinct enough from any existing variation to deserve a special appellation. A register should be kept and published from time to time of all names and if necessary a provisional name given (English), to be replaced ultimately by a permanent name if the provisional name should turn out on examination to be incorrect or inadequate.

Mr. ENOCH HARVEY assented to Dr. Masters' proposals, and urged the Society to institute a committee—some competent persons to form a collection of drawings and dried specimens authoritatively named, and which might be consulted for purposes of reference when needed.

[This plan, it may be said, parenthetically, is followed in our herbaria at Kew and the British Museum, while Professor Reichenbach's unrivalled collection enables him to

supply the requirements of the horticulturists from a purely botanical point of view.]
 Mr. SHIRLEY HIBBERD alluded to the commercial side of the question, and humorously pointed out how Mr. Blank, having an Orchid with a spot in one corner of a petal, gave the plant a name, and forthwith sold it without the least further thought. He received the price of his plant, and there was an end of the matter. For the rest the speaker advocated the "kicking out of the names of all garden varieties."

Mr. GOLDING criticised some of Mr. Ridley's statements, and differed in opinion as to the degree of value to be placed on certain forms of Orchids which he considered of higher rank than Mr. Ridley seemed to do. [Such questions of differences of appreciation of relative rank are unavoidable.] Mr. Golding also objected to the statement that the form of the pseudobulb could be altered by cultivation, as Mr. Ridley appeared to infer in the case of certain species.

Mr. RIDLEY defended his propositions by adducing several instances, in which he was confirmed by Mr. Harvey and Sir Trevor Lawrence. Mr. Ridley also made an appeal to Orchid growers to furnish him with adequate specimens for determination. The specimens would be preserved for reference in the museum.

Sir TREVOR LAWRENCE expressed his willingness to supply specimens both to Professor Reichenbach and Mr. Ridley, and advised his fellow-orchidists to do the same as opportunity allowed. [Speaking for ourselves, we are pleased to acknowledge gratefully the assistance we receive from growers in these particulars.]

Professor MICHAEL FOSTER agreed with many of the observations of Dr. Masters, and urged the desirability as far as possible of making the name in some way or another descriptive, so that the nature or history of the plant might in some degree be embellished in the name. Names for hybrids, he suggested, should be made to end in a consonant; thus, if Dr. Masters' *Philigeria* had been named *Philiger*, its hybrid character (between *Lapageria* and *Philesia*) would have been indicated. Professor Foster also advocated the establishment of a collection of drawings and specimens for reference.

Mr. LYNCH also advocated the formation of such a collection, and the appointment of a horticultural botanist, whose special duty it should be to keep the collection in order, and to take charge of the questions of nomenclature generally. He further suggested that a petition should be forwarded to Professor Reichenbach to draw up a general summary of his life's work!

Sir TREVOR LAWRENCE, in summing up the discussion, alluded to the desirability of botanists affording for the benefit of those not versed in the dead languages an explanation of the meaning of the names they employed.

Thus ended the Conference, which proved a bright and interesting meeting, and in which, from the brief summary we are only able to give, it will be seen that some practical suggestions were thrown out.

Reports of Societies.

ROYAL HORTICULTURAL SOCIETY'S PROVINCIAL SHOW, LIVERPOOL: June 29 to July 5.

WE may with safety endorse the general opinion of that part of the horticultural world which has been enabled to attend this meeting of the Royal Horticultural Society at Liverpool, that the meeting has been a thoroughly successful gathering in the horticultural sense—financially it is yet too premature to prophesy. The weather, which after all tells most for or against these out-of-doors diversions of mankind, is now at the moment all-propitious, and so far influenced the attendance as to bring great numbers of interested visitors on the opening day. We must hope for a continuance of fine weather, and then the financial success should likewise be assured. It speaks volumes of the support given to the old Society that it has found sufficient support from the gardeners and their generous employers, and the municipality of Liverpool, to inaugurate what must be called a "great show."

Flowering plants were in abundance, taking into consideration the lateness of the season for the best things. Crotons were shown in better form; our old acquaintances in foliage plants, which meet us at every big gathering, were in excellent health and vigour. Orchids were an especially good feature, and are evidently plants for which the Liverpool amateurs show a great penchant, and which they cultivate in their not over-salubrious Lancashire atmosphere in an excellent manner, that was a surprise to those who are apt to imagine all that is good is the product of the south parts of the island. Herbaceous plants of all kinds were found in great quantities, as were cut flowers, British Ferns, tuberous Begonias, and annual Pelargoniums. The south country growers contributed well in Roses, and show and fancy Pelargoniums.

The fruit was of fairly good quality for the season, but was on the whole poorly represented. Pines were abundant, and better than we remember seeing them anywhere during the previous season.

Vegetables, shown in small quantities, were excellent.

Tools, garden machines and appliances, boilers, glass erections of most kinds, summer-houses, and the now innumerable articles in daily use in gardens were to be found in great abundance.

The great seed houses made effective displays, although they rather overshadowed the principal exhibition, by the proximity of their ambitious façades and grandiloquent signboards and trade announcements.

FLORAL DIVISION.

Two-ee Stove and Greenhouse Plants, six in flower, distinct (open).—1st, Mr. J. Cypher, Cheltenham, The

FIG. 6.—END ELEVATION OF PEACH WALL CASE. (SEE P. 19.)

FIG. 7.—SECTION OF PEACH WALL CASE.

flowering section comprised *Anthurium Scherzerianum*, a capital specimen, loaded with fine spathes; *Ixora Regia*, a large plant; *Erica tricolor* Wilsoni, well done, and 3 feet in diameter; *Dipladania amabilis*, also finely flowered; *Allamanda Hendersoni*, literally drooping under its burden of bloom. Foliage plants were—*Croton Queen Victoria*; *Lantana borbonica*, a fine symmetrical specimen; *Lantana borbonica*, a fine plant; *Kentia Carterburyana*, and *Cycas revoluta*. This group was the largest in the show, 2d, Mr. J. Mould, Pewsey, with plants of *Erica aristella*, *Bougainvillea glabra* in globular form; *Dipladania amabilis*, *Ixora coccinea* were beautiful plants,

as were also *Gleichenia rupestris* and *Cycas revoluta*; but all were of a much smaller size than the foregoing. 3d, Mr. H. James, Lower Norwood, whose *Pilea maritima*, *Lomaria intermedia*, *Fraxicea calycina* major, were well grown, but showing signs of exhaustion.

One Stove and Greenhouse Plants, in bloom, distinct (ourselves).—1st, Mr. J. Cypher, with *Ixora Filigii*, having enormous trusses of its orange-scarlet flowers thickly set all over it; *Allamanda Hendersoni*, a splendid plant; a large handsome *Anthurium Scherzerianum*, *Pilea decussata*, of 6 feet in diameter, and his variety of *Anthurium Scherzerianum* with deep red spathe and spadix. 2d, Mr. H. James, with *Dracophyllum gracile*, *Statice Helfordi*, *Allamanda nobilis*, *Erica Cavendishi*, being well grown examples; 3d, Mr. J. Mould, in whose collection were two *Statice*, *Butcheri* and *profusa*, with an extraordinary amount of flower on them.

Six Stove and Greenhouse Plants, distinct, in bloom (amateurs).—1st, Mr. A. R. Cox, gr. to H. I. Watts, Esq., Elm Hall, Worcester, who had a superb *Ixora coccinea*, 5 feet in diameter, and 3 feet high; 1. *Dixiana*, 6 feet high, and full of flower; 2. *Regina*, the best and most vigorous young plant in the show; *Allamanda Hendersoni*, very large flowers, of great substance; and *Clerodendron Balfouri*—the whole formed capital examples of cultivation. 2d, Mr. C. Paul, gr. to S. Schloss, Esq., Osborne Villa, Bowdon, whose *Stephanotis floribunda*, *Bougainvillea glabra*, and *Boronia elator*, were well-finished examples.

Twelve Hard-wooded New Holland Plants, in flower (open).—1st, Mr. J. Cypher, with *Aphelexis* in variety; *Darwinia sulphifera*, *Pilea decussata*, and *Dracophyllum gracile*, vigorous plants of no great age, and well bloomed.

Nine Fine-foilage Plants, distinct (open).—1st, Mr. J. Cypher, with *Croton Sunset*, a distinct and bright-leaved variety; *Dasyliodon acrotichum*, a large plant; *Croton Johannis*, fairly well coloured; *Cordyline indivisa*, a very fine example with uncommonly stout foliage; *Lantana borbonica*, *Areca Baueri*, and *Kentia Fosteriana*, both large plants, with healthy foliage. This was an imposing group, filling well the corner of the tent in which it was placed. 2d, Mr. J. Jellicoe, gr. to F. H. Gossage, Camp Hill, Woolton, whose *Pritchardia pacifica*, *Lantana borbonica*, and *Dicksonia antarctica* were very good specimens.

Six Fine-foilage Plants, distinct (amateurs).—1st, Mr. A. R. Cox—the *Croton Queen Victoria*, *Lantana borbonica*, *Calamus ciliaris*, with foliage to the pot; and *Aloesia macrobrachia* being capital examples.

Nine Palms, distinct (open).—1st, Mr. G. Williams, gr. to S. Baerlin, Esq., Oak Dene, Didsbury; in this lot were *Thrinax elegantissima*, *Phoenixium seychellense*, *Kentia Belmoreana*, *Pritchardia pacifica*, *Phoenix rupicola*, *Kentia australis*, *K. canterburyana*, *Cocos Weddelliana*, and *Geonoma Schottiana*, sturdy, healthy plants of considerable size. 2d, Messrs. R. P. Ker, nurserymen, Aigburth, with *Licuala grandis*, *Thrinax elegans*, *Phoenix rupicola*, *Kentia australis*, *Scaevortia elegans*—a number of useful furnishing plants.

Nine Exotic Ferns, distinct (open).—1st, Mr. Rhodes, gr. to Mrs. Hiorfall, Grassendale Priory, Aigburth, the species and varieties consisting of *Adiantum formosum*, *Gymnogramma chrysophylla*, *Davallia Mooriana*—the best of the variety in the show; *Davallia bullata*, *Alsophilla Moorei*, very finely grown, with large perfect fronds; *Dictyogramma variegata*, a distinct looking plant with bold fronds; *Microlepia hirta cristata*, *Dicksonia squarrosa*, *Gleichenia spectabilis*—all of them well grown examples, in fresh condition. 2d, Mr. A. R. Cox: of the *Microlepia hirta cristata*, *Gleichenia dichotoma*, *Goniophlebium subarticulatum*, *Dicksonia antarctica*, were handsome, regularly grown examples.

Six Exotic Ferns, distinct (amateurs).—1st, Mr. C. Paul, with an immense plant of *Gleichenia rupestris*, *G. glaucescens*, as large and good; a *Dicksonia antarctica*, 12 feet in height; *Cybotium regale*, with very large fronds, and wonderfully robust; *Brainea insignis*, a symmetrically grown specimen, the bronzy young growth contrasting well with the old green fronds. 2d, Mr. G. Williams, gr., Oak Dene, Didsbury: *Davallia divaricata* and *Cibotium Schiedei* being superb examples, the others in the group not being of equal merit; 3d, Mr. Thos. Gowen, gr. to J. Cunningham, Esq., Linton Lodge, Moseley Hill: *Adiantum Veitchii*, *Davallia Mooriana*, with pretty lace-like fronds, and *Goniophlebium subarticulatum* and *Gymnogramma chrysophylla* being his best plants.

Fifteen British Ferns, distinct (open).—These were well shown by several gardeners, being plants that find much favour hereabouts. 1st, Mr. Thos. Bolton, Fern Cottage, Warton, Carnforth. The species and kinds shown were *Lastrea Filix-mas*, *L. f. var. flexuosa*, *L. dilatata* grandiceps, *L. mas* var. *ramosissima*, *Polystichum angulare* var. *Paleyensis*, *P. a. var. venusta*, *P. aculeatum* var. *cristata* gracilis, *Athyrium Filix-femina plumosum* var. *Axmusteri*, *A.*

F. l. p. var. *Stansfieldii*, *Trichomanes radicans*, and *Scelopendrium var. crispum*. All of these were of unexceptionable good cultivation, fresh and uninjured by travel. 2d, Messrs. C. Rylands & Co., Bold Lane Nurseries, Ormskirk, with an even lot of excellent specimens; 3d, Messrs. W. & J. Birkenhead, Sale, Manchester—very healthy plants, amongst which we noticed a fine piece of *Osmunda regalis* cristata with perfect foliage.

Six British Ferns, distinct (open).—1st, Mr. Thos. Foster, gr. to John Brancker, Esq., Green Park, Liverpool, whose examples of *Athyrium Filix-femina*, a crested form; A. F. f. plumosum, A. F. f. Fieldingii, with long attenuate fronds; and *Polystichum angulare proflera*, were greatly admired. 2d, Mr. G. Barber, 24, St. Michael's Street, Hurst, who had a fine plant of *Athyrium Filix-femina dissectum*; 3d, Mr. J. Hurst.

Twelve Crotons, distinct (nurserymen).—This was the group in which were the magnificent plants of Messrs. Ker & Co. of the Aighburth Nurseries, the sorts consisting of the following varieties, mostly of Continental origin:—*C. Montfontainensis*, of glowing gold and crimson; *C. mosaicos*, of similar colour, but with a different leaf form; *C. Sinitzianus*, a narrow leaved, pendulous habited variety, yellow and green; *C. Bergmanni*, with broad erect foliage of pale gold and green; *C. Aighburthianus*, a very narrow-leaved variety, and of a pale gold on young exposed foliage at the top of the plant; lower leaves green; and the better known *C. Weismanni*, *C. Evansianus*—the latter with handsome large foliage of crimson and green; *C. Neumannii*, *C. Countess*, and, lastly, *C. interruptus aureus*, a narrow yellow leaf. Better coloured plants can scarcely have been staged before at any show. 2d, Mr. J. Cypher, with plants of much less dimensions and paler tints; Baron Frank Salomon, with a plant of a very new and most striking varieties; 3d, Mr. J. Mould, with nice young stuff under 5 feet in height.

Six Crotons, distinct (amateurs).—1st, Mr. C. F. Finnigan, gr., the Winter Gardens, New Brighton, with large and excellent plants, fairly well coloured, of *C. Queen Victoria*, *C. Baron James de Rothschild*, *C. Evansianus*, *C. Johannis*, *C. Prince of Wales*, and *C. augustifolius*.

Six Dracaenas, distinct (amateurs).—1st, Mr. John Lambert, gr. to Colonel Wingfield, Onslow Hall, Shrewsbury: the plants of a medley, with small and high in colour; 2d, Mr. G. Williams, with smaller specimens of greater substance, and furnished with foliage down to the pot; 3d, Mr. A. R. Cox.

Six Adiantums, distinct (amateurs).—1st, Mr. J. Hurst, whose plants consisted of well known kinds of an even size and perfect shape.

Twelve Bromeliads, distinct (open).—1st, Messrs. P. Ker & Sons, for a number of well developed species, consisting of *Nidularium fulgens*, *N. pictum*, *N. sanderianum*, *N. vicia*, *N. hieronymi*, *Encholirium sandersi*, *Zebrakia spectabilis*, a strong piece, carrying a large spike of white and blue flowers or calyxes; *Pouretia mexicana*, *Massangea musica*, *Katatas Legrellii*, *Tillandsia tessellata*. This collection was unique of its kind, in plants that are less grown than their beauty as regards flower and foliage entitles them to be.

Six Caladiums, distinct (open).—1st, Messrs. J. Laing & Co., Stanstead Park Nurseries, Forest Hill, London, S.E., the plants being of quite extraordinary proportions as regards size of leaf and bulb, the most striking being *Candium*, a pale-leaved sort; and Leopold Robert, with very bright coloration. The others consisted of sorts that have been some years in cultivation. There was in this class only one exhibitor.

Twelve New and Rare Plants sent during 1884, 1885, and 1886 (open).—1st, Messrs. Ker & Sons, for *Adiantum cuneatum deflexum*, with fronds possessing five pinnae, and a habit rather more upright than that of the type; *Davallia foeniculacea*, with lace-like fronds, very graceful; *Gymnogramma gloriosa*; *Croton aighburthensis*; and *Anthurium Veitchii* flore rubro, almost too young a plant to decide on its merits. 2d, Messrs. W. & J. Birkenhead, for *Nephrodium Sangwellii*, a plant with stiffly angulate-shaped fronds, of a light green colour; *N. Bausei*; *Adiantum Collisii*, a Fern of a loose habit, the young fronds with a rusty tinge on them; *A. digitatum*, a variety still taller than the last named, and a habit equally spreading; these *Adiantums* will doubtless improve in appearance when older.

Six pans or pots of Lycopods, distinct (amateurs).—The only prize, a 1st, went to Mr. Thomas Foster, but there was nothing in them which calls for comment.

Six Colomes, distinct (amateurs).—1st, Mr. T. Farr, gr. to C. Colton, Esq., Lulworth House, Biskdale, with plants that were perfect hills of handsome leafage, the lesser known kinds being *Gloire de Rougemont*, *Marquis de Nadiland*, and *Mottisborne*, all of which possessed bright pleasing colours; 2d, Mr. W. Bustard, gr. to J. Lewis, Esq., St. Ann's Road, Liverpool, with a number of flatly trained specimens nicely contrasted in colour.

Six Ericas, distinct, in bloom (open).—1st, Mr. J. F. Mould, with excellent plants of *E. ventricosa grandiflora*, *E. tricolor* Wilsoni, *E. ampullacea obovata*, *E. ferruginea*, *E. depressa*, and *E. Parmentieri*, the two last being very handsome, and all were well grown.

Twenty Roses in 5 inch pots (nurserymen).—1st, Mr. C. Turner, though whose well-bloomed plants carried from six to twelve blooms, the gems of the group being *La France*, *Duchesse de Valombrosa*, *Madame Lichame*, *Madame G. Luize*; the plants were dwarf and well furnished with foliage as well as bloom. 2d, Messrs. Paul & Son, Old Nurseries, Chesham, the plants being sturdy examples, but little behind the winning group.

Group of Show, Decorative, and Fancy Pelargoniums, not more than eighteen plants in 5 inch pots (open).—1st, Mr. C. Turner—lovely plants, full of flower, and remarkable for fine development in such sized pots; 2d, Messrs. C. Rylands & Co., useful plants of furnishing size.

Group of Zonal Pelargoniums, under similar conditions to the foregoing.—1st, Mr. G. Rhodes, gr. of Grassendale Priory, whose plants were neat, and nicely furnished with trusses of bloom; very bright were *Sylvia*, *Beauté du Sarrene*, *Leonidas*, *Le Grand*, and *Le Grandshire* Seedling, a pink nosegay, new. 2d, Messrs. R. Fleming & Son, The Nurseries, Maghull, Liverpool, whose exhibits were fairly well bloomed, considering the restriction as to size of pot. *Nine Show and Fancy Pelargoniums, distinct (open)*.—1st, Mr. C. Turner, with *Gold Mine*, a vivid scarlet, with a white centre; *Invincible*, black and scarlet; *Ritualist*, cerise and crimson; *Mrs. Pottle*, Despot, and others equally good, if less striking to the eye. 2d, Messrs. C. Rylands & Co.; 3d, Mr. E. Bridger.

Six Single flowered Zonal Pelargoniums (open).—1st, Mr. E. Bridger, *The Gardens*, Greenhill, Hutton, with vigorous plants, bearing stout trusses, and plenty of them; a sort show—*Mrs. McKinlay*—is a pleasing shade of rose. 2d, Mr. W. Bustard, gr. St. Ann's Road, Aighburth, whose plants were of a semi-globular form, and nicely bloomed; 3d, Mr. T. Gowen, gr. Linton Lodge.

Six Double flowered Zonal Pelargoniums, distinct (open).—1st, Mr. T. Gowen; 2d, Messrs. Fleming & Sons; 3d, Mr. J. B. Dixon, Ashton House, Preston.

Nine Nepenthes or Sarracenias (open).—1st, Mr. H. James, Lower Newwood, with *N. Courtii*, *N. Mastersiana*, *N. M. nigra*, *N. Rafflesiana*, *N. Hookeri*, with fine reddish foliage; *N. robustum*, *N. Dominiana*, all the plants being fairly well furnished with pitchers. 2d, Mr. C. Paul, with broad and a plant of *S. Fieldisii*, a tall green species.

Nine Ten-leaved Pelargoniums in flower (open).—1st, Messrs. Fleming & Sons, with plants in tall pyramid form, consisting of sorts now commonly grown—*Emily Lemoine* (a semi-double scarlet), and *Abel Carrier* (a soft rose), were the best of these; 2d, Mr. R. Ashcroft, Homspit Lane, West Derby, with smaller plants; 3d, Mr. H. James.

Nine Tuberos Begonias, distinct (open).—1st, Messrs. J. Laing & Co., with small plants of both single and double flowered kinds; *Mrs. Amy Adeock*, a double, with the lower rows of petals of a bright pink, and the centre ones white, suffused white, is a distinct and pretty flower; all of the plants were well flowered, and many of the flowers of over-large proportions to please some critics.

Nine Tuberos Begonias, distinct (open).—1st, Messrs. J. Laing & Co. This group consisted of strong plants nearly 3 feet in height and proportionately broad, of single flowered varieties; 2d, Mr. J. Hurst, Beechwood.

Six Tuberos Begonias (amateurs).—1st, Mr. J. Hurst, small plants of new varieties; 2d, Mr. J. Jellicoe, also newer varieties, but smaller in size; 3d, Mr. W. Bustard, with large handsome plants of the now old-fashioned pendulous form.

Six Gloxinias, distinct (amateurs).—1st, Mr. J. Agnew, gr. to Mrs. Watts, Grassendale Park, Aighburth, with strong plants of erect and pendulous varieties, and possessing capital foliage; 2d, Mr. T. Gowen, with smaller plants and fewer bloom.

Six pans of Achimenes, distinct (amateurs).—1st, Mr. J. Hurst, with large pans of well-flowered sorts; 2d, Mr. T. Gowen.

Collection of twenty-five varieties of annuals, in pots (open).—1st, Messrs. J. Carter & Co., 11 High Holborn, London—a very interesting collection, including *Rhodanthe*, *Phlox*, *Nasturtium*, *Cyananthemum*, *Schizanthus*, *Kaulfussia*, *Candytuft*, &c.

Collection of Pansies or Violas, grown in pots (open).—This competition failed to be much responded to, the best coming from Mr. J. Forbes, Buccleuch Nurseries, Hawick, N.B. The plants were robust and very well flowered, as is only possible at this time of year in the North.

ORCHIDS.

Group of twenty-five Orchids arranged with Palms, Ferns, &c. (open).—1st, Mr. H. Hardy, Esq., Dickering Lodge, Timperley (gr. J. Hill). A very effective group, composed of medium sized plants, the flowers

of which were placed slightly above the surrounding foliage. Palms and Ferns were very nicely worked in amongst them. Among the Orchids were the following, in good condition:—*Dendrobium Dearei*, having five spikes of its pure white flowers; *Cattleya Mossie*, a very large and distinct form; *Lælia purpurata*, *C. gigas Sanderiana*, *Acerides Veitchii*, with three spikes, each having several laterals—the only plant in the show of this rare species; *C. Sanderiana*, a most beautiful variety; *C. Mossie*, with thirty-six flowers; *Odontoglossum vexillarium crispum*, four spikes; *O. cordatum*, ten spikes; *Cattleya Mossie superba*; *C. Mendelii*, with one spike, the sepals and petals being pure white, lip intense rosy-amebist, very sharply cut away at the throat; *Masdevallia Harryana*, fine in colour and of a rosy size; *Saccolabium premorsum*, a spike 18 inches long; *Vanda Denisoniana*, two spikes of its creamy-white flowers; *Cypripedium Lawrenceanum*, &c. The 2d prize was taken by Mr. J. Cypher, nurseryman, Cheltenham, who had a good group, but since several fine Crotons were used amongst the plants, the colour of these detracted somewhat from the otherwise bright effect of the Orchids. Many good plants were in this collection, especially *L. D. infundibulata*, with thirty of its white and orange-scarlet flowers; *C. Mossie*, *Epidendrum vitellinum majus*, one plant with twelve, and another with twenty spikes; *C. Mendelii*, *Cypripedium Stonei* Levigatum, having four excellent spikes and good flowers; *C. Lawrenceanum*, *Acerides Fieldingii*, *Odontoglossum vexillarium*, *O. citrosum*, *O. crispum*, and *O. Pescatorei*; *Oncidium Lanceanum*, a capital spike, 2 feet long, with flowers of good substance and colour; *Angulua eburnea*, &c. 3d prize taken by Mr. H. James, nurseryman, &c. At Mr. Wood's, whose plants were mostly small, yet including nice pieces of *Odontoglossum cordatum arcurum*, *Cattleya Mossie*, *C. Mendelii*, *Odontoglossum crispum*, *Epidendrum vitellinum majus*, &c.

Twelve Exotic Orchids (amateurs).—In this class some excellent plants were shown, the most noticeable, perhaps, being fine healthy and well flowered plants of *Odontoglossum vexillarium*, capital *Cattleya gigas*, *Mossie*, &c. Here Mr. G. Hardy came again to the fore, with plants in every way worthy of the Che-rite establishment. The plants being placed on a sloping bank, with a fair space about it, and could be seen to advantage. *Cattleya Mossie*, with forty flowers of a capital colour, was very telling; *Dendrobium Wardianum*, an immense plant, with fourteen flowering growths full of flowers, was very creditable; how Mr. Hardy had managed to keep this early spring-flowering *Dendrobium* till the end of June was a matter of surprise to many of the Orchid growers present. *Acerides orbiculata*, *Cypripedium Stonei*, six spikes; *Cypripedium Lawrenceanum*, thirty flowers; *Cypripedium Larishii*, eleven spikes of its singular purple and green flowers; *C. gigas Sanderiana*, grand in colour and of immense size, three spikes, eleven flowers; *Dendrobium vastissimum*, eight spikes; *Cattleya Mendelii*, twenty flowers; *Odontoglossum vexillarium*, very deep in colour, full of bloom; *Odontoglossum vexillarium*, a fine plant, 3 feet over, with petals of a bright rose, lip large and very light colour; 2d prize was taken by E. Harvey, Esq., Liverpool (Mr. Worth, gr.), with a capital lot, among which we noticed *Cattleya Leopoldi*, with bulbs 4 feet long; the plant bore three spikes of bloom only, none of which, however, were fully developed; *Phalenopsis speciosa*, a very rare and choice species, in the way of P. Ludde-manniana, but much brighter in colour, the bloom being of a very bright rose colour; *Cattleya Mendelii*, five spikes; *Masdevallia Harryana*, Meadow Bank variety, with fifty flowers; *Odontoglossum citrosum*, three capital spikes; *Lælia purpurata*, one spike; *Cattleya Sanderiana*, *Odontoglossum vexillarium*, ten spikes, deep in colour, but rather small flowers; *Acerides Lindleyanum*, *Epidendrum vitellinum majus*, twelve spikes; *Cattleya Warnerii*, ten good flowers; *Odontoglossum crispum*, five spikes; 3d prize taken by Mr. G. Hardy, Esq., who had a good plant of *Angulua Clowesii*, with seven flowers; *Dendrobium Daihouseanum*, nine spikes of its tawny buff flowers; *Cattleya lobata*, a well flowered plant with five good spikes; *Cattleya Mendelii*, a very nice form, having white sepals and petals pure white faintly margined with rose colour, and a good purple labellum; a *Schönbrounii*, with the growth of thibids, with a spike about 1 foot long with a dozen flowers, the sepals and petals having a pale yellow and a deep purple labellum—a beautiful thing; *Dendrobium Bensoniae*, twelve flowering bulbs; *Acerides Fieldingii*, two capital spikes; *Angulua Ruckeri sanguinea*, eight flowers; *Odontoglossum crispum*, three spikes; and *Cattleya gigas Sanderiana*.

In another collection we noticed a good dark form of *Cattleya gigas*, *Saccolabium pascuorum*, a grand new *Dendrobium tortile* rosette, very well bloomed; *Cattleya Mossie*, *Masdevallia Harryana*, eight flowers; *Cypripedium Veitchii*, twelve flowers; a grand mass of *Dendrobium filiforme*, having thirty-

six spikes of its very pretty flowers; *C. gigas*, a large plant of *Masdevallia bella*, full of bloom; *Odontoglossum caudatum*, &c.

In the corresponding class for nurserymen Mr. J. Cypher, of Cheltenham, staged a very fine lot, and was successful in securing the premier position. Here we noticed *Dendrobium suavisimum*, with twelve spikes of its bright yellow and purple blossoms; a magnificent plant of *Dendrobium Dacrei*, with thirty spikes of flowers; *Anguloa Clowesii*, twelve flowers; *Epidendrum vitellinum majus*, a large mass with fifty spikes; *Odontoglossum vexillarium*, ten spikes, flowers very large; *Aerides Lobbi*, four spikes, each 2 feet in length; *Cattleya Mendelii*, three spikes; a very dark form of *Cattleya Mossie*, *Scaccolabium guttatum*, with six spikes, the flowers being rather loosely set; *D. Jambianum*, with thirty flowers; *Odontoglossum vexillarium*, a nice plant, and *Cyripedium Lawrenceanum*, with twenty flowers. The 2d prize was taken by Mr. H. James, Lower Norwood, with a useful lot. Here we were glad to find capital plants of *Cattleya Mossie*, with fourteen flowers of good size and colour; *Cattleya Mendelii*, with eleven blooms; *Brassia vertucosa major*, with a number of spikes; *Dendrobium suavisimum*, with nine spikes; *Aerides virens Dayanum*, *Laelia Schilleriana*, *Odontoglossum Curadinei*, *Aerides Fieldingii*, with a spike over 2 feet long, bearing one good lateral; a large well bloomed *Odontoglossum vexillarium roseum*, and *Dendrochilum filiforme*, with forty spikes.

Six Exotic Orchids, distinct (amateurs).—Here again Mr. G. Hardy came well to the fore with good specimen plants full of flower, and foliage vigorous and fresh. His plants were *Cattleya Mendelii*, with ten spikes; *C. Mossie*, with fifty flowers; *C. Sandersonii*, five spikes, producing eighteen flowers of a splendid colour; *Odontoglossum vexillarium*, a fine piece 3 feet through, full of bloom; *Dendrobium crassinode Barbierianum*, a plant in a basket, with ten flowering bulbs 18 inches to 2 feet long, and full of its bright flowers; and a *Cyripedium barbatum nigrum*. 2d prize was awarded to E. Harvey, Esq., who had nice plants of *Cattleya Warneri*, *C. Mendelii*, with fourteen blooms; *Dendrobium Dalhousianum*, three spikes; *Laelia Haryana*, Bill's blood var.; *Epidendrum Wallisii*, with pale yellow flowers, spotted with purple, light coloured labellum, spotted also with rosy-purple—not at all an effective plant on an exhibition stage; and *Odontoglossum crispum*, good variety.

Twelve Orchids in flower.—Special prize offered by the Liverpool Horticultural Company (J. Cowan), consisting of a cup, value 25 guineas, and 10 guineas in cash.—The only exhibitor was G. Hardy, Esq., who put up twelve plants of large size, and in tasteful manner; each specimen was a *bona fide* plant, and they were all well bloomed. In the centre of the lot was a *Dendrobium Devonianum* which was elevated, its light bulbs arching over in a natural manner; this plant had fourteen flowering bulbs, several being over 4 feet in length—a beautiful plant, pleasing every body; *Cattleya Mendelii*, with fifteen flowers perfectly fresh; *Cyripedium superbiens* (Veitchii), with twenty beautiful flowers; *Odontoglossum vexillarium*, a very good plant with twenty spikes, each having four to six blooms; *Cattleya Warneri*, with five flowers being deep in colour, and fine form; on one spike we noticed four flowers; *C. Mendelii*, eight spikes; *C. gigas Sandersonii*, splendid in colour, and large in size; *Dendrobium Jambianum*, a superb plant with sixty flowers, a genuine single piece; *Odontoglossum vexillarium*, with thirty spikes; *Cattleya Mossie superba*, with thirty-six spikes; *Cyripedium Stonei*, with three spikes; and a *Brassia Lawrenceana*. Truly one of the best lots ever put on an exhibition stage.

A large plant of *Laelia purpurata* was shown by the Hon. and Rev. T. Boscauan, having grand bulbs and foliage, and producing large flowers of a deep rose, with broad, expanding lip of a deep purple, gradually fading to the edge.

Miscellaneous Plants.—Messrs. F. Sander & Co. staged a good lot of Orchids, about a hundred plants, medium in size, but well bloomed. *Zygopetalum Gautieri*, *Cattleya Mendelii*, and *C. Mossie* in several varieties; good forms of *Odontoglossum crispum*, among them being several deeply-spotted forms; *O. factum*, *Normodes laxatum elatum*, *L. purpurata*, *Laelia elegans Schilleriana*, &c.

A good group was put up by the Liverpool Horticultural Company (J. Cowan, manager), in which we noticed *Cyripedium caudatum*, *Oncidium leucochilum*, the white *Cattleya Eldorado*, *C. citrina*, *C. Acklandii*, *Vanda Roxburghii*, *Scaccolabium procrustum*, *Maxillaria venusta*, *Aerides crassinodum*, *Feisteria pendula*; several *Chysis levis*, &c. This group was nicely worked up with Ferns, and edged with *Adiantum Paccoti*.

In a group staged by Mr. B. S. Williams, Holloway, amongst many other useful and ornamental foliage and flowering plants were to be seen nice plants of *C. Warneri gigas*, *Cyripedium Veitchii*, *C. Mossie*, *Odontoglossum Curadinei superbum*,

Cyripedium ciliolare; *Masdevallia S. Hillmii*. Messrs. J. Backhouse & Sons, York, also staged a group, in which were good *Cattleya gigas* in several distinct forms, *C. Warneri*, *C. Harrisoni*, *C. Leopoldi*, good forms of *Odontoglossum crispum*, and the small and pretty *Oncidium conigerum*. Several pans of *Disa grandiflora*, in bud, were in this collection.

Twelve Cut Flowers of Orchids, varieties distinct (cut spikes or cut flowers, set up with Ferns, &c.), to be shown in glass.—Mr. J. Cypher was 1st, showing nice spikes of *Epidendrum vitellinum majus*, *Dendrobium infundibulum*, *Odontoglossum crispum*, *Cyripedium barbatum*, *C. Warneri*, *C. Mossie*, *Odontoglossum vexillarium*, *Dendrobium eburneum*, *Laelia purpurata*, *Anguloa Kueckeri*, *Cattleya Mendelii*, and *Odontoglossum Schieperianum*. The 2d prize fell to A. Heine, Esq., Fallowfield (gr. J. Craggs), who had good flowering bulbs of *Dendrobium nobile*, *Vanda tricolor cinnamomea*, *Odontoglossum cordatum*, *O. Schieperianum*, *Cattleya Mossie superba*, *C. Mendelii*, *C. Lawrenceana* (a dark form); *Dendrobium formosum*, *Odontoglossum crispum*; *Cyripedium barbatum giganteum*, *Laelia purpurata Nelsonii*, a very dark form. H. Gaskell, Esq., was awarded 3d prize, for good flowers and spikes of *Cattleya Sandersonii*, *Calanthe veratrifolia*, *Laelia purpurata*, *Masdevallia Haryana*, *Cattleya maxima*, *Anguloa eburnea*, *Odontoglossum Curadinei*, *Dendrobium Dalhousianum*, *Epidendrum vitellinum majus*, *Odontoglossum crispum*, and *Vanda leucosticta*.

The Orchids shown were remarkable for their floriferousness and the general freshness of the individual plants. The *Cattleya gigas* varieties were excellent in colour and large in size. Among exhibitors G. Hardy, Esq. showed remarkably well, taking the leading prize in each class, a feat which speaks well for the excellence of his collection as a whole. It is needless to say, that the part of the tent in which the Orchids were staged was crowded as soon as the exhibition was opened, and continued so during the whole of the day.

Group of Miscellaneous Plants, arranged for effect, occupying a space not exceeding 300 square feet (open).—1st, Messrs. K. P. Ker & Son, who had secured the most striking effects by their method of arrangement, and the use of bright coloured Crotons. The ground was hidden by numbers of *A. luteum*, disposed so that the plants barely touched, and amongst these, at intervals sufficiently wide, were placed *Crotons*, *Dracenas*, *Palms*, *Anthurium* in flower, *Lilium Harrisii*, just a few to aid by the contrast of pure white against dark foliage; other plants, disposed in what may be called the temperate section of the group, consisted of *Pelargoniums*, *Roses*, *Rhododendrons*, *Gloxinias*, &c., likewise mixed up with *A. luteum*, 2d, Messrs. W. & J. Birkenhead, whose group consisted of a carpet of *A. luteum*, the Ferns arranged to closely together to produce a pleasing effect. The good material was there, but there was far more than was required for the space at disposal.

A Group extending to not more than 100 square feet (amateurs).—1st, Mr. G. Williams, Oak Dene, whose arrangement consisted of a mound clothed with *Adiantums*, with a bed of the same on the level, flowering plants, *Palms*, *Crotons*, small *Caladiums*, being distributed over it. The central point reached on the top of the mound, the pot being hidden in a careful manner with *P. luteum*, 2d, Mr. A. R. Cox, whose group was arranged on the level, being only broken up by the plants employed, which consisted of white Lilies, *Palms*, *Orchids*, *Gloxinias*, *Francoa ramosa*, &c.; 3d, Mr. J. Jellicoe, whose plants were of better quality, but being small, failed to produce a satisfactory arrangement.

Group of Miscellaneous Plants, in or out of flower (nurserymen).—3d, Mr. Samuel Johnson, of Aston, Birkdale, who was rather to be anticipated, artistically arranged, and was composed of *Crassula coccinea*, *Fuchsias*, *Petunias*, *Ericas*, &c.

Group of fifty Hardy Herbaceous Plants (open).—1st, Messrs. J. Dickson & Son, Newton Nurseries, Chester; this formed a striking feature near the entrance to the great tent, and being composed of strong plants which had been grown for some time in pots, and selected with an eye to effect, compelled admiration; we need a few names, viz., *Campanula rapunculoides*, *C. Burghallii*, with large bluish white bells, a distinct-looking species, and growing as seen 4 feet in height; *Aquilegia chrysantha*, *Mimulus cardinalis*, and *M. e. Earl of Radnor*, both tall, robust plants full of flower, the latter variety having crimson flowers; *Galetia candidans*, *Francoa ramosa*, *Lilium speciosum rubrum*, and other common species very tall and strong; *L. speciosum album* stood 6 feet high, and the others were all covered with flowers; a tall Composite with yellow flowers was seen in *Erythrochate palmatifida*. Mr. J. Bustack, gr. to Enoch Harvey, Esq., 12, Riversdale Road, Aigburth, took the 2d prize. In this group we noted *Inula glandulosa*, *Cyripedium spectabile*, some very floriferous herbaceous *Paeonies*, which appeared to have been growing some years in their pots,

Oenothera Youngii, with pretty yellow flowers, very good form; *Pyrethrum*, *Schell-leimosa*.

Fifty Hardy Alpine or Rock Plants (open).—Here the prize was taken by Messrs. Paul & Son, the Old Nurseries, Cheshunt. There were many good and rare things amongst them, as *Dryas octopetala*, *Erigeron glaucus*, *Phyteuma Chancellii*, *Ranuncula pyrenaica*, *Androsace lanuginosa*, *Gemma sagittalis*, *Campanula turbinata pallida*, *C. rhomboidalis*, *C. tenuifolia alba*, and *C. species*, with lovely blue flowers, that do not droop; *Acantholimon glumaceum* and *Saxifraga coccinea* fasciata. The plants appeared to be well established in their pots, and therefore well adapted for cultivation, not being merely botanical curiosities.

Group of Hardy Ornamental Foliage Trees and Shrubs (nurserymen).—1st, Messrs. J. Dickson & Sons, whose exhibit was very rich in varieties of Japan Maples, that are so well adapted for the cool conservatory in the early part of the year, if too tender to be planted out-of-doors in most parts; Oaks, with variegated and golden-coloured foliage; *Quercus laevis*, *Eucynus*, &c. 2d, Messrs. W. Barron & Sons, Epsom Nurseries, Burghwall, who had larger grown Japan Maples, but not in such variety as Messrs. Dickson. The plants shown by Messrs. Barron were:—*Acer atropurpureum*, *Cornus mascula* var., *Acer polymorphum atropurpureum*, *A. Negundo* var., *Fagus atropurpurea*, *F. o. pendula*, *Ulmus aurea Rosseusii*, *Quercus Cerris* var., *Prunus Pissardi*, *Ulmus myrtilifolia purpurea*, *Esculus aurea* var., *Tilia disticha*, *Acer Fraxino-Piantum Leopoldii*, *Ulmus campestris elegantissimus pendula*, *U. latifolia alba maculata*, *U. montana*, *Dampiera aurea*, *Quercus pedunculata albo-maculata*, *Q. p. atropurpurea*, *Acer polymorphum atropurpureum dissectum*, *A. polymorphum*, *A. p. dissectum*, *A. p. palmatifidum* var., *A. rubinervis*, *A. marmorata*. The above were strong plants in tubs, symmetrical and vigorous of growth, as we are accustomed to see from these nurseries; *Abies Sieboldii*, *Retinospora plumosa aurea*, *Leptodermis reticulata aurea*, *Abies Douglasii glauca*, *Thuopsis Standishii*, *Taxus haccata aurea* var., *Abies Pattoniana*, &c.

Miscellaneous.—Messrs. R. Smith & Co., Worcester, staged a very bright and interesting group, consisting of varieties of *Clematis* in pots, well flowered; also small plants of new varieties, some of which had beautiful flowers, but being as yet unnamed, we can only mention them in a general way; *Ericas* and *Roses* in pots, neat, floriferous plants; Japanese Maples, *Peonies*, as cut flowers; a large bouquet of blooms of *Diarrhena chinensis* was very conspicuous for its bright tints. Messrs. W. Cutbush & Son, nurserymen, Highgate, showed a group of plants consisting of *Ivies* in many varieties, for which the Highgate nurseries are noted, Japanese Maple, *Lilium Harrisii*, *Crassulas*, *Suirazas*, &c., a pretty group of useful plants. New Holland plants, which are largely grown at this nursery, were present in but few examples. Messrs. F. & A. Dickson, Upton Nurseries, Chester, had a circular group near the entrance in the big tent, consisting of *Dracenas*, *Palms*, *Ferns*, &c., small stiff put together lightly. Mr. Jennings, gr. to Leopold de Rothschild Esq., Ascot, Leighton Buzzard, showed a splendid group of *Caranation Souvenir de la Malmaison*; the flowers were of the largest size, and showed well the degree of excellence obtained by him in their culture. Mr. C. Turner showed also the same variety and the pink flowered; *Caranation Lady Rose Molyneux*, a white, and *Prince of Orange*, a yellow with a wire edge. Messrs. Kelway & Sons, Langport, Somerset, had cut blooms of *Gaillardias*, *Pyrethrum candidum*, &c., a pure white of good form. Messrs. Backhouse & Sons, nurserymen, York, received a Gold Medal for a group of plants consisting of *Cattleyas* of various species, *Odontoglossum* and *Oncidium conigerum*. Their collection of *Trichomanes* and *Hydrophyllum* was rich in rare species, of which we need not give the names. *Luschnathium var. pulchra*, *T. micifolium*; *Hymenophyllum tamiscianum*; *H. multiforme*; *H. hiratum*, very rare; *H. chilense*, with capsules borne on the upper surface of the fronds. Many fine plants came from the same nursery. We noticed *Athyrium Filix-foemina Edwardsii*; *Saxifraga Lantascana superba*; *Leptospermum scoparium*, which we are surprised to find flowering so far north in the open air; *Silene petraea*, with the habit of the common Thrift, with heads of small white flowers; *Potentilla nitida* var. atro-rubens, with silvery trifoliate leaves and bright rosy-pink flowers; *Aster alpinus alba*; *Buxus latifolia aurea*, the foliage pale yellow; *Salix lanata*, with a creeping habit and grey foliage, &c.

Messrs. K. E. Laird & Sons, Edinburgh, showed twenty-four varieties of *Hydrangeas* of great excellence. The Liverpool Horticultural Co. (Limited), Mr. John Cowan, manager, exhibited a group of *Roses*, *Paquerette*, *Mignonette*, and *My Pet*, small flowered varieties well adapted for pot culture. Other exhibits from this nursery consisted of very fine double and single *Petunias*, of charming variety in form and colour; *Crotons*, *Palms*, &c.; the group taking up considerable space in the cut-flower tent.

Messrs. Jas. Dickson & Son received a Bronze Banksian Medal for a group of succulents, consisting of Alocs, Agaves, Yuccas, Euphorbias, Mammillarias, &c.

Messrs. James Veitch & Sons, Royal Exotic Nursery, Chelsea, had a most interesting group of rare plants effectively arranged. Philodendron grandifolens, Anthurium Warocqueanum, A. Veitchianum, all with splendid foliage, and forming the background of the group, against which the smaller plants were well shown up. The Protea cynaroides and Exacum macranthum noticed in the *Gardeners' Chronicle* last week were exhibited in the group, and a collection of insectivorous plants, consisting of Cephalotus and Drosasera, small examples, under a bell-glass; Caraguata angustifolia, with a scarlet flower-scape and smooth narrow arching foliage; Aralia Kerchoviana; Nephrolepis rufescens tripinnatifida; Hydrangea paniculata grandiflora, two plants, wonderfully well bloomed; several handsome greenhouse Rhododendrons; Nepenthes Masteriana, with large well coloured pitchers; Dieffenbachia Jenmannii, Dracena norwoodensis, green foliage, striped and edged with creamy-white and pink; Hæmanthus hirsutus, with white corymbs of flowers, produced quite freely.

Mr. B. S. Williams, Victoria Nurseries, Upper Holloway, London, had a very charming group, consisting of Cattleyas in variety; various Odontoglossums, Houelleia odorata, Cypripediums, Lycaste Deppeii, Lælia purpurata, Oncidium Papilio, Hydrangea paniculata grandiflora, intermixed with Adiantums, Crotons, small Palms, Spirea palmata, Metrosideros floribunda alba, Sarcocolla, &c. Messrs. Sutton & Sons, Reading, displayed a very large quantity of wax models of toots, fruits, and vegetables; sixty sorts of Potatos of 1885, well preserved; some fine kinds of Cabbage Lettuces of this year's sowing, several Melons and Cucumbers raised at their establishment, together with samples of living grasses and Clovers.

Messrs. Sheel & Son, Lowfield Nurseries, Crawley, Sussex, showed their system of espalier training of fruit trees in various ways. A Gold Medal was awarded.

FLORAL COMMITTEE.

At the meeting of the Floral Committee, James O'Brien, Esq., in the chair; Major Lendy, Mr. Shirley Hibberd, Mr. Herbst, and Mr. Dean, &c., present, First-class Certificates were awarded—

To Messrs. James Veitch & Son, for *Pteris tremula foliosa*, a stately new Fern, with effectively crimped foliage; *Philodendron grandifolens*, quite a show plant, with very long bronzy leaf blades; *Nephrolepis rufescens tripinnatifida*, lovely and curiously overlapping in the pinnae; *Gymnogramma schizophylla gloriosa*, much more robust than the type; *Rhododendron Aurora*, with fine yellow and orange flowers—a greenhouse kind. The award of a Botanical Certificate to *Protea cynaroides*, provisionally given at the last meeting, was confirmed.

To Mr. B. S. Williams, of Holloway, for *Aracæa excelsa Vervæetiana*, a noble plant of the robusta or glaucous type, but with a bright green tint.

To Messrs. R. H. & Co., of Aigburth, for *Croton albibracteis*, a pretty plant, with narrow leaves, almost wholly golden; *Croton Newmanii*, with broad leaves, brilliantly tinted with scarlet, yellow, and bronze; *Gymnogramma schizophylla gloriosa*, as Messrs. Veitch.

To Messrs. James Veitch & Sons, York, for *Hyacinthophyllum picturatum*, which has curiously recurring pinnae; *Trichomanes meifolium*, something like a *Todea pelucida*; *Polypodium vulgare trichomanoides*, an elegantly divided Fern, almost like a filmy Fern; *Asplenium matricum plussum*, which has the pinnae again deeply divided; *Chrysanthemum leucanthemum var. Puy de Dome*, the largest of the hardy white Marguerites.

To Messrs. W. & J. Birkenhead, Sale, for *Nephradium Sangwellii*, a pretty light green Fern, with narrow toothed pinnae; *Lastræa montana coronans*, one of the neatest of crested Ferns.

To Messrs. Kelway & Son, Langport, for *Gaillardia Ormonde*, a large crimson and yellow kind; *Pyrethrum Lawtonburgh*, a grand pure white, quilled double.

CUT FLOWERS.

Seventy-two Roses, distinct (open).—1st, The Cranston Nursery and Seed Co., Worcester. The stands of these were of the usual fine quality of Roses from this nursery, and amongst those of exceeding merit we noticed *Mad. T. Levet*, *Marquise Castillane*, *Marguerite de St. Amant*, *Dingee Conard*, *Vicomte Vigier*, *Magna Charta*, *Baron Haussmann*, *Captain Christy*, *Lady M. Fitzwilliam*, *Mad. Ducher*, *Earl of Pembroke*, *Charles Lefebvre*, *Engene Verdier*, *Constantine*, *Trepanier*, *Mlle. Marie Contet*. 2d, Mr. G. Campbell, Gay Street, Bath, with flowers but little less fine, *Rosieriet Jacob*, *Richard Laxton*, *Ulrich Brunner*, *Alfred Colombe*, and *Merveille de Lyon* being capital examples. 3d, Messrs. Paul & Son, Old Nursery, Cheshunt. Seven lots were staged for this contest.

Forty-eight Roses, distinct (nurserymen).—1st, The Cranston Nursery and Seed Co., Countess of Oxford, *Violette Bowyer*, *Nardy Frères*, *Alons. Notman*, *Julia Touvais*, and *Ferdinand Chaffotte* being some of

the finest, together with the sorts mentioned as being prominent in the previous competition; 2d, Messrs. Paul & Son, Cheshunt; 3d, Mr. J. House.

Twenty-four Roses, distinct (nurserymen).—1st, Mr. Prince, Oxford, the Roses in his boxes bearing the usual evidence of the suitability of his soil of the district for the production of a great substance of petal and leaf and size of flower. Very good were the sorts *Catherine Mermet*, *Princess of Wales*, *La Boule d'Or*, *Jean Ducher*, *Madame Kuster*, *Rubens*, and *Souvenir d'Elise Varden*, *Souvenir d'un Ami*; but so good were the majority of the flowers that it is invidious to make a choice. Equal 2d, Messrs. Cooling & Sons, Bath, and the Cranston Nursery and Seed Company.

Twenty-four Tea Roses, distinct (nurserymen).—No 1st was awarded. 2d, Messrs. G. Cooling—a fine lot, but rather small.

Twenty-four Roses, distinct (amateurs).—1st, Mr. G. Campbell, gr. to S. P. Budd, Esq., 8, Clay Street, Bath. In this group were superior blooms of *Niphotos*, *Duchess of Valombrosa*, *Lady Mary Fitzwilliam*, *Countess of Oxford*, *Françoise Michelon*, *Arthur Dickson*, *Rubens*, *Beauty of Waltham*, and *Merveille de Lyon*; 2d, R. E. West, Esq., Reigate, Surrey, the best blooms being found in *Marie Baumann*, *Merveille de Lyon*, *Ulrich Brunner*, and E. Y. Teas.

Twelve Roses, distinct (amateurs).—1st, Mr. E. Claxton, The Rose-tree, Allerton, who had fine *Innocent Pirola*, *Anna Olivier*, *Madame Cusin Niphotos*, *Hon. E. Giffard*, and *Souvenir d'un Ami*; 2d, Mr. S. P. Budd—*Violette Bowyer*, *Alfred Colombe*, *Lady M. Fitzwilliam*, and A. K. Williams being some of his best examples.

Twelve Tea Roses, distinct (amateurs).—1st, Mr. E. Claxton, who had beautiful blooms of *Marie Van Houtte*, *Niphotos*, *Princess of Wales*, *Madame Cusine*, and *Anna Olivier*; 2d, Mr. S. P. Budd, the sorts *Doronicus*, and *Madam Willermoz*, being very fine. 3d, Mr. Marshall Bulley, Chapel Street, Liverpool.

Twelve bunches of Pelargoniums (open).—In this competition the 1st prize was awarded to Mr. C. Turner, and the 2d to Messrs. C. Rylance & Co.

Twelve bunches of Single-flowered Pelargoniums.—The three prizes were awarded to Messrs. Rylance & Co., Mr. Weir, and Messrs. Fleming & Son, in the order of their names.

Twelve bunches Double-flowered Zonal Pelargoniums.—2d and 3d prizes were awarded to Mr. W. Weir and Messrs. Fleming & Son, in the order named.

Twelve bunches Stove and Greenhouse Plants, distinct (amateurs).—The best prize fell to the lot of Mr. G. Williams, who had *Sobralia macrantha*, *Lapageria*, red and white; *Dipladenia Brearleyana*, *Anthurium*, and *Allamanda*. The others call for no comment.

Twelve bunches Hardy Herbageous Plants (amateurs).—Mr. G. Eaton, gr. to W. H. Shirley, Esq., Allerton House, Allerton, who had the best collection, took the premier prize, and Mr. Bustard, the 2d.

Group of Cut Hardy Flowers (nurserymen).—1st, Messrs. R. B. Laird & Sons, West Coates Nursery, Edinburgh; 2d, Messrs. J. Cocker & Sons, seedsmen, Aberdeen, who had an excellent lot of fresh looking flowers, the *Pyrethrum* being larger than we are accustomed to observe in England.

Sixty blooms of Pansies, not more than two of a sort (open).—Here the best prize went to Messrs. J. Cocker & Sons, for a quantity of large flowers, with well-defined colouring, smooth and globular in form.

Twelve varieties of Gloxinia (open).—Mr. Thomas Gowen was the winner here; but the flowers lacked the best marks of the newest strains.

Cut blooms.—Messrs. Dickson & Sons, received the Silver-gilt Banksian Medal for a large quantity of cut flowers of hardy plants shown in grand style, the Peonies, Delphiniums, and Lilies being extremely fine.

BOUQUETS, ETC.

Three Stands or Vases for dinner-table decoration (open).—1st, Mr. J. Cypher, with three tall glasses elegantly arranged with small flowers, grasses, &c., that would look pretty by artificial light, and not intercept the view over the table; 2d, Mr. T. Prewett, Swiss Nursery, Hammer-smith.

Bridal Bouquets (open).—Mr. J. Cypher was placed deservedly in the 1st place for these.

Bouquet for the Hand (open).—1st, Mr. E. Carr, Market Hall, Southampton—two very artistically-made bouquets, not over-crowded with flowers.

Arranged Sprays for Ladies' wear (open).—In this class we noted a yellow *Caration*, *Pride of Penshurst*, which, although somewhat wilted, with the heat, seems to afford excellent material for these articles of fashionable use, the colour being also of the patronised tint of yellow.

Skeletonised leaves and flowers were shown in charming variety by Mrs. Margaret Hodgkins and Mr. R. Frisby.

FRUIT.

The productions shown, if very numerous in most

of the classes, were not of very high order of merit. Pines were of fairly good appearance, no overgrown crowns being observed. Grapes were below the usual quality—Foster's Seedling being small berry; Muscats, however, some of the finest varieties being Hamburgs and Madresfield Court.

For collections of eight kinds: 1st, Mr. R. Parker, gr. to J. Corbett, Esq., Impney Hall, Droitwich, who had well matured Black Hamburgh and Foster's Seedling Grapes, small of bunch, an excellent Queen Pine, well coloured British Queen Strawberries, Noblesse Peaches, Pitmason Nectarines, neither very large; a good Blenheim Orange Melon, and Brown Turkey Figs—a good collection of very presentable fruits. 2d, Mr. G. H. Richards, gr. to the Earl of Normanton, Somerley, Kingwood, whose Black Hamburgh Grapes were rather loose in bunch, but well coloured; Trebbiano, thoroughly ripened; a large Queen Pine, excellent Sir Joseph Paxton Strawberries, Hero of Lockinge Melon, Lord Napier Nectarines, and Alexander Peach, 3d, Mr. Banerman, Blithfield, Figs—very large well coloured Royal George Peaches and Golden Champion Grapes, rather under ripe, were the best items.

Collections of six kinds.—In this competition there was some capital fruit shown by Mr. Iggulden, gr. to the Earl of Cork, Marston House, Frome—Long-leafed Perfection Melon, Hale's Early Peaches, Violet Hâtive Nectarine, Brown Turkey Figs, Elton Cherries, and President Strawberries; 2d, Mr. Miller, gr. to W. H. Long, Esq., Rod Ashton Park, Wilts. In this collection were the handsome Melon hybrid Melon, Hale's Best, and Elton Cherries of much excellence; 3d, Mr. Goodacre, gr. to the Earl of Harrington, Elvaston Castle, Derby, whose fruit ran the previously named lot very closely. An extra prize was awarded for fruit in this class.

Grapes, three bunches of each.—Of these there were eight lots shown, and none of the bunches were very large, and many had been too severely thinned. 1st, Mr. T. Lambert, gr. to Lord Harlech, Oswestry; 2d, Mr. P'Anson, gr. to W. Bretton, Esq., Runham Hall, Norfolk; 3d, Mr. Chobley, whose bunches, somewhat crowded. 3d, Mr. E. Gillman, gr. to the Earl of Shrewsbury, Ingestre Hall, Staffs.—the berries small but jetty black. Mr. Loudon, gr. to T. Barnes, Esq., The Quinta, Chirk, had very excellent fruit, that was, perhaps, inadvertently passed over.

Madresfield Court was shown by Mr. Loudon, and was the only exhibit in its class.

Muscat of Alexandria.—These were the reverse of good, and the winning bunches were small, and not large. Mr. Middleton, gr. to R. Pilkington, Esq., Rainford Hall, St. Helens, took the 1st prize; Mr. McKellar, gr. to J. Watts, Esq., Abney Hall, Chester, the 2d; Mr. Loudon 3d, with the best-ripened bunches.

Foster's Seedling was shown by six competitors, Mr. G. T. Miles being 1st with well-ripened fruit; 2d, Mr. P'Anson.

Any other variety.—Mr. Loudon took the 1st prize with Golden Champion, the bunches being large and green; 2d, Mr. Chuck, gr. to P. Thelluson, Esq., Brodsworth Hall, Doncaster, with small bunches of Duke of Buccleuch, also unripe.

Baskets of Grapes.—1st, Mr. P'Anson, with Black Hamburgs; 2d, Mr. Tugwood, gr. to J. G. Morris, Esq., Allerton Priory; 3d, Mr. Elsworth, gr. to A. R. Gladstone, Esq., Court Hey—the fruit very much robbed of its bloom.

Pine-apples, two fruits.—Mr. G. T. Miles, took 1st prize for Queens; Mr. Parker, 2d, with the same kind; and Mr. Morris, gr. to A. P. Vivian, Esq., Clefdon, South Wales, with fine examples scarcely inferior to the second pair.

Single Pine apple.—Here Mr. Miles was 1st, and in the any variety class, Mrs. Horsfall, Aigburth, was 1st with the only fruit shown, a small Black Jamaica.

Peaches, two dishes of six fruits each.—1st, Mr. Divers, 2d, Mr. Goodacre, 3d, Mr. J. Stoney, gr. to Sir Thomas Earl, Bart., Allerton Towers.

Single dish of Peaches.—Mr. Walters, gr. Keble Hall, was 1st; Mr. Gilman, 2d; Mr. Stoney, 3d.

Nectarines, two dishes.—Mr. Jamieson, gr. to Earl Crawford and Balcarres, Hagh Hall, 1st; and Mr. Banerman, Wigan, was 2d; Mr. Gilman, 3d.

Single dish of Nectarines.—1st, Mr. Jamieson; 2d, Mr. Gilman; 3d, Mr. J. Douglas, gr. to F. Willbourne, Esq., Great Gearies, Ilford. Varieties of Peaches shown were—Early Albert, Stirling, Royal George, Grosse Mignonne, Galande, and Violet Hâtive; and of Nectarines—Lord Napier, Fine-apple, Violet Hâtive and Downton.

Strawberries, three dishes.—These fruits were large and well coloured, especially Marguerite, President, Sir J. Paxton. Mr. Garraway, Bath, was winner of the 1st prize with the above sorts; Mr. Iggulden, 2d, with fruit rather smaller.

For a single dish of Strawberries, Mr. W. Wildsmith took the 1st prize with a very fine dish of President; and Mr. G. Garraway 2d, with Sir J. Paxton.

Cherries two dishes.—These fruits were not seen in

great quantity, but were very well ripened. Mr. Hare, Esq., gr. to H. H. C. Neville, Grantham, was 1st, with Eton and Black Circassian; and Mr. Miles was 2d. In the single dishes the same exhibitors took the prizes in similar order, and Mr. G. H. Richards 3d prize.

Figs.—Mr. Wallis 1st, for a dish of Brown Turkey, well ripened and large; Mr. Jamieson 2d, with Lee's Prolific; and Mr. Miles 3d, with Negro Largo, so that the three best varieties of Figs were represented in the winning dishes.

Melons.—Of these there were fifteen couples; Mr. Bailey, Frome, Somerset, 1st, for Longleaf Perfection, a sort like Easton Crack in appearance; 2d, Mr. Gilman, with a sort unnamed.

In Messrs. Sutton's competition Mr. Goodacre was the winner of the 1st prize, with Hero of Lockinge; Mr. N. E. Owen was 2d, and Mr. Iggulden 3d, with the same; Mr. Lockie, gr., Oakley Court, Windsor; Mr. Lyon, gr., Rockferry; and Mr. G. Park, gr. to Col. Parington, Wigan, taking the prizes in the order of their names for Melon Bleinheim Orange.

Apples in excellent condition came from Messrs. Child & Sons, Gray's, Sussex. Twenty sorts were shown, French Crab, Gloria Mundi, and Norfolk Beefing being the soundest fruit.

Messrs. Thomas Rivers & Sons had a very vigorous and clean lot of fruit trees in pots bearing heavy crops, many of them in a ripening condition. Especially noticeable were the Cherries, Oranges, Lemons, Nectarines, and Peaches. Small pyramids in pots were also shown with several fruits on each. They were awarded a medal.

VEGETABLES.

We did not think these were so good as they might have been, many of the samples shown being small; and the entries were by no means so numerous as the encouragement offered warranted us in expecting.

Collection of eight kinds, distinct.—1st, Mr. G. T. Miles, gr. Wycombe Abbey; in this the Veitch's Early Cauliflowers, White Elephant Onions, Canadian Wonder Beans, Pride of the Market Peas, were good, especially the first named. 2d, Mr. Richards, Somerley, this contained good things, the weak points being the Cauliflowers and Potatos. Mr. A. Miller and Mr. G. Garraway, were placed equal 3d, so that four out of the five collections shown received prizes.

Potatos, three dishes.—1st, Mr. F. Miller, gr. to J. Friend, Esq., Margate, Kent; 2d, Mr. G. T. Miles; 3d, Mr. Richards. The sorts shown were First and Best, Pride of the Market, Royal Ashleaf, Snowdrop, Porter's Excelsior, and Sutton's Ringleader.

Single dish of Potatos.—Mr. Goodacre was 1st, with a capital one of Ashleaf Kidney; 2d, Mr. Miles; 3d, Mr. Oldfield, gr., Chirk Castle, Ruabon. Beauty of Hebron and Snowdrop being shown by the last-named competitor.

Peas, three varieties, fifty pots of each.—The Peas were not well filled, for which the ungenial weather experienced little quite recently is responsible. In this class Mr. H. W. Ward, gr. to Earl Rudnor, Longford Castle, was 1st; Mr. Iggulden 2d, Mr. Miles 3d.

Peas, single dish.—Mr. Miles was 1st, Mr. H. Richards 2d, and Mr. Downham 3d. The sorts shown were—Telephone, William I., Telegraph, and Pride of the Market.

Tauchoe Onions.—Of these, three dishes were shown, Mr. Miles being 1st, with White Elephant; Mr. Richards 2d, and Mr. J. Garland, Exeter, 3d.

Cabbages, three heads.—These were not over large, but seemed to be of good quality; 1st, Mr. T. Wilkins; 3d, Mr. J. Garland.

Cauliflowers, three heads.—The examples of these were neither very good nor numerous. The prizes fell to Mr. Wilkins, Mr. J. Burnett, The Deepdene, Dorking; and to Mr. W. Iggulden.

Tomatos, twelve fruits.—The display of these favourites was a good one, and added much to the interest of this tent; 1st, Mr. Elsworth, with Trophy; 2d, Mr. Bridge, with the same kind; 3d, Mr. Long, Rockferry, with Dedham Favourite—a fine lot, apparently misplaced.

Cucumbers one brace.—Many of these in great variety were shown by Mr. N. E. Owen, with All the Year Round, Mr. Oldfield 2d, and Mr. Leigh 3d, both with Telegraph.

MESSRS. SUTTON AND SONS' PRIZES.

These gentlemen offer liberal prizes for the best collections of twelve kinds of vegetables, and the competition for these was very spirited.

Mr. Miles took the 1st prize, with a superior lot of Cauliflowers, Kidney Beans, Tomatos, Marrows, Peas, Turnips, &c.; Mr. J. Garland was 2d, Mr. Miller 3d, Mr. Iggulden 4th, Mr. Lambert 5th, and Mr. Wickens, Blandford 6th. Mr. Richards, Somerley, got disqualified by reason of his showing two dishes of Potatos, but really deserved a prize for the excellence of his productions.

IMPLEMENT EXHIBITION.

Modes of heating a small conservatory from 10—20 feet long. The Silver Medal of the Society was

awarded to Messrs. R. Halliday & Co., Middleton, Manchester; and the Bronze Medal to Messrs. Messenger & Co., Loughborough.

First-class Certificates were given in this competition to Mr. Sam Deards, Harlow; and to Mr. J. Watson, St. Alban's, for a mode of heating with gas, modes of fixing hot-water piping, valves, &c.

The Silver Medal was granted to Messrs. Foster & Pearson, Beeston, Notts, for a collection of valves, new pipe joints, &c.; and a Bronze Medal to Messrs. Messenger for piping and valves, flanges, &c.; plant-house, or viney, or orchard-house.

Messrs. Foster & Pearson secured the Silver Medal for a plant-house; a Silver Medal was awarded to Messrs. Richardson & Co., Darlington, for a forcing-house; and to Messrs. K. Halliday & Co., Middleton, Manchester, for sprays and jets to houses; Messrs. A. Peel & Sons, Wood Green, London, received the Bronze Medal for a plant-house (portable); the same award was made to Messrs. Winch & Sons, Ipswich.

A Bronze Medal was awarded to Messrs. Lowe & Sons, Chester Road, Manchester, for greenhouses, vineries, &c.; and they were Commended for a portable house with boiler and house complete.

Messrs. Stewart & Jack received a Bronze Medal and they were Commended for a cheap small house (portable).

Movable Pitts and Frames.—Mr. John Webster, Prince Alfred Road, Watteyre, obtained a Silver Medal for an improved garden frame; Messrs. Foster & Pearson a similar award for a movable plant-house; and Messrs. J. Crespin & Sons, 58, Milk Street, Bristol, a Bronze Medal for a portable frame, and for a propagating case.

Improvements in Glazing.—There were many specimens shown of these desiderata, Messrs. J. Crespin & Sons being awarded the Bronze Medal for Hunt's Patent Automatic Ventilator; Mr. S. Deards, the Silver Medal for the patent "Victoria" dry glazing.

Hand Mowers.—The Silver Medal was awarded to Messrs. Chadborn & Coldwell, Manufacturing Company, 223, Upper Thames Street, London, E.C. (Mr. Thos. Clarke, manager), for Excelsior Hand-power Mower. The machine is provided with a seat for the driver, and shafts or traces can be a tached.

The New Model, a hand machine, has exceedingly light cutting, cuts grass of any height, and does not rip, besides having other advantages for garden use. Messrs. Barford & Perkins received the Silver Medal for the Godiva Mower, for evenness of work.

Garden Cutlery.—A Bronze Medal was awarded to Messrs. Glassy & Co., 54, Victoria Street, Liverpool, for implements used in the garden.

Garden Pottery.—Mr. John Matthews received the Silver Medal for his deservedly much appreciated pots, vases, &c., and Mr. J. Crute, 14, Knight-bridge, London, E.C., for concave-bottomed pottery, rustic work in clay window boxes, tiles, &c.

The Bronze Medal was awarded to Messrs. Glassy & Co., for garden tools; and to lifting machinery, by Mr. F. T. Drummond, Colon Hall, Bridgnorth, was commended. Messrs. Leedham & Heaton, Leeds, obtained a Bronze Medal for tools; and Dr. H. Sweete, Worcester was Commended for a patent haddy bedding and potting barrow.

Wires.—A Bronze Medal was awarded to Messrs. W. H. Peake & Sons, for training arches; and a Silver Medal to Mr. J. Braham, 104, Dale Street, Liverpool, for a varied lot of wirework. A Bronze Medal was awarded to Messrs. Brooks & Co., 4, Cateaton Street, Manchester, for wire rosey, arches, &c.

Garden Seats, Chairs.—Silver Medals to Mr. H. Caesar, and a Bronze Medal to Messrs. Wrench & Sons.

A Silver Medal was awarded to Messrs. J. Davis & Co., 6, Kennington Park Road, London, for meteorological exhibits of a varied kind.

Garden Engines.—Messrs. Barford & Perkins received a Bronze Medal for patent water ballast garden rollers.

Decorations for Conservatories.—Messrs. Halliday & Co., a Bronze Medal for flooring tiles.

Garden Tents, Chairs.—Mr. J. Unite, 291, 293, Edgewater Road, London, obtained a Silver Medal for these articles, of which a large assortment was observed. Commended were Messrs. W. Richardson & Co., Darlington, for their Parisian greenhouse blinds, made of wood and zinc only. Mr. J. Pinches, 27, Oxendon Street, London, was Commended for a series of useful garden labels of metal.

Other objects not included in the above classes were Treble-wood tubs and Orchid baskets by Mr. P. E. Harkin, 22, Dutton Street, Liverpool, who was Commended. Mr. E. Sydney, who showed parcel post flower and fruit boxes, was also Commended; Mr. G. Frieland, for a new insecticide; Messrs. W. Richardson & Co., for glazed wall protectors; Mr. G. Bloxham, gr., Brickhill Manor, Eblechley, for a fumigator of simple construction, which has the property of sending forth the smoke in a cool state; Messrs. Bennett Bros., Liverpool, obtained a Bronze Medal for sundry wirework, garden seats, &c.; and Messrs. Blake & Mackenzie, School Lane,

Liverpool, were Commended for postal flower and plant boxes and general horticultural printing and seedsmen's stationery.

"GARDENERS' CHRONICLE" PRIZES.

After the luncheon on Wednesday, the Fellows repaired to the Conference tent, when the President, Sir Trevor Lawrence, proceeded to announce the awards of the prizes to young gardeners, offered by the conductors of this journal. Sir Trevor preface his remarks by a statement of the objects of the prizes and the way in which they were to be conducted. As these matters have been often alluded to in previous numbers, we need not occupy space with their repetition. Sir Trevor expressed his entire concurrence with the objects of the donors, and called up Mr. Harry Bunyard of Chiswick, to receive the second prize, the other laureates not being present. Mr. Bunyard's appearance was made the signal for a burst of applause, the greatest interest being felt in the fact that the second prize had been awarded to a Chiswick gardener for a very good and very well illustrated paper. Three cheers were called for for Mr. Bunyard, three more for Chiswick, followed, on the proposition of Mr. Shibly Hibberd of the *Gardeners' Magazine*, by a cheer for the *Gardeners' Chronicle*.

The President then called on Professor Tynaert, of the Ghent School of Horticulture, to make some observations.

M. TYNÆRT, speaking in French, acknowledged the cordial welcome he and the foreign visitors had received, expressed his satisfaction at being invited to take part in such a *file d'intelligence*, alluded, in terms our modesty forbids us from reproducing, the spirit of progress and enterprise manifested on all occasions by the *Gardeners' Chronicle*, and especially on this occasion; and then proceeded to give some details as to the two schools of horticulture in Belgium—that of Ghent, where the cultivation of stove plants and the principles of horticultural science are attended to, and that of Vilvorde, where, concurrently with instruction in horticultural science, pomology was specially studied.

[Visitors to the Health Exhibition at Kensington will not soon forget the magnificent model of the establishment at Vilvorde, and the details illustrative of the scheme of instruction followed at the two Belgian schools.]

Prof. Tynaert incidentally alluded to the value of such schools by pointing to a plan of a landscape garden exhibited on the present occasion by Mr. A. G. Jackman of Woking, a former pupil of the Ghent school. This plan, we may add, secured a prize on this occasion, and will shortly be illustrated in these columns.

M. Joly, of Paris, in an interesting speech delivered in fluent English, said he had made a special study of the means of horticultural education in various countries, and stated that, although we had no schools as on the Continent, nowhere were plants better cultivated than in this country. He alluded to the vast importance of a knowledge of economic entomology, and described the system followed in the United States, where each State had its entomologist, the whole being in relation to a central department in Washington presided over by Professor Riley. He pointed out the enormous advantages thus conferred on practical horticulturists and agriculturists. M. Joly then alluded, in terms of warmest admiration to the multitude of well organised and well equipped schools of horticulture and agriculture in Germany, and attributed the great strides Germany was making in all departments, scientific, practical, and commercial, to the general distribution over the whole country of schools of science of such excellence. If other countries were not to be *abimé* in these matters they must put themselves on a level with the far more advanced systems of scientific education followed in Germany.

Dr. MASTERS asked to be allowed to express his satisfaction at the result of the examinations, and to tender his thanks to the President for awarding the prizes, and to the Fellows present for their sympathy with the objects of the meeting, making a special allusion to his sense of the sympathy and encouragement accorded to him by the presence of his fellow journalists. Dr. Masters further alluded to the vital necessity for gardeners to make themselves acquainted with the working of the machinery they were called on to direct and control, and alluded to the backward state of knowledge in physiological matters among many gardeners, and to the obsolete prevalence among them of fallacies and errors as to root-structure and action, fallacies which had been exploded long ago. He alluded in particular to the wonderful organisation and properties of the tips of the roots as made known by Darwin, and echoed his words as to the existence in that situation of a controlling force and sensibility to impressions comparable in a degree only to the brain of animals. He warmly urged the necessity for further knowledge of physiology as a guide

to cultivators, in the absence of which they would be utterly unable to adapt themselves to the new conditions and new circumstances of the times, and would, as Mr. Joly said, be left behind in the race by nations more advanced in the pursuit of knowledge and its application to practical purposes.

Dr. MASTERS then proposed a vote of thanks to the exhibitors and judges, pointing out the debt of gratitude due to them for their ample fulfilment of what was a vital condition of success on such occasions.

Mr. HARRY VEITCH, in responding, pointed out that he was only one among many, and alluded in graceful terms to the Liverpool exhibitors and those from elsewhere.

Mr. BURRIDGE also acknowledged the compliment, and stated how their labours had been encouraged by the excellence of the exhibits, and facilitated by the efforts of the staff.

Professor MICHAEL FOSTER proposed a special vote of thanks to the horticulturists and exhibitors of Liverpool, and alluded to their strenuous and eminently successful efforts to promote the success of the show.

Mr. HARVEY, in responding, spoke of the pleasure his townsmen felt in receiving the Royal Horticultural Society, but expressed some regret that a larger number of exhibitors from the South had not put in an appearance to confirm the verdict which he and others who visited the southern shows had reported to their fellow townsmen. Mr. Harvey gave an interesting summary of the history of the Liverpool Botanic Gardens, and of the progress of horticulture and botany in Liverpool, alluding to the Roscoes, the Tyermans, and others who had made Liverpool famous in the annals of horticulture. He alluded to the fact, that owing to its position many plants of great interest and value had been first introduced into Liverpool by Liverpool men, including *Cattleya Mossie*, named after a lady belonging to a family well known in Liverpool.

Dr. HOGG proposed a cordial vote of thanks to Sir T. Lawrence for presiding on this occasion, and for his presence at Liverpool when urgent private affairs might have served as an adequate excuse for his absence.

Sir TREVOR LAWRENCE, in replying, alluded to the debt the public owed to the gardeners for the improvement of flowers, fruits, and vegetables, due to their exertion, and claimed for the old Society no inconsiderable share in the promotion of the present condition of horticulture in this country. He concluded by gracefully expressing the thanks of the Society to Mr. Barron, Mr. Dick, and the staff generally, and also to Mr. Richardson, Mr. Ker, and others, without whose energetic and well-directed labours, the success they had achieved could not have been compassed.

THE DINNER.

The dinner offered by the Council to the Mayor of Liverpool was held on Wednesday evening at Wood's Pavilion, in the Liverpool International Exhibition. The Hon. and Mr. J. T. Boscawen presided, and among those present were Sir David Radcliffe (Mayor of Liverpool), Major Mason, Messrs. P. H. Kathon, Holbrook, Gaskell, Prange, Haughton, Lee, Pilkington, Lee Bapty, Barrow, Richardson, Dr. Hogg, and others. The dinner being over the Chairman read a letter of apology from the President of the Society, in which Sir Trevor Lawrence expressed his regret that, owing to an important election engagement, he was unable to be present that night. Letters apologising for non-attendance were also read from the Duke of Westminster, Lord Stratton, Sir Thomas Edwards Moss, Lord Derby, and Lord Lathom. The loyal and patriotic toasts having been honoured, Mr. Wm. Haughton, the Treasurer of the Society, gave "The Health of the Mayor of Liverpool," which was received with loud applause. In acknowledging the compliment, the Mayor proposed the health of the batman, which was well received. The toast having been acknowledged in a suitable manner, Mr. Lee, the Secretary to the Society, gave the health of the foreign visitors, which was responded to by MM. J. Von Volxem and Pynaert Von Geert. The "Visitors' Health" was next given, and responded to by Mr. Prange, after which the proceedings terminated.

DENDROBIUM CRYSTALLINUM, Rehb. f.—A remarkably fine individual is in the hands of Mr. H. J. Ross, Castagnolo à Lastra e Signa, near Florence. The sepals and petals have fine purple spots. There is no large spot at the apex of the lateral sepals. The lip is shorter and rounder, but of the usual colour. The question is whether it will keep constant, and whether more individuals of the same kind will reappear. In such a case a name would be desirable. I have not seen the characteristic anther, but there is no doubt of the plant being rightly referred to *Dendrobium crystallinum, H. G. Rehb. f.*

YORK GALA: June 23, 24, and 25.

This show was the best the Society has had for some years, with the exception of the class for cut roses, which flowers have been so regarded in Liverpool by the unprecedented continuance of cold sunless weather, that few of the growers, even in the southern parts of the kingdom were capable of putting in an appearance. Orchids were shown in beautiful condition, and in much greater numbers than they have been on any previous occasion at York. This was owing to the exertions of the Secretary, Mr. Wilson. The number of people that may be seen crowding round the groups of orchids at any exhibition is evinced by the interest that is taken in them by those even, who understand little about them. Noting this, Mr. Wilson got up a subscription amongst a few friends for special prizes. The amount raised (£25) was offered independent of the prizes in the usual classes for these plants. So well satisfied were the committee with the response made by the exhibitors, that the Sheriff of York proposed that the amount offered in special prizes for orchids be doubled next year, and £30 of the money was subscribed on the spot. Stove and greenhouse plants, including flowering and fine-foliage kinds, were present in excellent condition. Pelargoniums, as usual at York, were shown in beautiful order, reminding us of the way these plants were brought out at the metropolitan exhibitions in times past.

STOVE AND GREENHOUSE PLANTS.

In the open class of sixteen, ten in bloom and six fine-foliage, Mr. Letts, gr. to Zealand, Aker, and Richmond, Yorks, took 1st, with a fresh, well-flowered group, his best blooming examples being *Phenocoma proliera*, large and full of flowers; a grand specimen of *Erica depressa, E. tricolor* Wilsoni, *Isora Williamsii*, finely bloomed, and a couple of specimens of *Anthurium Scherzerianum*; the most noteworthy of the foliage specimens were *Encphalartos villosus*, *Kentia Fosteriana*, *Croton Queen Victoria*, and *C. Weismanni*. Mr. Cypher, Cheltenham, who was a good 2d, had, amongst others, *Isora regina*, *I. Williamsii*, both with *Erica tricolor* Wilsoni, *W. affinis*, and *Darwinia tulipifera*; 3d, Mr. Berry, gr. to Alderman Dove, York.

Six stove and greenhouse plants in bloom (amateurs).—1st, Mr. Letts, whose most noteworthy specimens here were *Isora Fraseri*, *I. Williamsii*, and *Draecophyllum galeatum*; 2d, Mr. Johnson, gr. to J. B. Hoyle, 15, Darlington, who, with others, had nice plants of *Aphelex macrantha rosea*, *Anthurium Scherzerianum*, and *Phenocoma proliera*.

Three stove and greenhouse plants (amateurs).—1st, Mr. Adams, Newcastle. *Erica tricolor* Wilsoni, *Anthurium Scherzerianum* being the best; 2d, Mr. James Stanley, gr. to W. N. Champion, Esq., Halifax.

Three Heaths.—1st, Mr. Cypher, staging medium-sized plants of *Erica tricolor* Wilsoni, *E. ampullacea obtata*, and *E. ventricosa grandiflora*; 2d, Mr. Johnston.

FINE-FOLIAGE PLANTS

were well shown by Mr. McIntyre, gr. to Mrs. Gurney-Pease, Darlington, and Mr. Cypher, who, in a close run, took 1st and 2d in the open class for six in the order of their name; Mr. Noble, gr. to T. Fry, Esq., Darlington, who also exhibited well, was 3d. Three fine-foliage plants.—1st, Mr. Letts, who had a copy of *Kentia* and a fine specimen of *Cordylone indivisa*; 2d, Mr. Rollinson, gr. to W. Bateman, Esq., Harrogate.

Four Crotons.—1st, Mr. Letts, with large well furnished examples of *Glechiena Winklendi*, *G. Fourdrasiana*.—1st, Mr. Noble, who had well grown plants; 2d, Mr. Johnston.

FERNS.

In the open class for six varieties Mr. Johnston took the lead with fine specimens of *Glechiena Winklendi*, *G. Adamsiana*, *Davallia Mooreana*, *D. hienisii*, *Dicksonia antarctica*, and *Adiantum Farleyense*; 2d, Mr. McIntyre, who in a good half-dozen had beautiful examples of *Adiantum siculum*, *A. Williamsii* and *Davallia bullata*.

Three Ferns.—1st, Mr. Noble, with good plants of *Cheilanthes subarticulatum*, *Davallia Mooreana*, and *Glechiena Winklendi*; 2d, Mr. McIntyre.

Single Tree Fern.—1st, Mr. Nash, gr. to Captain Starkey, York, with a fine specimen of *Dicksonia antarctica*; 2d, Mr. R. Simpson, Selby.

Hardy Ferns, as usual, at York were beautifully shown, Mr. W. R. Robinson, York, being a long way ahead in the class for ten, having with others very large and fresh examples of *Adiantum pedatum*, *Athyrium plumosum*, *Polypodium phegopteris*, *Trichomanes radicans*, and *Osmunda regalis cristata*; 2d, Mr. W. H. Rodwell, York.

Six hardy Ferns.—Here also Mr. W. R. Robinson was 1st, with large fresh plants; 2d, Mr. W. H. Rodwell.

ORCHIDS.

With twelve in the open class, Mr. Hill, gr. to J. Hardy, Esq., Timperley, Manchester, took a decided lead, showing a fine dozen containing splendid plants of *Odontoglossum vexillarium*, both the dark and the light coloured varieties, each 2½ feet in diameter, masses of flowers; good specimens of dark and light forms of *Cattleya Mossie*, *C. Mendeli*, *Lelia purpurata*, *Cypripedium Stonei*, *C. barbatum*, and *Dendrobium fimbriatum ocellatum*; 2d, Mr. Cypher, who had a good collection, the best of which were *Saccolabium guttatum*, with unusually fine spikes; *Dendrobium Dearei*,

large and finely bloomed; *Epidendrum vitellinum*, a good variety of *Cattleya Mendeli*, *Cypripedium leucatum*, and a good specimen of *Odontoglossum vexillarium*; 3d, Mr. Mitchell, gr. to Dr. Ainsworth, Manchester.

Eight Orchids (open).—Here again Mr. Hill had 1st honours, staging in this class also a grand lot of plants, the most noteworthy of which were a large profusely flowered example of *Cattleya Mossie*, *C. Mendeli*, a beautifully bloomed *Cypripedium Lawrenceanum*, *C. Parishii*, *Masdevallia Harryana*, and *Vanda suavis*. 2d, Mr. Cypher, whose group contained *Anguloa Clowesii*, *Dendrobium suavisimum*, and an immense specimen of *Epidendrum vitellinum*; 3d, Mr. Mitchell.

Four Orchids (amateurs).—1st, Mr. James Sunley, with well-flowered plants of *Dendrobium Devonium*, *D. densiflorum*, *Cypripedium barbatum*, and *Odontoglossum crispum*; 2d, Mr. John Sunley, South Milford; 3d, Mr. Rollinson.

Single Orchid.—1st, Mr. Letts, with a large and finely bloomed specimen of *Aerides odoratum purpuratum* bearing some thirty spikes; 2d, Mr. Nash, who had a well flowered plant of *Saccolabium guttatum*.

PELARGONIUMS

were not quite so numerous as usual here, but were shown in fine condition.

With twelve show varieties Mr. Eastwood, gr. to Mrs. Tetley, Leeds, was well in front with specimens from 3 to 4 feet in diameter and densely flowered, the most noteworthy being *Albino*, *Madame Haire*, *E. Bertelsch*, *Beauty*; 2d, Mr. McIntosh, gr. to J. T. Hingston, whose plants were well flowered but smaller; 3d, Mr. Year, gr. to Miss Stewart.

Six show varieties.—1st, Mr. Eastwood—here likewise staging large and finely bloomed examples.

Three stove varieties.—With these also Mr. Eastwood scored 1st honours with plants of a similar description to those he had in the larger classes.

Twelve zonals.—These were quite equal to the larger flowered sorts in size and condition. Mr. Eastwood being a good 1st, staging large plants covered with well developed flowers; 2d, Messrs. Pybus & Son, Ripon, who also staged a fine dozen; 3d, Mr. Macintosh.

Six zonals.—1st, Mr. Eastwood; 2d, Mr. Year. The 1st prizes in the classes for six and for three fancy Pelargoniums were taken by Mr. Eastwood.

Six variegated varieties.—1st, Messrs. Pybus & Son. Six branched Pelargoniums.—1st, Mr. J. Bellerby.

FUCHSIAS

were well represented, there being some half-dozen exhibitors in the class for six. Mr. J. Bellerby taking 1st honours with six plants in flowered plants, not too stiffly trained; 2d, Mr. Macintosh.

Three Fuchsias.—1st, Miss Wharton; 2d, Mr. J. Bellerby.

GROUPS OF MISCELLANEOUS PLANTS ARRANGED FOR EFFECT.

These were a leading feature of the show. In the class for groups occupying a space of 250 feet, Mr. McIntyre took the lead with a well arranged exhibit, the flowering, and also the fine-leafed plants employed being alike suitable; 2d, Mr. R. Simpson, Selby, who likewise had a meritorious group; 3d, Mr. Johnston.

In the group occupying 150 feet, Mr. McIntyre was also well in front, staging a very effective arrangement; 2d, Mr. Noble, who likewise showed well; 3d, Mr. Macintosh.

POT ROSES

were nicely shown, mostly in the shape of medium sized plants. With six distinct varieties (open) Messrs. Pybus & Son, Ripon, were 1st, having a pretty half-dozen; 2d, Messrs. Jackson & Co., Bedale.

Nine Roses, in 8-inch pots (open)—1st, Messrs. Jackson & Co.; 2d, Messrs. Pybus & Son; 3d, Messrs. Pybus & Son.

Six Roses (amateurs).—1st, Mr. Eastwood, who had well flowered plants; 2d, Mr. Year.

Three Roses.—1st, Mr. Year.

Six Tea Roses.—1st, Messrs. Pybus & Son; 2d, Mr. Year.

CUT FLOWERS.

There was a thin show of cut Roses. With forty-eight (open). Mr. May, Hope Nurseries, Bedale, took 1st, Mr. Eastwood being 2d.

Forty-six (open).—1st, Mr. May; 2d, Mr. House, Peterborough.

Twenty-four (open).—1st, Mr. May; 2d, Mr. Eastwood.

Twelve white and yellow Roses.—1st, Mr. Eastwood.

Twelve Tea varieties.—1st, Mr. Dawe, Newent, Gloucestershire.

Eighteen Roses (amateurs).—1st, Mr. Eastwood.

Twelve (amateurs).—1st, Mr. Year.

Basket of Roses.—1st, Mr. House.

Two bridal bouquets.—1st, Mr. Cypher; 2d, Mr. McIntyre.

Two ball bouquets.—1st, Mr. Cypher; 2d, Mr. McIntyre.

Twelve bunches of stove and greenhouse flowers.—1st, Mr. Letts; 2d, Mr. McIntyre; 3d, Sir J. Pease, Guisborough.

Twelve bunches hardy herbaceous flowers.—1st, Mr. J. Holmes.

FRUIT.

With eight dishes Mr. G. T. Miles, gr. to Lord Carrington, Wycombe Abbey, took 1st, staging Madresfield Court Grapes, small, but well finished; Buckland

LONDON: Atmospheric Pressure.—During the week ending June 26, the reading of the barometer at the level of the sea increased from 29.82 inches at the beginning of the week, to 30.08 inches by 1 P.M. on the 21st, decreased to 29.77 inches by 1 P.M. on the 23rd, increased to 30.04 inches by 9 A.M. on the 24th, decreased to 29.99 inches by 5 P.M. on the same day, increased to 30.04 inches by 9 A.M., and decreased to 30.02 inches by 5 P.M. on the 25th, increased to 30.09 inches by 9 A.M. on the 26th, and was 30.05 inches by the end of the week.

The mean reading of the barometer for the week at the level of the sea was 29.99 inches, being 0.01 inch lower than last week, and the same as the average of the week.

Temperature.—The highest temperature in the shade in the week was 76° 5 on the 26th; on the 21st the highest temperature was 57° 0. The mean of the seven high day temperatures was 67° 2.

The lowest temperature was 45° 2, on the 21st; on the 23rd, the lowest temperature was 53° 0. The mean of the seven low night temperatures was 49° 8.

The greatest range of temperature in one day was 24° 5, on the 26th; on the 22nd the smallest, was 10° 9. The mean of the seven daily ranges was 17° 4.

The mean temperatures were, on the 20th, 55° 3; on the 21st, 50° 3; on the 22nd, 56° 1; on the 23rd, 60° 1; on the 24th, 58° 9; on the 25th, 61° 4; and on the 26th, 64° 0; of these the first five were below their averages by 4° 6, 9° 8, 4° 3, 0° 6 and 2° 0 respectively, and the last two were above by 0° 3 and 2° 8.

The mean temperature of the week was 58° 0, being 4° 0 higher than last week, and 2° 6 below the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the fall rays of the sun, was 133° 5, on the 24th. The mean of the seven readings was 121° 9.

The lowest reading of a minimum thermometer placed on the grass was 37° 7, on the 24th. The mean of the seven readings was 43° 1.

Rain.—Rain fell on the 22nd to the amount of 0.04 inch.

ENGLAND: Temperature.—During the week ending June 26, the highest temperatures were 78° 0 at Cambridge, 76° 5 at Blackheath, 73° 8 at Plymouth; the highest at Sunderland, 63° 0, at Liverpool, 64° 8, at Newcastle, 65° 0. The general mean was 60° 7. The lowest temperatures were 41° 7, at Wolverhampton, 42° 4 at Cambridge, 43° 7 at Bristol; the lowest at Preston was 50° 7, at Liverpool, 48° 7, at Newcastle, 48° 5. The general mean was 45° 5.

The greatest ranges were 35° 6 at Cambridge,

31° 3 at Blackheath, 27° 8 at Wolverhampton; the least ranges were 16° 1 at Liverpool, 17° at Newcastle, and 18° at Sunderland. The general mean was 24° 2.

The mean of the seven high day temperatures was highest at Cambridge, 69° 7, at Plymouth and Brighton 68° 2; and was lowest at Sunderland 60° 7, at Liverpool 60° 8, and at Newcastle 61° 3. The general mean was 64° 4.

The mean of the seven low night temperatures was highest at Plymouth, 52° 5, at Preston 51° 7, at Liverpool 51° 1; and was lowest at Wolverhampton, 46° 8, at Hull 47° 7, and at Cambridge 47° 4. The general mean was 49° 5.

The mean daily range was greatest at Cambridge 21° 6, at Brighton 18° 1, at Blackheath 17° 4; and was least at Liverpool 9° 7, at Newcastle 12° 1, at Bradford 12° 7. The general mean was 14° 9.

The mean temperature was highest at Plymouth 58° 6, at Blackheath 58° 0, at Brighton 57° 4; and was lowest at Sunderland 52° 5, at Hull 52° 7, at Wolverhampton 53° 1. The general mean was 55° 2.

Rain.—The largest falls were 0.15 inch at Preston, 0.14 inch at Brighton, 0.08 inch at Cambridge and Liverpool; the smallest falls were 0.01 inch at Hull and Bradford. No rain fell at Truro, Plymouth, Bristol, Sheffield, or Leeds. The general mean fall was 0.04 inch.

SCOTLAND: Temperature.—During the week ending June 26, the highest temperature was 79° 7, at Perth; at Leith the highest was 67° 9. The general mean was 73° 4.

The lowest temperature in the week was 41° 5, at Aberdeen; at Paisley the lowest temperature was 47° 7. The general mean was 44° 9.

The mean temperature was highest at Perth, 56° 5, and lowest at Greenock, 53° 9. The general mean was 55° 3.

Rain.—The largest fall was 0.35 inch at Greenock, and the smallest fall was 0.01 inch at Leith. No rain fell at Glasgow, Dundee or Perth. The general mean fall was 0.07 inch.

JAMES GLAISHER, F.R.S.

Enquiries.

"He that questioneth much shall learn much"—BACON.

DOUBLE SWEET BRIER.—Can any reader state where this can be procured? It is said to be known in the neighbourhood of Southampton.

Answers to Correspondents.

* OUR TELEGRAPHIC ADDRESS.—Our correspondents are requested to bear in mind that our Registered Telegraphic Address is "GARDENERS, LONDON." Telegrams (but not letters) thus addressed will reach the Editor or the Publisher without other address being needed.

ADIANTEM CAPILLUS-VENERIS: Old Reader. Whether this can be shown as a hardy British Fern is one of the debatable points connected with the exhibition of Ferns, and would be decided by the particular views of the judges. We should say it is not admissible, because not truly hardy, though it may survive in a very favourable sheltered situation. We have had it killed in an unheated greenhouse, which would appear to be a favourable position rather than otherwise, and yet it has succumbed, the plants being, of course, frozen. Unless an exceptionally large specimen, it is scarcely bold enough to group with other British Ferns.

COVERING UP BEECH TREES AND KILLING ANTS. G. Miller. It would hardly do to cover up the trunks of the trees with the earth, but you can build a wall of bricks round the tree (allowing a little space between the wall and the tree), so as to keep the pressure of the earth off the trunk, and to allow air. Ants may be best destroyed by diluted carbolic acid, gas-tar, guano-water, and paraffin being poured into their nests.

INSECTS: H. M. The objects found inside an acorn, at Cannes, in January, are quite new to us. They are the cocoons or cases including a parasitic Hymenopterous larva with horny tubular mandibles. Please send more particulars. Were all found in one acorn? — J. K. Your Pear tree has been infested, under the bark, with the larve of a small moth (Tortrix Webrana, *Gardener's Chronicle*, September 6, 1884, or *Cephalora*, *Gardener's Chronicle*, 1854, p. 304.) The pupa skins are left in the burrows, the moths having escaped. The extravasated sap has exuded from the wounds made by the insects.—Chelsea. We have only found a very few individuals of a thrip on the leaves sent—no mites. Try repeated fumigation with arser

Sweetwater, nice bunches, nicely coloured; a Queen Pine; Grasse Mignonette Peaches, very fine; Lord Napier Nectarines; good Black Circassian Cherries; a good dish of Negro Large Figs; and a Longleaf Perfection Melon; 2d, Mr. McIndoe whose best dishes were Bellegrade Peaches, Lord Napier Nectarines, Brown Turkey Figs, and Black Hamburg Grapes; Mr. Dawes, gr. to the Hon. Mrs. Meynell-Ingram, Temple-Newcome, Leeds, was a good 3d.

Six dishes.—1st, Mr. Dawes: in his collection was a good Queen Pine, Madresfield Court and Foster's Seedling grapes, both in good condition; fine coloured Belle Beauce Peaches, and a Longleaf Perfection Melon; 2d, Mr. McIndoe, with, amongst others, Black Hamburg Grapes, Best of All Melons, and a nice dish of Brown Turkey Figs.

Four dishes.—1st, Mr. Clayton, gr. to J. Fielden, Esq., Grimston Park, with a few Peaches, Violette Hative Nectarines, both well coloured; Black Hamburg Grapes, and a fine Melon; 2d, Mr. Wallis, gr. to Sir H. M. Thompson.

Single Pine.—1st, Mr. Clayton, who had a good Queen; 2d, Mr. Miles, with the same variety.

Peaches were well shown, Mr. McIndoe and Mr. Wadds, gr. to Lord Middleton, being 1st and 2d in the order of their names.

Fish of nectarines.—1st, Mr. Black, gr. to the Misses Pease, with a good dish of Pine-apple; 2d, Mr. Miles, showing Lord Napier, in fine condition.

Three bunches of Black Hamburg Grapes.—1st, Mr. Hickson, Tadcaster, who had well coloured berries, a little thin in the bunches; 2d, Mr. Wallis; 3d, Mr. Alsop, gr. to Lord Hobart.

Three bunches Muscats.—1st, Mr. Dawes.

Three bunches of white Grapes, any variety.—1st, Mr. Alsop, with Buckland Sweetwater, good bunches, in beautiful condition; 2d, Mr. Chuck, gr. to P. Thelwell, Esq., Doncaster, with White Tokay; 3d, Mr. Miles.

Strawberries were well shown, Mr. Wadds taking 1st, with a fine dish of James Veitch; 2d, Mr. Chuck, with British Queen.

Figs.—1st, Mr. Hare, gr. to R. H. C. Neville, Esq., with Black Tartarian, a beautiful dish; 2d, Mr. Miles.

Figs.—1st, Mr. McIndoe, with good Brown Turkey; 2d, Mr. Miles, with Negro Largo.

White-fleshed Melon.—1st, Mr. Blakey, gr. to the Rev. Canon Newton, Driffield, with a good fruit of Exquisite; 2d, Mr. McIntyre.

Green-fleshed Melon.—1st, Mr. Dawes; 2d, Mr. Hare.

Scarlet-fleshed Melon.—1st, Mr. Chuck; 2d, Mr. Miles.

Mr. B. S. Williams, Victoria Nursery, Upper Holloway, exhibited a very fine group of Orchids, stove and greenhouse flowering and fine-leaved plants.

Fancy Pansies were beautifully shown by Messrs. Harkness & Son, Beccles, who staged over half a hundred varieties—large flowers, prettily marked, and in exceptionally good condition.

Pansies and Violas were also well shown by Messrs. Kent & Brydon, Darlington; Pansies by Mr. W. K. Mearns, Middleborough.

Messrs. J. Laing & Co., Forest Hill, had, as usual, a fine stand of C. Begonias, double and single varieties.

THE SCOTTISH PANSY.

This Society held its forty-second annual show in the Oldfellows' Hall, Forrest Road, Edinburgh, on the 18th inst. The severity and prolonged continuance of the bygone winter, and the harsh winds and low temperature of the spring had rendered Pansy culture extremely precarious and difficult this season. Hopes of a good show and of flowers of first-class quality being brought together, were therefore not very high till the entries began to come in, when it became clear to the committee that the muster would at least be a good one. The quality of the individual blooms was also fairly good. A lack of smoothness and cleanness of colouring marked many samples of fancies, while in respect of size and substance there was a noticeable falling off in the blooms of show varieties, which in the circumstances alluded to was quite to be expected. Yet there were many fine flowers, and the show, though somewhat below the average in extent, was considered a very good one on the whole. The competition by ladies for honours in table decorations exclusively composed of Pansies, Violas, and Ferns, and other light greenery, was keenly contested, considering the limited materials prescribed, the table on which these exhibits were displayed, formed a very attractive feature of the show.

The leading prizetakers amongst nurserymen were Messrs. Dickson & Co., of Edinburgh, who excelled in show varieties of Pansies and in bedding Violas; Messrs. Laird & Sons, who carried off the 1st prize for the best fancy Pansy with a fine exhibit of Princess Beatrice; Mr. Sutherland, Lenzie, who led in fancy Pansies generally; and Mr. Forbes, Hawick, who exhibited the twelve best seedling Pansies. X.

It is stated that Mr. E. J. Beale, of James Carter & Co., has been selected as a candidate on Gladstonian principles for South St. Pancras, in opposition to Sir Julian Goldsmid.

SEEDS.

LONDON: June 30.—Messrs. John Shaw & Sons, Seed Merchants, 27, Mark Lane, E.C.3., report that there were but few buyers on the seed market to-day, and nothing of interest or importance occurred. Owing to the dry weather, there is, for the moment, no sowing demand whatever. Prices, in the absence of business, are consequently without alteration. The demand for Hemp and Canary seed continues in narrow compass; white Millet maintains last week's currencies. Orders still come to hand for blue boiling Peas. Haricot Beans are in better favour. Feeding Linseed keeps quiet.

CORN.

MARK LANE: June 29.—English white Wheats about upheld their value, but red descriptions showed 6d. reduction. Foreign Wheats were adversely affected by the liberal imports of Wheat and flour, as well as by the weather, and sales of only retail extent could be effected even at easier rates. Flour was quoted 6d. lower on the week, but there has been very little done. For the barley crops it does not appear that hopes are much brightened, and from abroad last week imports into London were nil. Prices consequently steady, but with a very dragging trade. Beans, from like causes, tended to be buyers. Peas, with a slow sale, were unchanged. Oats, common sorts, were easier; good corn showed little, if any change.

June 30.—The effect of the forcing weather is to increase the flatness in the markets for Wheat and flour, and to diminish the supplies of home-grown. Where business has been done in either Wheat or flour on the spot since Monday it has been at easier rates. Barley arrives in very limited quantity from any source, and prices are steady, but the trade is very slow. Beans, from scarcity, are firm, and tend against buyers. Peas and Lentils, unchanged. Oats remain in about late rates.

Average prices of corn for the week ending June 26:—Wheat, 31s. 1d.; Barley, 24s. 11d.; Oats, 20s. 10d. For the corresponding week of last year:—Wheat, 32s. 8d.; Barley, 28s. 3d.; Oats, 22s. 4d.

FRUITS AND VEGETABLES.

COLUMBIA (East London): June 30.—Good supplies of fruit and vegetables. June 30.—Malta and Cherboung new Potatos are arriving in large quantities. Trade good. Quotations:—Gooseberries, 3s. to 4s. 6d. per sieve; Peas, 2s. 6d. to 3s. do.; do. in sacks, 4s. 6d. to 6s. per sack; Cabbages, 4s. to 8s. per tally; Radishes, 3s. to 4s. 6d. do.; Lettuce, 6d. to 10s. per score; bunch Rhubarb, 1s. 6d. to 2s. per dozen bunches; do. Greens, 3s. to 4s. do.; do. spring Onions, 6s. to 8s. do.; Parsley, 2s. to 3s. do.; do. Mint, 1s. 6d. to 2s. do.

STRAFORD: June 29.—Good supplies of all kinds of produce, and with good attendance of buyers a fair trade was transacted at the undermentioned prices:—Cabbages, 5s. to 7s. per tally; Currants, 3s. to 4s. per dozen; bunches Carrots, household, 10s. to 15s. do.; Mangels, 22s. to 25s. per ton; green Peas, 3s. to 3s. 6d. per bushel; do. 7s. to 8s. 6d. per bag; Onions, 3s. to 4s. 6d. per dozen bunches; Parsley, 1s. 6d. to 2s. do.; Cucumbers, English, 5s. to 10s. per doz.; Cherries, 1s. to 1s. 6d. per basket; Grapes, 4s. to 2s. per case; black Currants, 3s. to 5s. per basket.

POTATOS.

BOROUGH AND SPITALFIELDS: June 29.—Supplies of new are sensibly increasing, and prices lowering. Some English are showing, but the supplies are chiefly from France and Jersey. The assortment of old is unaltered a good deal, and quotations are lower. New French and Jersey round, 5s. 6d. to 6s.; Kidneys, 8s. to 9s. per cwt.; old Magnum Bonum, 7s. to 8s.; Champions, 6s. to 6s. 5d. per ton.

COLUMBIA (East London): June 30.—Jersey, St. Malo, and Cherboung new Potatos are arriving in large quantities, and meet a good sale at moderate prices. The old Potato trade is now nearly over. Quotations:—New Jersey kidneys, 5s. to 6s.; do. rounds, 4s. to 5s. 6d.; St. Malo kidneys, 4s. 9d. to 5s. 6d.; do. rounds, 4s. 6d. to 5s.; Cherboung do., 4s. 6d. to 5s. 6d. per cwt.; old; 6s. to 9s. per ton.

STRAFORD: June 29.—Quotations:—Old: Magnums, 6s. to 7s. 5d.; do. inferior, 4s. 5d. to 5s. per ton. New: Jersey Kidneys, 5s. to 7s.; do. rounds, 5s. to 6s. per cwt.

HAY.

WHITEHAPPEL: June 29.—Moderate supplies, and dull trade. Quotations:—Clover, prime, 60s. to 107s.; inferior, 70s. to 85s.; hay, prime, 70s. to 60s.; inferior, 40s. to 63s.; and straw, 25s. to 36s. per load.

CUMBERLAND (Regent's Park): June 29.—There was a good supply of meadow hay and Clover, with prices rather in favour of sellers for meadow hay. Quotations:—Clover, best, 50s. to 105s.; second, 75s. to 85s.; hay, best, 84s. to 60s.; seconds, 70s. to 50s.; and straw, 30s. to 36s. per load.

July 1.—There was a fair supply on sale. The trade was better, and prices were firm.

Consolidated Stock.—On Monday and Tuesday Gains closed at 10½ to 10¼ for both delivery and the account. The same final prices were quoted on Wednesday. Thursday's closing figures were 10¼ to 10½ for both transactions—the quotations being ex div.

"Gather Honey from Your Flowers"

NEIGHBOUR'S CELEBRATED BEE-HIVES

For taking Honey without the Destruction of the Bees.

Philadelphia Exhibition, 1876.
Paris Exhibition, 1873.

Three Silver Medals and several others awarded to

GEO. NEIGHBOUR & SONS for their IMPROVED COTTAGE BEEHIVE,

as originally introduced by them, working three bell-shaped or tray of sectional supers, is neatly and strongly made of straw; it has three windows in the lower Hive.

This Hive will be found to possess many practical advantages, and is more easy of management than any other that has been introduced.
Price, complete, £1 15 0
Stand for ditto, 0 10 6

THE GUINEA FRAME HIVE,

With metal ends to Standard Frames, and extra space at the sides to admit of chaff or other packing; also a double quilt for the cover and a case of 1 lb. sections with cover are included.
PRICE, as above, 21s.

"THE APIARY," by ALFRED NEIGHBOUR, 5s. CATALOGUE of Improved Hives and Appliances, with Drawings and Prices.

GEO. NEIGHBOUR & SONS, 127, HIGH HOLBORN, LONDON, W.C., and 149, REGENT STREET, LONDON, W. Established 1815.

HILL and SMITH'S BLACK VARNISH, for Preserving Ironwork—Wood, or Stone.

Oil Paint no Longer Necessary.
This VARNISH is an excellent substitute for oil paint or any outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of forty years ago by the Advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requiring no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of most of the Nobility and Gentry, from whom the most flattering testimonials have been received.
Sold in Casks of about 50 gallons each, at 1s. 6d. per gallon, at the Manu factory, or 1s. 8d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL.

From ALFRED LOWE, Esq., *The Ryties, Alderley Lodge.*
"Some twenty years ago I used your Black Varnish, and shall be glad if you will forward me a cask, as I consider it the best thing known for the preservation of all outdoor work, either wood or iron, that requires to be painted."
CAUTION.—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.

Every cask is legibly marked with their name and Registered Trade Mark, as above, without which none genuine.
Large Illustrated CATALOGUE on Fencing, Hurdles, Field and Entrance Gates, &c., sent free on application to

TO FLORISTS.—A young Lady (age 18) wishes for a situation; experienced in all its branches. Good references, given.—E. TAYLOR, 10, Saunders Terrace, Kewal Green, W.

HOLLOWAY'S OINTMENT and PILLS.

Those who have given these remedies a fair trial freely admit that they inherently possess every property suitable for healing and Removing Eruptions, Ulcerations, Piles, Abscesses, Scabs, Bad Legs, Girths, and all Disorders of the Glanular System. When carefully rubbed in the Ointment relaxes the swollen Membranes, diminishes Inflammation, assuages pain, and even alleviates engorgement, and may be used for months, or even years. Holloway's excellent preparations are effective singly, resistless in combination, and have been recommended by grateful patients to be resorted to as alteratives when all other means of regaining health have failed. Their action is temperate, not violent or reducing.

GREAT LAWN MOWER CONTEST OF THE SEASON.

Royal Horticultural Society's Provincial Show at Liverpool, June 29 to July 5, 1886,

AT LAST!

PATENT

AT LAST!

SOLUBLE PARAFFIN.

PARAFFIN OIL INSTANTLY SOLUBLE IN COLD WATER.

Gardeners will at once recognise the great importance of this announcement. The chief drawback to the use of this well-known and Cheap Insecticide is at last removed.

Pints, 1s.; Quarts, 1s. 8d.; Gallons, 5s. 6d.

R. M. PHILLIPPS & CO., DARTFORD, KENT.

THE SOLUBLE PETROLEUM COMPANY, CONISBORO', ROTHERHAM.

"THE COVENTRY" LAWN MOWER

(REGISTERED).

THIS MACHINE has been very considerably improved since last season, and the Manufacturers can recommend it with increased confidence. The Roller is now made the full width of the Machine. The Knives have been strengthened, and all sizes have Steel Blades. The Gearing has been improved, and the arrangement for regulating has been simplified. It will turn in its own width, is light, and easily worked, will cut wet or dry grass of any length. It is made in Coventry by skilled English workmen, of best English iron and steel.

PRICES of GRASS BOXES (each):—8-inch, 8s; 10-inch, 8s. 6d.; 13-inch, 9s.; 15-inch, 9s. 6d.; 18-inch, 10s. 6d.

WOOD ROLLERS (for attaching to Machine when Cutting Verges):—8-inch, 2s. 6d.; 10-inch, 2. 9d.; 13-inch, 3s.; 15-inch, 3s. 6d.; 18-inch, 4s.

Chertsey.

In the village of Thorpe, about 20 miles from London, in a healthy and picturesque neighbourhood, twenty-five minutes' walk from Chertsey Station.

IMPORTANT to GENTLEMEN AND OTHERS seeking a compact FREEHOLD ESTATE, with advantages for combining business with pleasure. For Sale, with possession.

MESSRS. PROTHEROE AND MORRIS are instructed by the owner and occupier, who is leaving the neighbourhood, to SELL by AUCTION, at the Mart, Tottenham Court Road, on FRIDAY NEXT, July 10, at 12 o'clock precisely, the valuable FREEHOLD ESTATE, known as the West End Fruit Garden, Thorpe, near Chertsey, embracing a total area of about 100 acres, and containing a grand stock of Fruit Trees and Bushes in bearing condition, a large Garden Produce. There is a modern brick-built Residence, containing seven Bedrooms, Dressing-rooms, fitted Bath-rooms, three Reception-rooms, two Billiard-rooms, and a domestic room; numerous Glass Erection and Sheds, brick-hull Cottage and Stabling; the fruit garden is bounded on one side by a concrete wall, 6 1/2 feet in length. The property has a frontage of 1100 feet to the road from Staines and Windsor to Chertsey, a portion of which can be easily utilised for building, without detriment to the remainder of the estate. The estate also possesses a great prospective building value, and a portion contains a valuable bed of the best gravel to a good depth. May be viewed at the Mart, and conditions of Sale may be had on the Premises, at the Mart, E.C.; of W. Sharp, Esq., Solicitor, 9, Walbrook, E.C.; and of the Auctioneers and Surveyors, 67 and 68, Cheapside, E.C.

Bothwell Castle Collection of Heaths.

Very Important Public Sale of the RARE and CHOICE COLLECTION of Heaths in Bothwell Castle, Bothwell, N.B., cultivated by the Earl of Andrew Turnbull for the Right Honourable the Earl of Home. MESSRS. MORRISON, DICK, AND MCCULLOCH are instructed by the Right Honourable the Earl of Home to SELL by AUCTION, at 12 o'clock, on 2 and 3, BUCHALLACH, Bothwell, N.B., on THURSDAY, July 29, at 12 o'clock Noon, the COLLECTION of RARE and CHOICE HEATHS, well known to be the most important and unique in the United Kingdom, and containing many Varieties unknown to this collection.

The collector of the above says:—"The cultivator can scarcely err in possessing himself of the different varieties originated by such men as Mr. Turnbull of Bothwell Castle, who his name has been raised more excellent varieties than any other man of his day."

The whole will be on View in the Houses on Monday, Tuesday, and Wednesday, July 25, 27, and 28, from 10 a.m. to 4 p.m., and on Forenoon till Half Hour of the Day. To prevent overcrowding, admission by Catalogue only (price Sixpence, returnable to all purchasers), on application at our office, 93, Southchill Street, Glasgow; or forwarded by post on receipt of Sixpence in Stamps.

MORRISON, DICK, and MCCULLOCH, Auctioneers

Gardiff.

SALE OF FLORISTS' and MARKET GARDENERS' BUSINESS.

MR. W. COURTENAY CLARKE is instructed to OFFER for SALE by TENDER, as a going concern, subject to conditions, the BUSINESS of Mr. William Thomas, 6, Crockerhollow, Cardiff, and Whitechurch, Seedman, Florist, and Market Gardener. The shop is situated in a large and airy building, and is well adapted for every accommodation for the carrying on of an extensive business. In the rear are large and well-constructed Hothouses, fitted with every appliance, and fitted with a choice selection of Plants. A Lease of the Premises may be obtained at the rate of £50 a year, tenant paying rates and taxes. The Garden and Ground at Whitechurch (near Cardiff) have been under careful cultivation for a long period, and are well supplied with Fruit, Shrubs, Flowers, and Ornamental Trees. The rent of the Gardens at Whitechurch is £45 per annum. The Sale presents a capital opportunity to any Florist and Grower desirous of obtaining an old-established business on favourable terms. Separate Tenders must be delivered to the Broker for the business, which is offered in the following order:—1st, the right of obtaining a Lease of the Premises; 2nd, the right of obtaining the Garden and Ground at Whitechurch; 3rd, the right of obtaining the right of accepting the highest aggregate Tender for Lots 1 and 2, and would point out that by acquiring the Goodwill of the purchase the business will in a large measure secure the valuable connection already formed. Schedules of the Stock, Plant, Trade Utensils, and Book Debts must be seen at the Office of the Broker, to whom all Tenders must be delivered on or before July 13, 1886.

For further particulars application may be made to F. C. GOODCHILD, Esq., 25, Old Jewry, London, or to the Broker, at his Office, 1, Crockerhollow, Cardiff, June 29, 1886.

THE LIVERPOOL HORTICULTURAL COMPANY (John Cowan), Limited.

J. JENSEN & CO.'S
NORWEGIAN

FISH-POTASH MANURE.

Fish Manure is composed of flesh and bone—the best of all fertilising materials, and in combination with pure Salts of Potash and Magnesia forms a perfect fertiliser, as it contains the important ingredients of Ammonia, Phosphates and Potash in their most concentrated and available form. It is equally valuable for Farm Use, for Fruits, Flowers, and Vegetables, and produces wonderful growth, especially with Vines.

The Average Manurial Constituents are as follows:—

Cod Fish and Potash.		Herring and Potash.	
Per Cent.		Per Cent.	
7.0	Ammonia 30	20.0	Phosphates 20
15.0	Potash 15.0	10.0	Magnesia 10.0

Or, in other words, a ton of COD FISH and POTASH is composed, approximately, of—

10 cwt. of Dried Fish Flesh—Organic Matter.
5 cwt. of Dried Fish Bone—Phosphates.
3 cwt. Sulphate of Potash.
1 cwt. Sulphate of Magnesia.
1 cwt. of Moisture, the ingredients not of manurial value.

The Prices are £10 per Ton (bags included) for the COD, and £9 for the HERRING, on Rails in the Docks, subject to Discount for prompt Cash.

Retail Prices, Carriage Paid, upon receipt of P.O. IN TINS.—1 lb. for 1s.; and IN BAGS, 7 lbs., 2s.; 14 lbs., 4s.; 28 lbs., 6s. 6d.; 56 lbs., 10s. 6d. 1¼ cwt., 20s.; 2 cwt., 30s. Bags free.

Apply to all Nurserymen and Florists, or to

J. JENSEN & CO.,
10, ST. HELEN'S PLACE, LONDON, E.C.

For Perfect Tennis Lawns, Bowling Greens, and CRICKET PITCHES, use
"BENTLEY'S WEED ERADICATOR."
The DAISY and WEED ERADICATOR. Manufactured by HURST and SON, 152, Houndsditch, London, E. To be obtained (with useful instructions) from all Seedsmen and Florists everywhere. Sample Dredger-canister, 1s. per post.

HORTICULTURAL SOILS, MANURES, SUNDRIES, and BERKSHIRE POTTERY. Catalogues Free per post, of every Horticultural Requisite.—**BENJAMIN FIELD, F.R.H.S.** (Son-in-law and Successor to J. Keumar), Swan Place, Old Kent Road, London, S.E. Established 1834.

NATIVE GUANO, price £3 10s. per ton, in bags on rail, Aylesbury. Lots under 10 cwt. 4s. 6d. A cwt. sample bag sent, carriage paid, to any station in England on receipt of Postal Order for 2s.

Extracts from Tenth Annual Report of the Native Guano for Potatoes.—**H. S. EASY,** Great Tofham, Essex.—"Used for Potatoes. Good. Consider this manure about the best for Potatoes. Very economical. Took about twenty prices." Native Guano for Vegetables and Fruit Trees.—**J. SMITH,** Head Gardener to the Right Hon. Lord Rosbery.—"Used for Peas, Onions, Lettuces, Cabbages, Potatoes, Turnips, and Fruit Trees. Onions a splendid crop. Other crops most satisfactory." Native Guano for the "Great and Safe" manure I have tried.—**D. WILLIAMS,** Gardener to Lord Wimborne.—"Used for Vines. Strawberries in pots. Peaches, Asparagus, Onions, &c. Very good on all kinds of trees."—**A. F. EASTON,** Royal Horticultural Society, Chiswick—"Without doubt, a very valuable manure, and easy of application."—Orders to THE NATIVE GUANO CO. (Limited), 25, New Bridge Street, Blackfriars, London, E.C., where Fancifuls of Testimonials may be obtained.

ORCHID EXHIBITION.

One of the most beautiful sights in London.

ORCHIDS.—Mr. WILLIAM BULL'S ORCHID EXHIBITION. The Private View to Patrons of the Establishment is held every TUESDAY, THURSDAY, and SATURDAY, 10 to 5 o'Clock, throughout JULY. Establishment for New and Rare Plants, 536, King's Road, Chelsea, London, S.W.

ORCHIDS.—Mr. WILLIAM BULL'S EXHIBITION is OPEN to the Public every MONDAY, WEDNESDAY, and FRIDAY, 10 to 5 o'Clock, throughout JULY. Admission, each day, 2s. 6d.

ORCHIDS.—A vision of loveliness unparalleled in Europe.

ORCHIDS.—"Must be seen to be realised."

ORCHIDS.—"A scene of the greatest Orchid beauty, lasting duration, and, we had almost said, defying exaggeration."—Gardener's Chronicle.

ORCHIDS.—Specimens in Flower from Brazil, Colombia, Mexico, Ecuador, Madagascar, Assam, Peru, Costa Rica, Venezuela, West Indies, Burmah, Eoocoo, and various other parts of the Eastern Archipelago.

ORCHIDS.—Private View to Patrons of the Establishment every Tuesday, Thursday, and Saturday, 10 to 5 o'Clock, throughout JULY.

ORCHIDS.—Public Exhibition every Monday, Wednesday, and Friday, 10 to 5 o'Clock, throughout JULY. Admission, each day, 2s. 6d.

ORCHIDS.—The Exhibition is worth going any distance to see at Mr. WILLIAM BULL'S Establishment for New and Rare Plants, 536, King's Road, Chelsea, London, S.W.

Now Ready,

REICHENBACHIA.

ORCHIDS ILLUSTRATED AND DESCRIBED.

By F. SANDER, St. Alban's.

This Work is issued in Monthly Parts, each containing four beautifully Coloured Plates by eminent Floral Artists.

The History and Culture of each Plant is given in English, French, and German. The Latin Descriptions and Leaders, &c., by Professor Reichenbach.

Price of each Number to Subscribers, 7s. 6d. per Month.

Size of Plates, 21 inches by 15 inches.

Sample Copies post-free on application, to be returned in case of non-subscription to

F. SANDER, ST. ALBAN'S.

THE Gardeners' Chronicle.

SATURDAY, JULY 10, 1886.

GLYNDE PLACE.

IN consequence of the preference for foreign travel many interesting spots in our own country remain unexplored, or they are only seen in glimpses from the railway. Many persons probably, after leaving Lewes en route for Eastbourne, have taken a rapid glance from the train at Glynde, and have sometimes perhaps mistaken the church, whose architecture seems in the distance more domestic than ecclesiastical, for Glynde Place. The house of the late Speaker of the House of Commons, now bearing the family title of Viscount Hampden, lies a stone's-throw beyond the church, and is entirely concealed from view.

The village of Glynde is a place of great attraction from more than one point of view, for it is not only a delightful Southdown village, dry and clean and built upon a slope, with good cottages and gardens for working men, and several curious old houses—a village of prosperous and smiling aspect—but its history is remarkable. The rural population of England is only 10,500,000 in a total population of 26,000,000, so that 15,500,000 are born beneath a canopy of smoke instead of that of heaven. If you visit Glynde on a sunny day you will find a pure and glittering atmosphere charged with ozone, while at night this cradle of strong men and healthy women is overarched by the starry sky, without intervening fogs and smoke clouds. There is no need to discuss whether the men are better for being born in a garden country place, or a guttered town enveloped in the fumes of factories and smoke of belching chimneys. Trade, it seems, will have its streets and its crowded populations stewing in their own juice, amongst whom a third generation is never reached, the stock becoming effete. But garden spots like Glynde will have to be increased for the sake of restoring the balance of health and vigour to a country which is already startled at the predicament it stands in.

The land question, I have often thought, involves the extension of gardens. We may not get small farms since their economy may be doubtful: we shall not get peasant proprietors, because commerce in England pays better interest than land; but we must have more well-paid labourers, and more gardens, and to gardens must be added, in pastoral districts, cow plots. As regards these various details, the history of Glynde is most instructive. Here for a period of forty years John Ellman, a famous worthy of the Southdowns in his day, accomplished what every good landlord must desire—the happiness of those who dwell and labour on his property. Mr. Ellman was the agent for two of the three Lords Hampden who preceded the present highly respected peer, now the Lord-Lieutenant of Sussex, in the ownership of Glynde Place. As these former owners were absentees, their agents held the office of premier on the estate he managed, and I propose to notice briefly his system of government as the founder of a model village of the best type moral beauty being chiefly aimed at, and as a

New Fern
ADIANTUM FRAGRANTISSIMA (First-class Certificate).—In introducing for the first time this lovely Fern, which was raised in their establishment, E. G. H. & SON have no hesitation in saying that never since the introduction of *A. Farleyense* has anything approaching such a charming variety been introduced; in habit it is all that can be desired as a decorative plant, the fronds rising well from the crown, terminating into a graceful curve, forming quite a plume-like frond, while the pinnae, which are of moderate size, is beautifully cut, as in the way of *A. Farleyense* alricorne, and in a young state; the centre of the same is of a golden-green, verging off into a paler shade, and changing to a deeper green as it approaches maturity; and in addition, when growing, it is deliciously fragrant, a few plants filling the house with a sweet perfume. Either as a valuable addition to a collection, or for exhibition or decoration, this remarkable novelty is certain to become the most popular *Adiantum* in cultivation. The fronds when cut last a length of time; some which were cut on an experiment remained in perfection more than a week in a warm room. Being of a vigorous constitution, and of such surpassing elegance, it will quickly supersede the old favourite, *A. cuneatum*, for all purposes.
 Healthy plants, in 4-inch pots, each, 5s. and 7s. 6d.; 6 for 21s. and 30s.
 E. G. HENDERSON AND SON, Pine-apple Nursery, Maidon Vale, London, W.

W. GORDON, IMPORTER OF ORCHIDS STOCK from ALL PARTS OF THE WORLD.—An immense Stock of recently imported Plants compels a SALE of the Established Plants to make room. These have not yet flowered, but are all flowering plants, and must be sold at a great sacrifice. VERY VALUABLE VARIETIES are certainly to be obtained, and great bargains; see Public Journals for high prices recently obtained. THE SPECIAL OFFER affords a PAYING INVESTMENT to any one with glass at command, which should not be overlooked. SUCH PLANTS may never again be offered to the PUBLIC and the TRADE.
 Apply to W. GORDON, The Nurseries, Anyand Park Road, Twickenham, Middlesex.

creator of many gardens as well as substantial cottages. Mr. Ellman became famous to the agricultural world as the improver of Southdown sheep, the premier breed, and the most useful by far for its widespread influence in refining the mutton of other breeds of sheep. It is no small merit to have raised the price and value of innumerable flocks, to have sold at 300 guineas a pair, and to have multiplied the choicest legs of mutton and improved the cutlets of the people. The son of a small farmer, he became the personal friend of Arthur Young, and of all the famous agriculturists of his time. Francis, Duke of Bedford, would drive over to Glynde when visiting the Sussex racecourses and watering-places, and spend several days farming with his friend Ellman. The Earl of Egremont, the greatest man in Sussex, a munificent and excellent man in spite of foibles, was his close ally, as well as the Duke of Richmond, another agriculturist of note, one of the founders of the famous Goodwood flock. The Earl of Chichester of 1822 was a philanthropist like the late respected Earl and Lord-Lieutenant, and an interesting letter of his to Ellman refers his success in rendering Glynde one of the happiest and best regulated villages.

Want of space prevents my giving the details of Mr. Ellman's plan; but I may say that the epitaph on his tomb in the churchyard bears testimony, in simple language, to his fame as a breeder, and to the devotion of his life to the happiness of the people. He had been raised to the position of a county magistrate in times when such an honour was rarely conferred on a farmer, and having educated himself, he supported a school in the village and a winter evening school in his own kitchen for the purpose of instructing his poorer neighbours. His method may be generally described in his own pithy language. He preached what he practised, when he said:—

"Keep your young unmarried labourers in your own house. Let them feel the comforts of a good home, and they will be shy of risking these by improvident marriages. Let your wives and daughters personally superintend the female servants, and the latter will acquire tastes and habits adverse to hasty marriages and indifferent partners. When young farming men marry and settle in a cottage, let them have grass land for a cow and pig, and sootle enough to grow Potatoes and vegetables for their family, and above all, pay them according to their skill. Teach them to respect themselves, and they will respect their employer and protect his property. Give them the means of brewing good beer at home, and they will seek no public-house. Remove temptation by allowing as few beer-shops and pot-houses as is compatible with the convenience of travellers. Try moral measures before you coerce by penal laws."

Some of Mr. Ellman's methods may sound old-fashioned, but they are not the less excellent, and the substitutes for them, in these changed times, have yet to be found. If it be true that farm labourers have depreciated, that can only have arisen from the circumstances of their daily lives having altered for the worse. Ellman recommended attaching the labourer to the land—the reverse has been accomplished, and hence the labourers' unions, having strikes as their object, and hence the agitators whom farmers dread without having the least notion how to circumvent them, for farmers do not read—they are not inventive, and not one in 10,000 of them ever studied Mr. Ellman's plans, or heard of him as the founder of a model village.

So far as the altered conditions permit Lord Hampden is proceeding on the same lines as Ellman by means of good gardens and cottages. He is an excellent landlord and a spirited farmer. Butter, barley, and mutton are among the best products of Glynde, and it must suffice to say here that Lord Hampden has founded a herd of fifty Jersey cows, the best of butter-makers, and is building at his own cost and risk a butter factory for himself and tenants or other

neighbours. He has introduced steam cultivation on his farm—the same that Ellman held—and is producing barley and mutton beyond all precedent; and this leads to an increased wage-fund and more cottages, which, in point of fact, have been already built, with good gardens or allotments. The dinner of a flourishing friendly society, at which Lord Hampden presides, was held the day after my visit in a tent in a meadow. I can only mention further on this subject Lord Hampden's annual pastorals, which he delivers at the Glynde harvest-home, and which the country has learned to anticipate with interest.

It is time to speak of horticultural matters. Mr. Colgate, Lord Hampden's agent, had taken me to look at a silver cup won by a member of his family at Petworth in the last century, the first silver cup probably ever awarded at a livestock show, and I had seen the large room where Mr. Ellman dined on state occasions, when in passing through his first-rate farmhouse garden, he pointed to a common Acacia tree 30 feet high perhaps, and of ten years' growth. Its history is curious. The bees having swarmed Mr. Colgate placed their hive on an old stump of an Acacia which had been deprived of its roots, and had lain three years in the timber yard. Judging from the appearance of the stump the tree was aged and of good size, and this makes it the more remarkable that on fixing the stump in the earth for the purpose of supporting it firmly a dormant bud should have presently produced a shoot which has since grown into a tree, as I have just stated.

Glynde Place is a large quadrangular house, improved in the last century from the older mansion of the Morleys by Dr. Trevor, Bishop of Durham. It is situated not far from the base of Mount Caburn, one of Gilbert White's "mountains" of Sussex, and a spot dear to archeologists for its British or Roman earthworks at the crown, and at the top of the village, whose lower level rests on the railway, and on a reach of the River Ouse, which is here augmented by the Glydebourne. The rear of the house abuts on the high road; its principal fronts look upon a pleasant lawn and shrubbery on the north, and across the terrace on the east, where the landscape includes a park of 100 acres, planted with stately trees (the land being rich), and a beautifully wooded country beyond. It is a long view, extending mile after mile as far as the hills of Heathfield and the Forest Ridge, over a cultured part of Sussex, every inch of which the late Speaker is probably familiar with, loving his own few miles at home a little better perhaps than he can do, the more distant world which belongs to other people. Home must be sweet, and honours and rewards, worn with much meekness, cannot be unwelcome, when they follow a life of labour for the public good.

Glynde was first granted to a family named De Glynde, whose heiress married Sir Richard Walleys early in the fourteenth century. The male line of this knightly house became extinct, and Joane, the daughter of the last Sir John, conveyed the estate about the end of the fifteenth century to Nicholas Morley. There are numerous brasses of the Morleys, as of their successors the Trevors, in the chancel of the church. They held the estate for seven descents, when the last owner of their name, a widow, married John Trevor. Trevor after Trevor followed from 1653, the first of the possessors of Glynde bearing the name being the eldest son of Sir John Trevor, Secretary of State to Charles II., and the husband of Ruth, the daughter of John Hampden, the patriot. One of this family was created Viscount Hampden, a title which became extinct in 1824, and remained so till recently. The Brands acquired the estate by marriage with the

Trevors, and Lord Hampden's brother, the twenty-second Baron Dacre—to whose title he is heir presumptive—bears the family name of Trevor, having changed it from Brand in compliance with the will of the last Lord Hampden. H. E.

New Garden Plants.

ALBUCA (EUALBUCA) CORYMBOSA,
*Baker, n. sp.**

LIKE *Tritocia* Wilsoni, this was discovered by Mr. A. Wilson, in the neighbourhood of Port Elizabeth, and was flowered at home by his brother, Mr. John Wilson, of Greenside Gardens, St. Andrews. It belongs to the subgenus of *Albuca*, in which the three outer stamens are without anthers. It comes nearest to *A. junceifolia*, Baker, in *Gardeners' Chronicle*, 1876, p. 534; *Botanical Magazine*, t. 6395, but it has the erect flowers and corymbose inflorescence of *A. caudata* and *A. fastigiata*.

Description:—Bulb globose, above an inch in diameter; neck short; outer tunics splitting into fibres at the top. Leaves, 6—8, sub-terete, glabrous, above a foot long when fully developed, $\frac{1}{2}$ inch broad at the base, convex on both surfaces, tapering gradually to the apex. Peduncle terete, $\frac{1}{2}$ foot long. Flowers, 5—6, inodorous, arranged in a lax corymb; pedicels erect, 2—4 inches long; bracts ovate or ovate-lanceolate. Perianth an inch long, yellow, banded with green; inner segments cucullate and permanently connivent, so that the flower is cleistogamous and self-fertilised. Outer stamens without anthers. Style prismatic, as long as the oblong ovary. *J. G. Baker.*

TRITONIA (MONTBRETIA) WILSONI (*Baker*), *n. sp.†*

This was sent to me through the *Gardeners' Chronicle* from Mr. John Wilson, of Greenside Gardens, St. Andrews, N.B. It was collected by his brother, Mr. Alexander Wilson, in the neighbourhood of Port Elizabeth. The bulbs of the eastern province of Cape Colony are often different species from those of the western regions. This comes nearest to the well-known *Tritonia lineata*, Ker, in the flower, but the leaves present an entirely different type of character. Mr. Wilson has kindly sent me a complete specimen and two sketches made from the living plant.

Description:—Corm globose, $\frac{1}{2}$ inch diameter; outer coat thin, brown, reticulated. Stem slender, terete, 2 feet long below the spikes. Leaves 5—6, narrow linear, under a line broad, nearly quadrangular in section, the three lower sub-basal, 1— $\frac{1}{2}$ foot long, the others distant, superposed. Spikes simple or forked, lax, 4—7 flowered. Spathe-valves lanceolate, unequal, $\frac{1}{2}$ — $\frac{3}{4}$ inch long. Perianth white, flushed with purple; tube funnel-shaped, $\frac{1}{2}$ inch long; segments obovate-cuspidate, twice as long as the tube, the arcuate upper one the longest. Stamens reaching half-way up the limb; anthers linear-oblong, purple. Style-arms oblong-cuneate, entire, overtopping the anthers. *J. G. Baker.*

SAGENIA MAMILLOSA, *T. Moore, Illustr. Hort.*, ser. 4, vol. vi., t. 598.

Closely allied to *S. decurrens*, but with all the segments of the frond undivided, and the sori, which cover the surface, inserted in very deep cavities, so as to form a series of pointed tent-like protuberances over the upper surface. Hab.: Molucca Isles.

This distinct-looking and handsome Fern has been recently introduced from one of the Molucca Isles by the Compagnie Continentale d'Horticulture, and is figured in the publication (*Illustration Horticole*) which emanates from their establishment. It bears considerable resemblance to *Sagenia decurrens*, especially in the winged rachis and stipes; but as far as

* *Albuca (Eualbuca) corymbosa*, Baker, n. sp.—Bulbo globo, collo brevis, tunicae apice fibrosae; foliis, 6—8, subteretibus glabris utrinque convexis; pedunculo tereti foliis breviori; floribus, 5—6, inodorous in corymbum laxum dispositis, pedicellis elongatis erectis; bracteis ovatis v. ovato-lanceolatis; perianthio litteo viridi; staminibus exterioribus castratis; stylo prismatico ovario equilongis.

† *Tritonia (Montbretia) Wilsoni* (*Baker*), n. sp.—Cormo globo tunicae brunneae reticulatae; caule gracili tereti bipedali; foliis 5—6 anguste linearibus firmis glabris subquadrangularibus, 3 subbasalibus reliquis superpositis longe segregatis; spicis laxifloris simplicibus vel furcatis, spathe valvis lanceolatis inaequalibus; floribus albis tubo tubo; perianthio tubo infundibulari bracteis linearibus, segmentis obovatis cuspidatis tubo duplo longioribus; genitalibus inclusis.

we can ascertain, the lower pair of segments (pinæ) are not forked as they are in that plant, and the mamillöse surface is quite peculiar.

The plant has a stout caudex, apparently erect, and, like the erect moderately stout short stipes, is furnished with greyish scales. The early fronds are simple, lanceolate, narrow pointed, the succeeding ones bear one pair of segments, which would be pinæ if they were not united by the broad leafy wing of the rachis. In the largest fronds we have seen, and which were fully fertile, there are six pairs of these side lobes, the entire frond being about 2 feet high, of a firm, stoutish membranous texture, and a dark green colour. The costa is prominent on the under-surface, and from it branch out the numerous conspicuous pinnate veins, which are slightly bent in parallel curves, and united by anastomosing veinlets, which ultimately form small four-sided areoles, including a sorus attached to the end of a free veinlet. The sori are copious, and form transverse lines parallel to and on each side the pinnate primary veins, extending from the costa to the margin; these sori being very prominent on the upper surface par a regular close-set series of pointed nipple-like elevations, which give a peculiar roughened or rasp-like appearance to the surface as seen in the fresh unpressed fronds; on the under-surface the sori, which are sunk in deep pits, are covered by the reniform indusia. In some few Assam fronds of *S. decurrens* which we have seen, there is an indication of a similar set of protuberances, but they are not so much elevated nor acutely pointed, but give the frond more of a bullete than a mamillöse appearance.

As a garden plant it will form a bold and highly characteristic species, quite desirable in a collection which goes beyond the elegancies of Maiden-hairs and such-like subjects. It requires the temperature of a hothouse, but is a very free grower, and a good specimen would be a telling object either in the Fern-house or the exhibition tent. The figure above quoted gives a very good idea of its general appearance, except that, being much reduced to suit the size of the paper, the representation is not equal to the reality. *T. Moore.*

MORMODES LUXATUM (Lindley) PURPURATUM, nov. var., *Rehb. f.*

Last year the variety called punctatum appeared in July. Now Sir Trevor Lawrence, Bart., M.P., P.R.H.S., has most kindly favoured me with a specimen of a new variety. Its flowers are light mauve-purple. The sepals and petals bear on their inner side lines of numerous dark small spots of the same colour. The side lacinie of the lip are much darker than the central part. It is one of Mr. F. Sander's importations. *H. G. Rehb. f.*

THE GENUS ODONTOGLOSSUM.

(Continued from p. 757, vol. xxxv.)

The coronarium section is a small one, but distinct in habit of growth and flower from all the other Odontoglossums. The four which comprise the section may perhaps be considered as varieties of the same thing, differing in stature according to the localities from whence they are collected. They have all the same running habit, the old form of *O. coronarium* being the largest, and having the pseudobulbs divided by the greatest length of rhizome. All have flattish-oval, dark green pseudobulbs, more or less stained with brown, and leathery leaves. They thrive best in the coolest and shadiest part of the Odontoglossum house, and should be placed in long baskets, which by the presence of the peat and sphagnum offers facilities for the newly running growths to root. When re-basketed the leading growths should be kept as far back as possible to allow of their having rooting room before them, and if the plants have occupied all this, and it is not desirable to shift them, a raft with sphagnum moss should be fixed to the basket (like the bowsprit of a ship), in order to afford accommodation for the growths beyond the basket. *O. coronarium* and its varieties require a free supply of water all the year round, but more particularly when growing.

ODONTOGLOSSUM CORONARIUM was found by Schlim (who describes it as growing on the ground), many years ago, near La Baja, in the province of Pamplona, at the height of 7000 feet. Out of the many small importations of it but few survived, and those

quickly disappeared, until late years—the plants being collected at the proper time, and the journey being quicker made—better specimens have arrived, which most of our Orchid growers succeed well with, but many of them still fail to get their plants to flower. Good growing being put on the plants, however, the flowers are sure to follow regularly enough after the plants get acclimatised with us, or, rather, used to their altered conditions under cultivation. The flower-spikes are often 1½ foot high, bearing a score of wax-like flowers, with bright chestnut-brown sepals and petals, and a yellow lip blotched with crimson.

O. MINIATUM.—This may be regarded as a more compact and freer flowering *O. coronarium*; the flowers are borne in the same way, each 2 inches across, bright chestnut-brown, edged with yellow; lip yellow, the base and column being marked with red. Peru: 6000 feet.

O. BREVIFOLIUM is the dwarfest of the section. Hartweg found it high up on the Cordillera of Peru, near Loxa. The leaves are always short and blunt, and often broad as long. Flower similar to those of *O. miniatum*.

O. CHIRIQUENSE, Prof. H. G. Reichenbach, in *Bot. Zeitung*, October 1, 1852; Lindley, in *Tolia Orchidacea*, Odontoglossum, 62.—“Flowers as large as *Oncidium crispum*, Reich. Leaves in twos, large and green. Sepals brown. Petals and lip golden. Warszewicz, on the Cordillera of Chiriqui, at the height of 9000 feet, on decayed trunks.”

This is no doubt the Chiriqui form of *O. coronarium*, and little was known of it until Messrs. F. Sander & Co. exhibited it at the meeting of the Royal Horticultural Society, June 22, this year. It resembles a light form of *O. coronarium*, and certainly calls to mind the *Oncidium crispum*, with which Professor Reichenbach compares it, although the flowers are much thicker in texture. Messrs. Sander's plant had, however, a light brown blotch on the lip and brown marbling on the petals, which may also have been on the typical plant, but which disappeared in the drying of the flowers, or there may be varieties with petals and lip wholly yellow. It has the running habit of the typical *O. coronarium*, and requires the same mode of culture.

The plant is interesting as being one of the few we have record of as growing on decayed trees. Some more recent traveller might tell us whether the habit is constant, &c.

O. LEVE.—Found in Guatemala by Skinner and Hartweg, and described by Lindley in *Bot. Rec.*, 1844. It flowered in the gardens of the Royal Horticultural Society in 1842. Flowers on stout ascending spikes, sepals and petals yellowish, barred with brown, lip pandurate and white, rose at the base. This is a very variable species running from the smaller figured form into the higher variety named *O. Reichenheimii*, but which should more properly be called *O. leve Reichenheimii*. This seems to be the strongest and handsomest form of *O. leve*, some of the varieties being very beautiful; the sepals and petals, which have a glossy appearance, are yellowish, broadly banded with chocolate-brown, the lip varying in different specimens from white tinged with rose to pink blotched with violet. A very handsome variety of the largest and darkest kind recently bloomed with J. Neville Wyatt, Esq., at Cheltenham, bearing very handsome fragrant flowers. *O. I. auratum*, a pretty form, flowered first by Mr. F. W. Moore of Glasnevin, and afterwards named from specimen of Major Lendy of Sunbury House, Sunbury-on-Thames. It has a very narrow lip, a little dilated at the apex and acute at the top.

O. HASTILABRUM.—This is a very pretty strong growing cool Orchid, first flowered at Syon House in 1846 on a plant received from Pamplona, alt. 2500 feet. Flowers nearly 3 inches in diameter, sepals and petals pale green, even barred with purplish-brown, lip broadly hastate, white, purple at the base.

O. CARINIFERUM.—This, which is figured in *Bot. Mag.*, 1919, as *O. hastilabrum fuscum*, is amply distinct from *O. hastilabrum*. The flowers are borne on loosely branching panicles, sepals and petals greenish stained with brown on the inner side, lip three-lobed, white, changing to yellowish in the front portion, rose at the base. Veraguas: 9000 feet. These four are strictly speaking cool-house plants, but do not require so much water when the pseudobulbs are mature as the *O. crispum* section. *James O'Brien.*

HERBACEOUS PLANTS IN THE FLOWER GARDEN.

ALTHOUGH the collection of hardy plants at Hale Farm Nurseries, Tottenham, is “familiar as household words” amongst hardy plant growers, a few notes on some of the more striking kinds in blossom early in June, may possibly be of use to those who find some difficulty in keeping up a good supply between spring and summer. The slightly diminished quantity of herbaceous flowers between the two seasons is hardly noticed in gardens where flowering shrubs are well grown; for in May and early in June, these shrubs being usually at their best, may well fill a garden with beauty. In hardy-plant culture one hint may well be taken from the old half-ardue “bedding” system—the excellent effect often attainable by planting a mass of one flower. Some plants, it is true, are most effective when seen as single specimens; but in many cases a group large or small, is far preferable to a single plant of each kind. This is well illustrated at Mr. Ware's in the masses of many hardy plants which one generally sees dotted about separately. For instance, *Dodecatheon splendens*—of which hundreds of plants are grown together—forms a sheet of bright purple; and though the great quantity of this and of many other flowers grown in this nursery, may not be available in ordinary gardens, much of the effect may be obtained by smaller groups. Whether grown singly or in groups, *Dodecatheon splendens*, and the white form of *D. Meadia*, should find a place in every rockery. The latter should be planted where it can be looked at closely, as both in colour and form it is singularly pretty. The large pale blue *Camassia Fraseri* looks far better as a group than when planted singly; and *C. Leichtlini* (a darker blue than the typical *C. esculenta*) is a good plant. It is entirely different in habit and colour from the plant grown under the same name in the Edinburgh Botanic Garden. Another beautiful blue flower, especially adapted for grouping, is *Ixiolepis tartaricum*. St. Bruno's Lily, *Anthericum liliastrum*, is perhaps equally beautiful, whether planted in separate bunches or in large groups; at Hale Farm it is grown in profusion, as is also the earlier “Wood Lily,” *Trillium grandiflorum*, an excellent subject for grouping in shady spots. The same may be said of *Primula japonica* and various other *Primulas*, which lose much of their effect when planted separately. *P. luteola*, though not one of the prettiest of *Primulas*, is of value from its late-flowering habit; it comes in well for May or June with *P. japonica*, and if grown in groups its yellow colour is effective. The small form of *Thalictrum minor*, var. *adiantifolium*, is much better as a foliage plant than the type. For garden purposes the two kinds are quite distinct.

The value of *Pæonies*, both single and double, as cut flowers, has been well shown in Mr. Ware's stand of hardy flowers in the conservatory at the Colonial Exhibition; and also that of the single *Pyræthrums*, which are as useful for garden as for cut flower decoration. Arranged lightly with Ox-eye Daisies and golden *Doronicums* these bright red and pink flowers are peculiarly effective. Amongst the best are *Sherlock*, *Hamlet*, and a new deep crimson kind; *Mrs. Bateman Brown*.

Oenothera taurica flowers profusely planted on rockwork without any protection from damp, or other special treatment; but in parts of the country where the winter climate is less dry than in the neighbourhood of London the protection of a piece of glass, not close enough to exclude the air, would probably be of use. Nothing is better than part of a broken *clock*, as an unbroken cap-glass prevents sufficient circulation of air for plants requiring this very slight amount of protection, and the pieces of curved glass often fit on between stones in rockwork as no cap-glass can do. Probably at no time of year would a visit to the Hale Farm Nurseries be of greater interest than when the Lilies and later *Lilies* are in blossom. Large beds of *L. monadelphum* (*Colchicum*) and other choice *Lilies* must be a beautiful sight. But of all summer flowers none can surpass in beauty some of the *Lilies*, and yet in how many gardens but few kinds are grown, and those by no means always the best. They will probably make their way to a garden without a good selection of the better, for a garden without a good selection of *Lilies* has a pleasure lost. *I. pallida racemosa* and

I. pallida Celeste are hardly inferior in beauty, though smaller in size, to the exquisite *I. pallida* dalmatica; and they flower somewhat earlier—at the same time and so some of the earlier forms of the "variegata" and so called "germanica" sections. Amongst the latter early forms of Iris the pure white *I. albicans*, and a blue and white form, Madame Chereau, are of great beauty; *I. Gracchus*, *Victoire*, *Darius*, *Penelope*, *Queen of May*, and *Bridesmaid* are also beautiful, and no collection should be without the rather dwarf Iris *cingiatis*, a lovely blue kind, flowering two or three times in the season—a rare advantage amongst Irises, for though the Iris season may be made to last through a great part of the year, it must be by a careful selection of species, each of rather short duration. A little rock shrub as distinct as it is pretty, is *Helianthemum rosmarinifolium*, with small white flowers (a miniature "rock Rose") and dark green foliage, well described by its specific name; and if *Tamarisk* would always flower as freely as it does here it should be in every collection of shrubs. Its feathery foliage is always pretty, reminding one of some *Dacrydium*-like Conifer; but when covered with equally feathery wreaths of pale pink flowers it is still more effective. The bright yellow *Genista*-like flowers of *Thermopsis fabacea* var. *montana*, and the curious orange-buff colour of *Orobanchium aurantiacum* make them good additions to the hardy flower garden, as do the brilliant colours, yellow, white, and orange of the Iceland *Poppies* (*Papaver nudicaule*), and the many shades of *Ixias*, including the crimson *I. crateroides*.

Amongst June blue flowers, *Linum narbonneense*, *Tritelesia laxa*, *Pentstemon glaber* (with a shade of pink through it) and amongst pink flowers, *Lychnis viscaria* fl. splendens, and *Lychnis* (*Agrostema*) *Flo-Jovis*, are worth growing; and *Phlox ovata*, a dwarf, but not a trailing kind, is beautiful when grown in a mass. *Armeria cephalotes rubra*, and the pretty coral-red-flowered *Heuchera sanguinea* are grown here, and there is a large stock of *Androsace starnetosia*, also a stock of the silver-leaved *A. lanuginosa*. Even where the climate is too damp for the successful culture of Swiss *Androsaces* on rockwork, these two Indian kinds may be induced to grow well by the slight protection of a piece of glass to keep off rain, but not to exclude the air. Amongst these small rock plants the beautiful *Cyclobathra pulchella*, with its small yellow *Colochortus*-like flowers, is worthy of trial; and amongst bog plants there is a pretty kind of *Pinguicula*, called here *P. longifolia*, the blue flowers of which have a large white eye.

Gloxinia tuberosa (not yet in blossom) is of interest as a hardy plant belonging to a family almost all of which require stove or greenhouse treatment; and of still greater botanical interest are *Primula imperialis* and *Iris Robinsoniana*, outlying species of two great genera, both of which are absent from Australia, and both species being probably the nearest of any in their habitats to the Australian continent. *P. imperialis* has been found on one of the mountains in Java, though I think it has been introduced into this country from India; it is yellow, flowering in whorls like *P. japonica*, but as yet the plant does not seem to have attained its full size in cultivation. *Iris*, or rather *Diets*, *Robinsoniana* comes from Lord Howe's Island; it is one of the very few Irises from the southern hemisphere. It has been grown for many years at Kew, but has never flowered. It would be interesting to try this *Iris* in various positions under glass and in the open air in the milder parts of the country, so as, if possible, to induce it to blossom. Mr. Ware has a stock of it, and also of the New Zealand *Ranunculus Lyalli*, "Shepherds' Lily," which will probably succeed best when treated as a bog plant, but one whose hardness has not yet been proved; another good new plant is *Primula*, *Kusbyi*, from California, which appears to be perfectly hardy. *C. M. Owen*.

PLANT PORTRAITS.

ACONITUM BISSECTUM, *Gartenflora*, April, fig. 16.
ALOCASIA AUGUSTIANA, *Illustration Horticole*, t. 593.—A species with spotted petioles, and broad, cordate, ovate-acute leaves.

ANGRICUM CITRATUM, *Illustration Horticole*, t. 592.

STREPTOCARPUS, varieties of, *Garden*, May 22.

JESMOND DENE PARK.

ONE of the most charming wooded resorts in spring and summer about a township is the park given by Sir William Armstrong to the people of Newcastle, and bearing the name of Jesmond Dene. It is an oblong piece of ground, extending nearly a mile in length if you follow the winding walks sloping on both sides to a stream, not very pellicid certainly, and the amphitheatre-like form on both sides rising in undulating fashion, the acclivity on one side being particularly steep, especially for a flat country, and covered with large deciduous trees. The trees give a dignity to the groundwork, and form, when covered with leaves, an agreeable shade which screens the sun in its meridian glory, whilst the leaves fan the atmosphere, bringing pleasing sensations to the numerous promenaders. It was delightful to see on the fine Sunday afternoon that the writer visited this park the large number of well-dressed, well-behaved people taking advantage of the promenade, and admiring Nature in some of her most pleasing forms, without resorting to that species of Vandalism which townspeople are sometimes credited with. There was abundance of bloom of a kind, but it apparently was conserved the same, as each visitor took a delight in seeing it there for the benefit of his or her fellow-beings. This is as it ought to be. Unfortunately for the admirer of Nature, the trees and plants here, as in almost every other public park, are unnamed. This, if not a mistake, at least something remaining to be done. Most people like to know the names of trees they come in contact with, and sometimes inquire into their birth and parentage; and if it be applicable in the one case it is equally so in the other. In this age of progressive intelligence, when the Press has become so powerful an engine in promoting its growth and fostering a desire for increased information, the people who wander about public parks might easily acquire both the botanical and English name of most of the trees and plants that come before the eye if they were prominently labelled; and once acquired, it would create an additional zest and interest in reading about them in the various prints.

In this park the Plane forms a very conspicuous tree, although it is seldom met with doing well in the North; all along the glade it is met with in good sized examples. The Lime, the Horse Chestnut, the wild Cherry, the Beech, the Oak, the Ash, the Elder and the Thorn are equally at home; and whether we regard the columnar form of some of the species, or the wide-spreading branches of others, in regard to the variety of leaf form and the various tints, from a pale green to the young broozy tints of the expanding Sycamore, they present a beautiful feature in the landscape here. Most of those trees seem to have been planted about the beginning of the century, and are in no way injured by hostile smoke or other influences, the distance from the sites of factories being sufficient to insure their healthy growth.

The plants of lesser stature are conspicuous, more however, from their numbers than from their variety. In time, doubtless, this will be rectified; however, delightful to see "London Fride" by the 100,000 spikes growing in luxuriant wildness as a carpet plant under the shade of the trees, still a little less of it would be desirable. No doubt there are lots of Saxifrage and Stonecrops, and Periwinkles and Arabis and Sea Pinks and Primroses in many species and varieties, and in May or June they look charm-

ing with *Rhododendron ponticum*, *Azalea*, *Whin*, and *Heather*, springing up in a semi-natural-like state amongst them, but the eye longs for variety of both form and feature, and a little more in the way of both alpine and the larger herbaceous plants would be seen to great advantage in this beautiful natural dell. There is a bit of rocky shelving about the bridge at the "Old Mill," which is very enjoyable, where *Sedums* and *Saxifrage* and *Periwinkles* hang over, and among them spring Ferns of sorts, but not enough of them, an occasional *Rhododendron* and *Berberis* with the rigid *Cotoneaster* covering the boulders like a cap studded with multitudinous white flowers. This is one of the best looking rock plants to do duty on its own account in the whole of the Dene. When the entrance and exit lodges and gates have been put down and a little more variety has been introduced, this park will not only be appreciated by the Newcastle folks, but will be worthy of a visit from all those interested in parks and park scenery. *J. Anderson*.

TUBEROSES.

THE Colonies just now are in the ascendant, and we Britons are about as proud and self-conscious as any old hen and her chicks—and we have reason to be. In these days demonstration is everything. It does not do to read of the battle of Waterloo, that may have been true or not, but we did not see it. Captain Cook may have discovered that part of Australia known as Botany Bay, but we were not there to see him do it. Nevertheless the exhibits at South Kensington furnish proof sufficient even for an examiner, and so we trust the illustration we now give of *Tuberosa* growing in Natal (fig. 8), may afford satisfactory evidence, even to those who have not been there, that there is such a colony as Natal, and that the *Tuberosa* is grown there pretty extensively, furnishing employment to Europeans and to natives, and thus contributing not only to the luxuries of the "classes" at home, but supplying also a potent factor in the spread of civilisation among the masses, black as well as white.

Messrs. Edwards & Bell, of Pietermaritzburg—to whom we are indebted for the photograph whence our illustration was taken—tell us that they have under cultivation more than 12 acres of the "double South African *Tuberosa*," and which is grown chiefly for the London and the Paris markets. *Pollanthes tuberosa* was first mentioned by L'Escluse (Clusius) in 1594, and was probably originally introduced from Mexico. The name of *Pollanthes* is derived from *pollos*, white, and *anthos*, flower, and must not be confounded with *Polyanthus*—from *polios*, many, and *anthos*, flower—a term applied to umbellate *Primroses*.

NOTES ON SOME CHINESE ECONOMIC PLANTS.

RECENT contributions to the Kew Herbarium from various persons, and investigations in connection with the forthcoming *Index Floræ Sinesis*, have brought to light some interesting facts worthy of putting on record. Firstly, there is a small collection of dried specimens of economic plants from the western province of Szechuen, made and presented by F. S. A. Bourne, Esq., H. M. Consular Agent at Chungking or Chungking, the capital of the province in question. Mr. Bourne sends transliterations of the Chinese names and notes on the uses of the plants, which are given below in his own words.

BRASSICACEOUS PLANTS.

The specimens are not in all cases complete enough for absolute specific identification, which is almost impossible in the absence of ripe or nearly ripe fruit; but, together with their names and notes, collated with other sources of information, they are sufficient to show that they belong to two species, to which most of the various names given to Chinese Brassicaceous herbs are reducible. They are:—1. *Brassica campestris*, Linnaeus, syn. *B. chinensis*, Linnaeus; *Sinapis pekinensis*, Loureiro, and probably also *B. oleracea*, Lour.; 2. *Brassica juncea*, Hooker fil. and Thomson, syn. *Sinapis juncea*, Linn.; *S. chinensis*, Linn.; and *S. brassica*, Linn. There is a third cultivated species, *B. cernua*, Thunberg, but Mr. Bourne sends nothing that is referable to this. *Brassica violacea*, Linn., recorded from China, is an obscure

plant, of which no authentic specimen exists. Dr. F. Smith (*Contributions towards the Materia Medica and Natural History of China*, p. 197) states that both the white and black Mustards (*Brassica* and *B. nigra*) are cultivated in Chiao, and that the latter is indigenous, but his botany is often faulty. There are no Chinese specimens of either in the Kew Herbarium, and Bretschneider in his various works nowhere, that I can find, mentions Mustard. In fact, the Chinese names cited by Smith for the white and black Mustard respectively are given by Bretschneider (*Early Researches*, p. 137) to *Sinapis chinensis* and *S. brassicata*, varieties of *Brassica juucea*.

1. *Kao ts'ai* (*Brassica juucea* ?).—Seeds pressed for oil, of which immense quantities are used for light and cooking. Plant not eaten.

VARIOUS VEGETABLES.

6. *Tung kao ts'ai* (*Chrysanthemum segetum*).—Eaten when small.
7. *Ts'ai* (*Spinacea oleracea*).—Spinach cultivated.
8. *Wo sheng ts'ai* (*Lactuca scariola* var. ?).—A kind of Lettuce.
9. *Tung han ts'ai* (*Malva verticillata*).—Eaten when small in soup.
10. *Yen ts'ai* (*Coriandrum sativum*, ?).—Eaten as salad when young; good for a cold.
11. *Tien ts'ai* (*Beta vulgaris*).—Stalks and leaves eaten boiled.
12. *Ch'in ts'ai* (*Apium graveolens*).—Celery; stalks and leaves eaten fried.
13. *Ch'iao mzi* (*Fagopyrum esculentum*).—Buck-

remarkable strength and beauty. It seems to prefer rock. I have noticed in several cases that a loose shale or sandstone dipping at such an angle that the roots can push their way between the layers of strata, supports the finest trees. Such success excites the wonder, and often the worship of the villagers. When there is a bigger harvest than usual, the big tree gets the credit. There is one 13 miles to the south of Chungking, growing directly upon loose sandstone dipping at an angle of 85°, the branches of which have a radius of 16 yards. The largest branch has a circumference of 61 inches 4 feet from the trunk, whence it extends 18 yards at a height of only 8 feet above the ground. There are many larger trees. The peculiarity of this one is that the branches shoot out horizontally from the top of gigantic gnarled roots, so

FIG. 8.—TUBEROSE GROWING IN NATAL. (SEE P. 40)

2. *Pai ts'ai* (*Brassica campestris*).—When young plant eaten as Cabbage; cultivated also for its seeds, from which oil is pressed and used as above.

3. *Hung yu ts'ai* (*Brassica campestris* var.).—Cultivated for its seeds, from which an inferior oil is pressed, and used as above.

4. *Yu ts'ai* (*Brassica campestris* var.).—Cultivated for its seeds, from which a fragrant oil is pressed better than above qualities.

5. *Ch'ing ts'ai* (*Brassica juucea* var. ?).—This is peculiar to the province where it is cultivated in immense quantities, dried in the sun, pickled, and eaten with Rice. The French bishop here tells me that it is a cross between Cabbage and Mustard seeds sent. The seeds are sown here in October, with a maximum temperature of 78° Fahr., and a minimum temperature of 64° in the twenty-four hours. The plant is pulled in March.

wheat; two crops a year, in spring and autumn; cheaper than Wheat.

14. *La ts'ai* (*Brassica juucea* ?).—Young leaves eaten; flavour of Rhubarb.

15. *Han ts'ai* (*Amarantus gangeticus*).—Eaten as salad.

16. *Wing ts'ai* (*Ipomoea aquatica*).—Grows in moist ground; leaf and stalk eaten fried in oil.

17. *Ts'ing ming ts'ai* (*Anaphalis contorta*).—Eaten when tender (in April), boiled.

NOTABLE TREES.

Huang kuo shu (*Ficus infectoria*).—This is the tree about which travellers in Szechuen speak so often and not without reason. It is generally called Banyan, but it is surely not the true Banyan. Natives say that it grows nowhere but in this province. It is a tree of thin growth, but, where it finds a suitable habitat, of

that there is scarcely any trunk. Another specimen close to Chungking is 76 feet high, and has a radius of about 20 yards. The wood is soft, and of little value. It is an evergreen.

Ch'ing kang (*Quercus dentata* ?)—Charcoal made from the wood of this tree is used for smelting ore. The mountain silk-worm is fed on its leaves.

Kou shu (*Wickstroemia chamaeaphne* ?).—The bark of this plant affords an excellent paper-making fibre. The leaves are made into incense.

Sun tsao chin (*Litsea* sp.).—This specimen was taken from an evergreen tree about 20 feet high, of rounded appearance, bearing, the people said, white flowers. This is the only specimen I have seen.

DYE PLANTS.

In a small parcel of Chinese plants from Corea, chiefly such as are used in dyeing, lately sent to Kew

by W. R. Carles, Esq., there were specimens of "Tuyen tai," which is most likely the same as the *Tsin-ching* of Fortune (*Hwanising in China*, i., p. 234), a species of *Isatis*. Carles' plant is doubtless *Isatis tinctoria*, though Bretschneider (*Notes on Botanical Questions*, p. 8) asserts that it is not met with in China. It is true that Fortune gave his plant another name (*Journ. Hort Soc. Lond.*, i., p. 209, with a woodcut figure), *Isatis indigotica*; but it is not, so far as the figure and description go, different from the common European species, which is also found in North-west India.

Two other important Chinese dye-plants, namely, *Rhamnus chlorophorus* and *R. utilis*, of Decaisne, which yield the famous green indigo, or *vert de Chine*, I have lately had occasion to examine, with the result that I could not distinguish them from previously described species. A great deal has been written concerning these two shrubs, including a very elaborate work of 200 pages, by Koudot, with beautiful figures of the plants by Kiocieux, and specimens of silk dyed with *vert de Chine*. This book was published under the auspices of the Lyons Chamber of Commerce. After a careful comparison of all the Chinese species of *Rhamnus* I have reduced *R. utilis* of Decaisne to *R. davuricus* of Pallas; and Maximowicz treats the latter as a variety of *R. catharticus* of Linnaeus; but as it is distinguishable and already possesses a name, I have preferred retaining it as an independent species, though it cannot be denied that it is very closely allied to *R. catharticus*. Authentic specimens of *R. davuricus* and of *R. utilis* are so exactly alike that there can be no question of their specific identity. I should add that *R. davuricus*, as extended by Lawson in Hooker's *Flora of British India*, i., p. 639, is a very heterogeneous species, which few botanists, I imagine, will accept.

Turning to the second species of *Rhamnus* which yields the dye (*R. chlorophorus*, Decaisne), I cannot in any way distinguish it from the European *R. tinctoria*. Almost exact counterparts of authentic *R. chlorophorus*, Dene., and of *R. globosus*, Bunge, another reputed Chinese species, are to be found among the European specimens of *R. tinctoria* in the Kew Herbarium. Of course this is only one of many instances of European plants recurring in China, though apparently absent from a vast intermediate area. In this connection I may mention that the remarkably distinct Caucasian *Euonymus nanus*, a species that is in cultivation at Kew, has comparatively recently been collected in Turkestan, Mongolia, and in the mountains of Kansuh, Western China, at an elevation of 7500 feet.

Besides the two species of *Rhamnus*, *R. davuricus* and *R. tinctoria*, at least one other is employed in China for dyeing purposes. In the Kew Herbarium is a specimen of a species destitute of both flowers and fruit, though undoubtedly a *Rhamnus*, collected by Mesny about 10 miles north of Kwei-yang, in the province of Szechuen, at an elevation of 6500 feet. It is quite distinct from all the other Chinese species, and apparently an evergreen. A note by Mesny accompanies the specimen, to the effect that it is used with other ingredients to make a green dye for calico; its own liquor being blue like indigo. *W. Botting Hemley*.

The Apiary.

INCREASE OF COLONIES.

I PROMISED in my last article to say a little more about the artificial swarming this time. It should ever be the object of the beekeeper to keep all colonies strong, and therefore artificial swarming and increase of colonies must be practised with care and judgment. If a colony of bees is too much weakened by swarming, whether natural or artificial, that colony will not produce any surplus honey during the remainder of the season. A very nice way of making an artificial swarm is that practised by Mr. G. W. House, a famous beekeeper on the other side of the herring-bone. It is as follows:—Take an empty hive filled with frames of comb foundation, and a broad frame with section boxes on each side of the brood-chamber, and place the hive where you wish it to remain. Now take out one of the frames of foundation and go to a colony and exchange it for a frame of brood and the adhering bees; put this frame of brood and bees in

the new hive. Now go to another colony, and exchange a frame of foundation for a frame of brood and bees, as before; and proceed thus until you have the new hive full of frames containing brood and the adhering bees. By the time you have done this, any older bees will have returned to their own homes, and the younger bees will be in such a perplexed and demoralised state that they will accept any queen you choose to give them. You have only to place your queen on the top of the combs, and she will run down between them at once and be accepted. If you have not a spare queen but have a ripe queen cell to spare, you can insert that instead, but a queen is better, as valuable time is saved, and a good beekeeper will mostly have on hand a spare queen. When all this is done carefully put on the top surplus arrangement, and all is done. You will then have a colony fit to start business at once, and ready to take advantage of the weather and bring in stores of honey. Thus, you can get a colony of bees without injuring the others one iota. These things must not now be delayed if you intend doing them this season. Honey is at last coming in fast, and therefore take every means to keep the bees well employed. When supers are about half or three parts filled it is a good thing to raise them and put others under. By this means the bees are stimulated to the utmost, and you will find the bottom super filled almost as soon as the top. This is always a good principle to work upon, as the bees will not have to trample so much upon the finished honeycomb, but can continually go on completing their work downwards. If the weather continues warm you can put a third and even a fourth on, but always under. *Walter Chitty, Peasey*.

THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.

THE Thirty-third anniversary festival of the Gardeners' Royal Benevolent Institution was held on Friday night, the 2d inst., at "The Albion," Aldersgate Street. Mr. N. N. Sherwood presided, and there was a numerous company, including Lord Crewe, Baron Schröder, Sir Trevor Lawrence (President of the Royal Horticultural Society), Major Lambert, Herbert Adams, Esq.; Ed. Tidswell, E. G. Treasurer; several colonial representatives, the Mayor of Chester, John Lee, Esq., the father of the Institution; E. S. Williams, Hugh Low, C. Fisher, H. E. Milner, P. Barr, and many others—in all about 150. The tables were elegantly decorated with flowers and plants, sent by Messrs. Cutshub, Veitch, Laing, Paul & Son, Low, &c.

THE CHAIRMAN, in giving the toast of the evening—"The Gardeners' Royal Benevolent Institution, long may it flourish"—said that if English colour and language was proverbial in like manner English charity had no parallel. In no other country were there such magnificent institutions supported by voluntary contributions; and the same way of generosity to poor and needy, irrespective of creed or nationality, bestowed with a more lavish hand than in England. It was in the year 1838 that a few charitably disposed gentlemen conceived the most laudable idea of starting the Gardeners' Benevolent Institution with the object of helping poor and distressed gardeners in their old age. For four years the Society did not prosper; but in the year 1844, on the election of their present Secretary, matters began to look up and the proceeds of the anniversary dinner in 1845 amounted to £20. Since that time the Society had progressed, and he was happy to tell them that their income now amounted to over £2000 a year. They had funded the sum of £21,000. They had 148 pensioners on the lists, the men receiving £20 per annum, and the women £10 per annum. Since the Society was formed they had helped 552 persons, at a cost of over £13,000. Those figures spoke for themselves. They must not, however, relax their efforts, for they had increasing demands upon their resources. When he told them that there were in England 21,000 gardeners they might imagine to what a degree of usefulness the Society might be carried. Need he refer upon the special claims which the Society had upon their sympathy and support? Bountiful Nature had stored this earth of ours with lovely flowers in countless variety and profusion, with luscious fruits and health-giving vegetables, but it was to our gardeners that we looked by their care, zeal, and attention to bring them to perfection. They were aware how arduous were the duties of a gardener—in all weathers, all climates and all seasons, he was at work early and late, and from the nature of his duties, through exposure to climatic changes, he was liable to infirmities which incapacitated him from gaining his daily living; and besides that he was not too highly remunerated. The £21,000 reserve fund, which he had spoken produced only a small sum towards their annual expenditure, and, moreover, it was a nest-egg which they did not want to touch, but which they wanted to keep for a

"rainy day." They had, therefore, to rely upon donations and subscriptions for their revenue. He was happy to say that the donors were so liberal, and he might inform them that a gentleman in the room who had written to many of the gardeners had received satisfactory replies from 171 gentlemen's gardeners. He could not too strongly recommend the Society to the support of the gardeners themselves, and he hoped that gentlemen who employed them would impress upon them the urgency and importance of belonging to the Society, which above all things taught the grand lessons of self-help, thrift, and providence. One of their rules could not too strongly be insisted upon, and he provided that any subscriber of 1 guinea or a lump sum who had been on the books of the Society for fifteen years, or any subscriber of 1 guinea per annum for fifteen years was eligible for the benefit of the pension list without a monetary point of view. It was a good investment. He might be told by some that they were not likely ever to want the aid of the Society. He could only reply that there were on the list men who had been in affluent circumstances, and who were now glad to receive the aid which the Society gave them. Moreover, if those who subscribed did not want to help themselves, it ought certainly to help others. He ventured to suggest that many of them who had children fond of gardens would enter them on the list as subscribers, and let them share in their own good fortune. He had been in a similar situation. Many generous donations had been made that evening, and he besought them all to give their support to the Society. Let them in the kindness of their hearts make the forty-third anniversary dinner one of the greatest of their lives, and he hoped that they would ever have it. He coupled with the toast the name of the father of the Institution—Mr. John Lee.

MR. JOHN LEE, in responding, said he had certainly been connected with the Institution from its origin, but he could hardly claim to have been the originator of it. Owing to the exertions of others he had been put forward during the last few years they had been enabled to increase the amount of the annual pensions, and the Institution was now in a very flourishing condition. This was greatly owing to their Secretary, who was about the best manager in the world. The committee also had acted on the plan of preserving the funds entrusted to their care, so that no institution in London has been managed with more economy than the Gardeners' Benevolent Institution. He had been a member of the Institution in a miserable condition, and they had just sufficient to pay the ordinary pension, and the expenses of the Institution for one year. Now they had 148 pensioners, and granted £20 a year for 148, and £10 a year for females. While the Institution was always in debt, the Gardeners' Benevolent Institution had funded every legacy left to them and every life donation. In that way they had built up a noble fund, which they could fall back upon in case of need.

MR. J. R. BARRETT proposed the President, Vice-Presidents, and Treasurer of the Institution, coupling with the toast the names of Baron Schröder and E. S. Williams, who briefly replied. The latter gentleman expressed his hearty thanks to those who had contributed to the decorations of the tables and the room. The decorations were all made by the delicate fingers of Miss Williams, and gifts of flowers had been sent by Messrs. William Cutshub, Veitch, Laing, Paul & Son, and Low. This annual festival was unique in this respect, and in its fruit and floral display he believed it was the best dinner throughout the whole of the London season.

MAJOR LAMBERT, in proposing "The Chairman," said they had made an excellent choice in appointing Mr. Sherwood their Chairman. Mr. Sherwood had expressed the hope that they might on that occasion raise the sum of £1000. He hoped they would show their appreciation of Mr. Sherwood's services in the chair by subscribing liberally, and helping their Chairman to obtain the largest subscription that had ever been made, at this their forty-third anniversary.

THE CHAIRMAN, in acknowledging the toast, said he had now to ask them to think of the health of a gentleman who had been connected with the Institution ever since its foundation—Mr. Cutler, their Secretary. If ever there was a pattern secretary, and who took a genuine interest in a society, it was Mr. Cutler. He hoped that they would make Mr. Cutler happy by making good the promise which he had made.

MR. CUTLER, the Secretary, then said—Gentlemen, for the forty-third time I beg to make my annual bow, and to report to you the result of this evening's proceedings. My forty-third year ago we held our first festival. I remember it well; it was one of a gold, and I was in January, and it took place in a most dingy and ugly place in the Strand—the late "Crown and Anchor," famous for Radical meetings and balls of questionable reputation. We collected somewhere between £40 and £50, and thought that was a good deal. We had about forty or fifty people present, and out of that number I think only three are alive, and I am pleased to say they are in the room at this moment—Mr. John Lee, Major Tolson, and your humble servant. However, since that time we have steadily progressed—not so fast as I should like, but still we have progressed and we have never retrograded. Now, Mr. Chairman and gentlemen, you will be pleased to hear that the result of our proceedings is the largest amount ever yet received at any anniversary of the Gardeners' Benevolent Institution amounts to £570, including £100 in the gift, and to show that he practices what he preaches, he has put down the sum of £21 for each of his three children—Baron Schröder has given us £25 5s.; Sir Trevor Lawrence, £25 5s.; Major Geo. Lambert, £21 10s.; Mr.

Harry Veitch has collected the sum of £3,300, out of which the Royal Horticultural Society has about £1,000. Our good friend, G. A. Dickson, Esq., Mayor of Chester, has come up specially to attend this festival, and has brought from his locality the sum of £100. Mr. Tait (Dickson, Brown & Tait), of Manchester, has sent up the sum of £74; Mr. C. Fisher, of Sheffield, has sent up the sum of £68; Mr. Williams, of Holloway, has brought the sum of £55; these amounts make up a grand total of £4,130, and I have reason to think there is more to follow. Gentlemen, on behalf of the recipients of your bounty, beg to thank you, and I am sure that none of you will sleep any the worse to-night for the valuable aid you have rendered to the Institution. Now, what can I say as regards myself? Nothing but an olden-told tale. Gentlemen, I thank you very much for the honour you have again conferred upon me, and I trust that in the few years I may have yet to live to retain the good opinion which I have good reason to believe you entertain for me. Again, I beg respectfully to thank you.

Mr. J. J. ADAMS gave the "Horticultural and Botanical Societies of England."

Sir TREVOR LAWRENCE responded. He ventured to suggest that they should get the President of the Royal Horticultural Society to occupy the chair at one of the annual dinners, and if they could get the Duke of Westminster to make the opening address, that would be to the advantage of the Institution. With regard to the Royal Horticultural Society, he admitted there was one thing it might have done and which it had not done. It might have interested itself a little more in the education of young gardeners. He should like to tell you that the prizes which were given by the *Gardeners' Chronicle* for an essay on scientific points in connection with practical horticulture, the second prize was gained by a young man on the staff of the Horticultural Society at Chiswick. When he heard how large a measure of support was given to institutions and schools for the education of young gardeners abroad he thought to himself that we had a great deal to learn from foreign countries. We were a little disposed in this country to think that we were the centre of the universe, and that the whole of the foreign countries circled around us as we do round the sun, but the longer we lived the less reason we found to consider this to be true. Certainly with regard to this matter of the education of young gardeners we were very far behind other countries. It was only lately that we had become keenly alive to the necessity of having a more practical system of technical education, and if technical education were necessary in anything certainly it was necessary in gardening.

Sir TREVOR LAWRENCE proposed "The Nursery and Seed Trade—the Parents of the Institution." He said that that Institution was so deeply indebted to the seed trade and to the nursery trade that the toast was certainly appropriate on that occasion. It might be that they had thought of the exploitation of the seed trade, but to continue its generous support to the Institution during the depression of trade, for those trades connected with gardening had suffered perhaps as much as any. Seeing, however, how few had been the failures in those trades, and how generous they had continued in their support of the Institution, it did seem that the state of the nursery and seed trades was fairly sound. One reason for it was, that members of those trades did not very much despise one another. They had learned that unity is strength. Customers were always increasing in number, and the trade continued to produce for itself, therefore one might reasonably suppose that the seed and nursery trades would continue to prosper in the future.

The MAYOR OF CHESTER briefly acknowledged the compliment.

Mr. CHURMAN proposed "The Stewards and Committee of Management," which was responded to by Mr. Williams, and the proceedings terminated.

Orchid Notes and Gleanings.

BRASSAVOLA DIGBYANA.

The earlier cultivators of this noble species grew it on a bark suspended near the glass, where it proved of exceedingly slow growth. It may possess this character under any condition, but its bold and telling appearance should insure its introduction to every collection. A fine mass of it flowers annually in the garden of Sir George Macleay at Pendell Court, where it is grown in a large well drained pot in a mixture of lumpy fibrous peat and sphagnum. Its fragrance, especially at night, pervades the whole house in which it is grown. The sepals and petals may be described as a pale green white, of great endurance, and fading with age; they measure at least 5 to 6 inches across the tips, but are altogether eclipsed by the great lacerated white labellum. The fineness and extraordinary length of the fringes constitutes the most conspicuous feature of the labellum, which also possesses near the base a curiously elevated process, doubtless concerned in, or lending material assistance in bringing about fertilisation. This process is well shown in the *Botanical Magazine*, t. 4474. The pseudobulbs and the oblong, solitary, rigid terminal leaf presents the appearance of a Cattleya or

Laelia, to the latter of which the *Genera Plantarum*, however, considers it should belong. The sepals and petals are nearly of the same width, while the labellum is abruptly dilated and hooded, depriving it of the tubular appearance of the labellum of a Laelia. A stronger character, however, is derived from the enormously elongated beak of the ovary. The beak and ovary measure at flowering time 7 inches in length; the former curves over the end of the large spathe, bringing the flower into a horizontal position. The peduncle and pedicel only measure about an inch, therefore, the distinct pseudobulbs and terminal flat leaf are the strongest characters that militate against its retention in the genus *Dravassola*. *J. F.*

ONCIDIUM TETRACOHIS, Rehb. f.

All the flowers I had seen from Messrs. W. Bull, Farmer Hall, and Lemon, had brown wings to the column. Mr. A. Wilson, Westbrook, Sheffield, sends me the same species with yellow wings, adorned with a few purple lines and streaks. A most welcome sketch of the whole plant gives evidence that the pseudobulbs stand close together, so that our plant may be easier of management than those species with straggling stems and distant pseudobulbs. *H. C. Rehb. f.*

HOYA IMPERIALIS.

Of all the cultivated species of *Hoya* the present is deservedly entitled to the high-sounding title it receives. The fragrant flowers are between 2 and 3 inches in diameter, of great substance and rigidity. They are produced on the young wood in extra-axillary umbels of nine to fourteen flowers each. Occasionally they are terminal or subterminal on the young wood, but more frequently on the space between two leaves, with the peduncle becoming separate from the branch at a point on a level with the petioles of two opposite leaves, or nearly so. The umbel is large, although the flowers composing it are few comparatively with that of many other species owing to the great size of the individual flowers. The staminal corona is large, prominent, and white, contrary to the general rule in most of the more generally cultivated species, where it forms the most conspicuous and attractive object of the flower. The corolla is described in the *Botanical Magazine*, t. 4397, as deep rose without, and pale rose within, fading to white, but this description neither agrees with the coloured plate nor with that of the living plant itself. Externally it may be described as a pale dusky yellow, and deep brownish internally, fading to a yellowish-white before it drops away. When seen in prime condition the corolla is of great substance, and shines with a waxy lustre. The oblong-ovate or oblong, leathery, opposite leaves are of great size. There is a plant in the unique and most interesting collection at Pendell Court, where it is trained under a raffia-cloth to the glass in the tropical Water Lily-house, and has been flowering for a considerable time. *J. F.*

THE SYDNEY GARDENS, BATH.

For years past Bath has been famous for its gardens, and in the time of Beau Nash the chief of these were the Spring Gardens; others of scarcely less importance were the Villa Gardens, King James' Palace and the Bagatelle Gardens; and to these were subsequently added the Grosvenor Gardens. At that time Spring Gardens "were practically in the country, and though the approach to them was repelling, they afforded from their airiness a pleasant contrast to the stuffy, narrow streets of the city. With their grottos, arbours, and statuary, greenward, and gay parterres, music, and games, they supplied the charm of variety, and ministered to the enjoyment of the patrons."

The pleasure gardens pastimes of those days are worthy notice. A writer in one of the Bath papers, writing on Bath in the eighteenth century, says:—"Imagine the leaux and bellies of our crescents and squares rising with the lark, and after a visit to the baths or pump-room, going to a public garden to breakfast, and to dance or to witness some novel diversions." Yet this was for many years a keenly relished feature in the fashionable programme of the past century. It was even customary with persons of rank and fortune to invite their friends to "concert breakfasts" at the public places in question, and to participate in the stately minuets or cotillions. In those days fashionable society must have retired to rest much earlier than in these latter

days if they rose with the lark. "Every Monday and Thursday a public breakfast took place to the sound of 'French horns and clarionets.' The triffl was, it seems, moderate, the tickets being 1s. 6d. each, while 'private breakfasts without music' were charged only 1s. Ladies and gentlemen likewise met there in the evening to drink tea. The charges, it will be seen, were sufficiently low to tempt even the frugal mind. A specially advertised were the 'Spring Garden cakes and rolls,' which were ready 'every morning from early after nine.' That our forefathers were thus prompt 'to brush with hasty steps the dew away' may cause surprise, but then Nash's rules cultivated 'the early to bed' maxim. The balls began at 6 o'clock and closed at 11, even in the middle of a dance, if one was going forward. Nor would he suffer them, not even to please royalty, to continue a moment longer, believing it to be injurious to invalids, and therefore bad for the reputation of the waters."

How great a gulf separates the nineteenth from the seventeenth century is curiously illustrated by one of the municipal laws enacted in the latter. It is as follows:—"That no person, after he had been chosen mayor of the said city (Bath) should wear any nobleman's or gentleman's livery without the leave and licence of the mayor and aldermen, under the penalty of £10 to the use of the poor of the said city for every offence." In those days it was apparently a custom for the chief magistrate to borrow a suit from some lucky who came in the retinue of the more distinguished visitors, in order to show proper deference to his master. Spring Gardens continued one of the haunts of fashion until the building of Laura Place and adjacent houses having encroached on the area, it was thought expedient to lay out fresh grounds on an improved scale, which led to the establishment of the Sydney Gardens, and the eventual closing of Spring Gardens.

The beautiful sylvan grounds known as Sydney Gardens are at the termination of Paltney Street. They were at first called "Sydney Gardens, Vauxhall." They were designed by Mr. Hircourt Master, architect, and were opened on May 11, 1795. Though not large in size, they are laid out with great taste; they are studded with stately trees, which afford grateful shade during the summer heat. Formerly they included a hotel, which was described as "elegant and spacious, and conducted with great spirit and liberality; swings, bowling greens, and a Merlin swing in the labyrinth were included in its games; grottoes and alcoves, formed with much taste, also afforded cosy nooks. During the summer there were public nights with music, fireworks, and superb illuminations." Surrounding the gardens was a ris for the accommodation of ladies and gentlemen on horseback, the terms being 2s. 6d. for one month, 5s. for three months, and 15s. a year; non-subscribers, 6d. each time. This combination of advantages failed to make either the hotel or the gardens permanently successful; both have undergone sunny vicissitudes. The building is now a branch of the Bath College; the ride and the grotto have disappeared, and private dwellings have encroached on the ground once open to the public. Nevertheless, the gardens, though curtailed and changed, are still beautiful, and devoted as they are now chiefly to music and flower shows, furnish enjoyment and recreation to all classes of citizens." The Great Western Railway passes through the grounds by means of a deep cutting, but the changes thereby effected, improved rather than otherwise their appearance, giving additional walks, bridges, and grassy slopes, while the passage of the trains is by no means of a disagreeable character. The Kennet and Avon Canal also traverses the gardens parallel with the railway. An elegant orchestra has been erected for the use of the City Band, a gymnasium is also provided for the young; and there are likewise facilities for croquet, archery and lawn tennis; so that the gardens are now adapted to meet modern requirements.

The Sydney Gardens now belong to a body of proprietors who lease them to the Floral and Band Committee. This body maintains them for the purpose of holding their band performances and floral exhibitions. The committee consists of some sixty of the leading tradesmen of the city, who canvass the whole of the town and district annually, for the sale of tickets. A first-class band is provided, the maintenance of which costs about £50 per week, and which performs from May until September, both in the Sydney Gardens and also in Victoria Park. A yearly subscription of 5s. admits one person through-

out the season to the band performances, and also entitles the subscriber to one ticket of the nominal value of half a crown, to admission at 2 o'clock to the spring *fête* in May, and to the autumnal show in September, and additional tickets to the three other shows at a cost of 1s. each—a show of bulbs and spring flowers in March, a Rose show in July, and a Chrysanthemum show in November.

How large a financial responsibility is undertaken by the committee is seen when it is stated that last year's undertakings involved an expenditure of £324 11s., and there was a loss of £50 on the year, owing to bad weather, which involved an encroachment upon a moderate reserve fund started a year or two since. But the committee is looked upon as one of the public institutions of Bath, and its work is on no account allowed to drop. The management of the gardens, &c., is accomplished by means of sub-committees, as one for the carrying out of the floral *fêtes*, one for the band, another for the gardens, &c. Altogether the Society appears to stand almost unique of its kind, for the large amount of entertainment and enjoyment it gives for so small an outlay. And in so far as the operations of the committee give an impetus to horticultural enterprise it is doing as much as any city or town in the kingdom. There is a strong floral committee, and during the last four years the Rose, Chrysanthemum, and bulb shows have been added, making, as already stated, five in one year. The present secretary to the committee, Mr. Benjamin Pearson, has occupied this position for a number of years past. *R. D.*

OLEARIA NITIDA.

THE above-named shrub (fig. 10) came to me from a garden of a friend living on the borders of the counties of Clare and Galway, who did not know its name, so when in the first year of its existence it bloomed profusely in the cutting bed, I sent a specimen to the Herbarium at Kew, where Mr. Baker kindly named it for me. It is perfectly hardy here, and is of a neat and compact habit of growth. *W. E. Gumbleton.* [The shrub, of which we owe the opportunity of illustrating to the kindness of Mr. Gumbleton, is described by Sir Joseph Hooker in the *Handbook of the New Zealand Flora*, p. 125 (1867) in the following terms:—"A small tree, resembling *O. furfuracea*, but the tomentum is more silvery and shining, and the leaves more ovate, less coriaceous, sinuate-toothed, and acute or acuminate. Heads in close, many-flowered, rounded corymbs, on silky pedicels $\frac{1}{2}$ – $\frac{3}{4}$ inch long, about as broad; involucre scales few, pilose or laxly villous; florets, 15–20, rays short. Pappus unequal. Achene silky. Eurybia alpina, Lindl. et Paxt. *Mag.* . . ." Mountains of northern island, abundant throughout the middle island.]

ROUND LIVERPOOL.

(Continued from p. 11.)

BIRCHFIELD, FALLOWFIELD, NEAR MANCHESTER, THE RESIDENCE OF A. IRINE, ESQ.—This place is about two miles from Manchester, from which tram cars run past the gates every ten or fifteen minutes during the day. Here a good collection of Orchids has been formed in very little time, and what is more, they are in beautiful condition. *Vandas* occupy one-half of a good-sized house; they include most of the leading varieties of *V. tricolor*, *V. saavis*, and others, beautiful plants, furnished down to the pots with stout healthy leaves, that show the treatment they receive to be right. *Cattleyas* are represented by quantities of the favourite kinds, such as *C. Mendelii*, *C. gigas*, *C. Dowiana*, *C. Trianae*, *C. Skinneri*, and *C. Mossiae*, in their varied forms. Many of the plants are large masses, that have been imported within the last two years, and are in beautiful condition; some of them are from 3 to 3½ feet in diameter. *Lælias* of the various favourite kinds thrive equally well, the bulbs and leaves in many cases as short and stout as when imported. *Dendrobiums*, such as *D. Wardianum*, *D. crassinode*, *D. devonianum*, *D. densiflorum*, *D. thysiflorum*, and the longer bulbous species, such as *D. fimbriatum*, are as vigorous as they well could be.

The warmer section of the East Indian species, such as *Aerides*, *Saccolabiums*, and *Cypripediums*, show by their condition that the treatment they get suits them. The cool kinds, comprising *Odontoglossums*, *Masdevallias*, and others that require a like temperature thrive as well as could be desired. Plants of *O. crispum* that have been imported three

years have made progress such as usually requires more time to effect.

The remark is often made that it seldom happens that the different sections of Orchids that respectively require warm, intermediate and cool treatment are all done well at the same place, but Mr. Cragg, the gardener here, seems to be successful with all.

WOOD LAWN, DIDSBURY, NEAR MANCHESTER, THE RESIDENCE OF J. BROOME, ESQ.

This place is about 3 miles from the Manchester Exchange, from which the trams run frequently. Plants of various sorts are well represented here; a nice collection of specimen hardwooded stove and greenhouse kinds, including *Azaleas* and *Heaths*, are well grown. Fine-leaved plants are likewise present in considerable numbers and in good condition. Pitcher plants are a leading feature, they include both *Sarracenias* and *Nepenthes*; of the latter—though too early in the season to see them at their best—there is a number of fine specimens, amongst which may be named *N. bicolorata*, bearing sixteen of its singular pitchers; *N. Mastersiana*, two forms quite distinct in appearance, but both fine; *N. sanguinea*, still very rare, and one of the best; *N. Proomeana*, which may be described as something in shape between *N. Rafinesiana* and *N. Hookeriana*: the ground colour is pale green, the marking which covers much of the surface is nearly black. *Sarracenias* comprise all the leading kinds, of which may be mentioned *S. Drummondii*, several forms of *S. flava*, including *S. flava maxima*, which is one of the finest;

FIG. 9.—CŒLOGYNE DAYANA.

S. Chelsoni × *S. Mitchelliana* × *S. Tolliana* × *S. Swanniana*, *S. ornata* × *S. illustrata*, and *S. Madisoniana* × *Mr. A. Cole*, Mr. Broome's gardener, is successful with these, as he appears to be with whatever class of plants he takes in hand.

There is an interesting collection of *Sonerillas*, comprising nine or ten kinds of these beautifully marked small-leaved plants. A small house is filled with filmy Ferns, which are in good condition and very interesting.

Amongst Orchids are several noteworthy specimens, *Vanda* *teres Andersoniana* in particular, a plant of which had over fifty spikes, carrying 240 of its singularly beautiful flowers coming on. This specimen alone is worth going some distance to see.

CŒLOGYNE DAYANA.

THIS seems to have become as great a favourite as *C. Massangeana*, which it somewhat resembles in habit; its pseudo bulbs however are long and slender, and the leaves of a darker green. The flowers of *C. Dayana* are produced on long drooping scapes, each bearing from twenty to thirty blooms, the sepals and petals are light yellow shaded with a bronzy tint, lip yellow and white on the inner surface, the side lobes being evenly marked as with a grainer's comb. The plant should be grown in a basket and suspended in a *Cattleya*-house, in which position it shows to advantage its elegant inflorescence. *C. Dayana* was received from Borneo by Messrs. Jas. Veitch & Sons, of Chelsea, who flowered it about two years ago and forthwith distributed it. Our illustration (fig. 9) was taken from a flower off a grand spray which was produced on Baron Schröder's plant this year.

Notices of Books.

Handbuch der Pflanzenkrankheiten. (Manual of Plant Diseases.) Von Dr. Paul Sorauer. Berlin: Paul Parey, 1886.

In these days of depression in agriculture, and of close competition in all horticultural work, a good book on plant-diseases is an undoubted boon to all growers of plants, and one which no wise gardener or farmer can afford to reject. Dr. Sorauer's book is written in German and therefore is inaccessible to many readers in this country; but its lessons are sure to reach indirectly all who are seriously interested in its subject. No worthy book is altogether sealed to the earnest student, since it influences all contemporary work of the like kind; and if I may say so in these pages few better services have been done to lovers of plants than the accounts of researches on plant diseases published in these columns and associated with the names of the Rev. Mr. Berkeley, Mr. Worthington Smith, Mr. Plowright, and others. These are happily for the most part original, but all more or less influenced by and full of criticism of such work as Sorauer's book contains. A notice of it here, therefore, is in its right place. This second edition, as it is called, is virtually a new book. The first edition, published in 1874, is a book of 406 pages, while the first volume, now published, of the present edition, dealing with non-parasitic diseases only, contains no fewer than 920 pages. This comparison gives a rough but striking idea, not only of the enlargement of the book but of the progress of the subject, of which it is a fair index—with the reservation, however, that the present edition is a better book for its time than the first one was. Since the publication of the first edition research has been very busy, and the life-histories of many disease organisms have been traced; and not only this, but Frank's admirable *Krankheiten* has appeared in the interval, and has largely contributed to the making of this book possible in its present form. Frank's book showed the extent of the field, and to cover it comprehensively Dr. Sorauer has undertaken a reconstruction of his former work, and has done it, it may be said at once, with great care and fulness. He has gone independently to the original sources of information, has brought the treatment of it up to date by incorporating the results of recent research, and has written the book in a style of his own. It appeals not only to the scientific man but to the intelligent planter-grower, for whose benefit the author frequently goes out of his way, as it were, to make clear such portions of his subjects as, usually treated, demand a knowledge of plant anatomy for their proper appreciation. As he happily says, "the practical farmer has no more need to be a plant-pathologist than he has to be a veterinary surgeon," but all the same he has need of such knowledge as shall enable him, in case of sudden need, to deal with outbreaks of disease, and to guide him towards its prevention. The author proposes shortly to issue an "Atlas of Plant Diseases," with the object of rendering familiar to a wide class the appearance of specific diseases. Such an atlas, were each plate of it accompanied by concise and clear directions as to the treatment of the disease, would be by far the best form of literature for the purposes of the plant-grower. Assuredly, too, in these times, when one hears of the "inherent epidemic" of certain plants being responsible for epidemics, there is great need of a lucid explanation of those causes which favour the spread of diseases. More light is needed on the questions which arise as to the effects of the cultivation on crops. The fact that the growing together of vast numbers of plants of the same species encourages the spread of parasitic disease, is often explained by the statement, that the plants in question are in some way (more or less mysterious) weakened by the unnatural habit (if the plant be not gregarious in a wild state), and thus rendered more susceptible to disease. Whether there is anything in this speculation some one may in time try to find out (and there may be something in it), but surely the simple explanation, that when plants grow close together the spread of infection is a very easy matter, lies nearer at hand than the other. That this is the case among wild plants growing together is a familiar fact. Almost every one has observed, for example, that when white rust (*Cystopus candidus*) once attacks a patch of Shepherd's Purse, very few plants of that patch escape. Of far

greater interest, however, is the inquiry into the nature of the disease-resisting powers of races, and the alleged gradual loss of such power. Such questions are touched upon by Dr. Sorauer in his interesting preface, and perhaps he does not touch upon them very cautiously in all cases. The whole question of predisposition to disease requires very careful handling, and enquiry can hardly take a more fruitful direction than the precise causes of predisposition. At all events, it is important for the grower to know that a susceptible state need not be in itself an unhealthy state—that it probably—nearly always—is but a normal phase in the development of the plant.

The present volume is devoted to the non-parasitic diseases, and after a short introduction the author

dealt with at great length—wounds of the axis, wounds of foliage, of fruits, and of seeds, and the reparative processes in plant tissues. Chapter V. is a short one on the various knot formations, which are, however, very fully treated of. The subject of Chapter VI. is galls, and it is discussed in great detail; the galls formed by Coleoptera, Lepidoptera, Hymenoptera, Diptera, Orthoptera, Hemiptera, Acarina, worms and Rotatoria being each dealt with in succession. The abnormal production of gum, resin, and the like, is the subject of Chapter VII., and the last (Chapter VIII.) is devoted to weeds. There are three indexes to the book, one of gall-bearing plants, one of the other plants, and one of subjects, which is a pity, since a good general index is much to be preferred.

Gardens of Light and Shade. By G. S. C. Elliot Stock.

In such a matter as ornamental gardening there is room for the greatest diversities of taste, but there should be no prejudice. Our author is apparently no botanist, and has little love or care for plants as such. So much the worse for him; he misses the main charm and interest of a garden—its life. Still, for all that, he and those like him may and do extract a vast deal of pleasure from a garden, looked at from their point of view only; and in considering his book, we have, of course, to look at it from his point of view. He is a thorough admirer of the picturesque style of gardening, and he upholds Nature as the model for the gardener to follow. No one will gainsay such a truism, no one questions the validity of the oracle, it is the interpretation of it that leads to diversity of opinion. Nature teaches us that the highest, the most satisfying sort of beauty is that styled the beauty of appropriateness, or fitness for purpose, suitability to circumstances, and harmony with surroundings. When these are secured there is for those who can read it a consistent history—a lesson in adaptation. The natural style of gardening is unquestionably in the abstract the most beautiful and the most agreeable, but in practice it must be modified more or less according to the size of the garden, its situation, the nature of its surroundings, and the purpose for which it is required. A garden is by its very nature to some extent artificial; if it were not so it would not be a garden. To conceal the art that made it what it is often demands the exercise of the finest taste, but there are cases where any attempts to conceal the formality and art employed must necessarily be futile and ridiculous. The chapter that pleases us least in the present book is that headed "Spare the trees." Here the author gives the "average gardener" for his alleged propensity to mutilate, and if possible destroy trees. Well we know that some men calling themselves gardeners have little sympathy with trees and make away with them when they can. Sometimes they have good reason for so doing; they want something, or are told by their employers to do something incompatible with the presence of trees. But let us suppose that there is no such necessity—that it is a mere question of personal taste and inclination, then let us ask, Which is the man that "spares the trees"?—he who, by timely thinning, pruning, and judicious management, gets the utmost possible beauty out of the tree or shrub for the greatest length of time, or he who lets the internecine war between tree and tree, and bush and bush, go on till not a well-formed—that is, a naturally formed—tree or shrub is left on the place, but only a collection of distorted cripples cruelly deformed for want of proper attention, and marked with the scars of ceaseless struggles which might have been obviated, and from which it is the gardener's business to protect his subjects. In the forest or on the mountain side such sights are often grandly picturesque, suggestive, and interesting to the highest degree; but in a suburban villa garden, such as our author contemplates, such things are incongruous and ridiculous where they are not painful. In the suburbs of our large towns we are shocked and horrified daily at the cruel treatment of shrubs and trees, and the waste of good material from sheer ignorance. We may well cry "Spare the trees," but in a different sense from our author. When we see as we do choice shrubs and trees each with a beauty of its own crowding one another out of existence, not a chance being given to any one of them to develop its beauty properly—when we see Californian monsters and Himalayan giants sweeping the bed-room windows with their branches, and knocking against the chimney-pots, truly we may say, "Spare the trees," and lament that all this barbarous want of attention, all this cruel ill-treatment, this careless ignorance, this incongruity, has not been spared us by the timely forethought and intervention of the gardener. Conservatism such as our author advocates in this matter really and truly leads to the most deplorable anarchy, and ultimately to the destruction of the very elements of beauty, picturesqueness, and comfort he is so anxious to preserve. No, it is not the gardener (there are gardeners and gardeners) who is the Goth and Vandal; and the scandal and enormity lie at the doors of those who allow ignorance, unreasoning sentiment, and temporary gratification to stand in the way of intelligence, foresight, and progressive improvement.

With the author's suggestions as to the arrangement of small plots—"Jack-towel Gardens"—we have more

FIG. 10.—OLEARIA NITIDA; HARDY SHRUB; FLOWERS WHITE. (SEE P. 44)

deals with his subjects in the following order. The first chapter contains a very exhaustive treatment of the influence of the soil on vegetation. First he discusses the position, "the lie of the land," then he takes the unfavourable physical conditions of the soil, and lastly the like chemical conditions, subdividing the last portion into sections, dealing with the power of absorption of the soil, with the causes which lead to starvation, and to excess of water and food. In Chapter II. hurtful atmospheric influences are considered; first of these frost, with the manifold injuries caused by it, then excess of heat, next want of light and excess of it, with sections on the effects of storm, lightning, hail, snow, and ice incrustations. Chapter III. contains a very full and exceedingly good account of the injuries caused by noxious gases and fluids—chief of these sulphurous acid, produced in the combustion of coal. In Chapter IV. wounds are

German authors are much too fond of classified indexes.

Such are the subjects dealt with in the book, and on each of them it is an ample storehouse of information. They are all treated of with adequate detail, but the grasp of the matter is not the same throughout. Nevertheless the book is not only trustworthy, but it is an indispensable guide to plant diseases for all students of the subject. Dr. Sorauer deserves the thanks of botanists for having brought us much nearer a true plant pathology than we have yet been. To the great body of information he has gathered together here, research must add still more before the subject can be satisfactorily laid down on truly scientific lines. Much has been done already, and among those who have worked in the right direction Dr. Sorauer's name bears an honoured place. G. M.

sympathy. His plans are not too much cut up, secure variety and interest, and as much breadth and repose as the restricted dimensions will allow. Plan B, at p. 69, with its path intersecting the whole length of the lawn, does not commend itself on paper, but paper plans on so small a scale often give a very faulty impression of the real appearance of the garden. The lists of plants suggested seem appropriate. Personally we doubt the policy of introducing fruit trees into such small gardens as the author contemplates, either from the point of view of beauty or economy; but if the fancy of the owner must be gratified in this direction he might be counselled to select certain Apples on the Paradise, or pyramidal Pearson or the Quince. A standard fruit tree in a flower garden is as ugly a thing as well, a standard Rose.

The Carnation and Picotee: its (sic) History, Properties, and Management, &c. A reprint of the essays and papers thereon by Mr. E. S. Dodwell. Groombridge & Sons.

May I be allowed to add a word of acknowledgment and welcome on the appearance of Mr. Dodwell's book on the culture of the Carnation and Picotee, wherein the knowledge and practice of many years, hitherto given at intervals, and in wider bounds, is now gathered into one permanent and more accessible form.

Speaking figuratively, from the flower it represents and treats upon, it has, like the bizarre Carnation of triple colour gifts, the white ground colour of a helpful pure intent, the bold markings of a full experience, and for the third feature of richness the history of the Carnation as a botanist's and a florist's flower.

No one need, and I think no one will, unless out of extreme innocence of the existence of Mr. Dodwell's book, attempt to go over the floral ground it covers. The history of the Carnation and Picotee could literally only be repeated, and its culture could not be more plainly and practically set forth, while the important principles of improvement by seed are explained by one who has had a rare experience and a large success.

What constitutes excellence is well known among florists, and is here faithfully laid down. What shall be the super excellence of the future, of this alone we present labourers may not write. That will ever remain an unfinished tale of any florist flower—a story without an end, so long as there shall be florists who, in their day, will lead their flowers on, and make record of advances gained.

In Mr. Dodwell's book I notice one modest omission, though from his words on "Pleasures of a garden," one might almost infer it without aid—that one point is the constant beauty of order, and spotless cleanliness, whether from weed, or pest, or decaying matter, in which his flowers always have been nurtured. It was always a pleasure to see the condition and surroundings of Mr. Dodwell's Carnations and Picotees—nothing about them to detract or distract. I know that some of us, so long as the jewel was there, have not always cared about the setting, but, nevertheless, usefulness was not fair to the jewel.

On one thing we have much to thank Mr. Dodwell for, and that is the bestowal of his very intimate knowledge of, so to say, the personal and family history of so many varieties of the Carnation and Picotee. It is the result of careful notes and close observation, and many other acts of patience and deep interest, and but for him such history would have been lost.

The Carnation is both a favourite garden flower and of high standing as one of the sterling old flowers of the florist. But not alone to the florist, I feel sure, will this book be of great practical use: much of the same treatment and attention, if paid to the usual garden varieties, will amply justify its adoption. What is needful to the florist flower will be a complete luxury to the border Carnation, though to neither is it a system of riotous living and unnatural cooing. Valuable to all who would grow Carnations of any kind is the knowing how to secure seed, from the early hour of catching the fugitive pollen on the anthers, to the time for harvesting the rather shelly and shabby-looking pod; generally necessary, also, is knowledge of the causes, symptoms, and remedy of disease. Welcome to all is the right teaching on packing the plants or their flowers. On all such matters and import Mr. Dodwell's book will be of more than limited use.

Yet I hope, too, that it will be a means of spread-

ing the knowledge and cultivation of a beautiful and fragrant flower in its more varied and more highly-gifted forms. Let it stand, to "strangers yet," on these intrinsic merits, though we could all speak of what more to a florist his florist flowers are. I would only remark that the Carnation and Picotee are not necessarily pot plants, neither are they a whit less frost-proof than the border kinds. Some are of a habit more slow of increase, and of slenderer growth; but must will be found robust enough for the open garden. There they will, as two-year-old plants especially, be abundant bloomers, and as showy as any rougher things; but the more they flower the smaller the size, as indeed also with the rougher things. The severer the exposure, the less lasting their beauty; but so it will be, too, with coarser kinds. In the matter of propagation the method of always having a succession of plants from layers is the best. No winter will destroy a healthy rooted layer, but in two-year-old plants, or older, winters like the last will be found fatal in destroying the pith of an old main stem, and so the entire plant.

I hope that, even as a garden flower, the florist Carnation and Picotee will become more known, and that Mr. Dodwell's words of guidance may fulfil the practical horticultural object for which he has written the length and breadth of his long experience as a grower, judge, and raiser of the Carnation and Picotee. F. D. Horner.

THE NOMENCLATURE OF PARADISIA.

Now that botanists have carried it thus far and saddled it with such a pleasant name it is hoped they will rest on their arms and leave it alone. I have traced it through nine Latin or Greek generic names, and three or four English names, such as Liliaster, St. Bruno's Lily, and Savoy Spiderwort. None of the generic names are very recent, which shows that the older botanists were quite as mischievous in their nomenclature as those of the present day, and might well have been asked "where they were going."

Paradisia is so named because considered a suitable inhabitant of Paradise. Bartoloni in his *Flora Italiana*, iv., 132, authorises this name, but many other European botanists have each named it according to his own liking. Linnaeus is quoted as the authority for both *Hemerocallis* and *Anthericum*, although it is most probable he authorised *Hemerocallis liliastrium* only. The plant is described in Loudon's *Encyclopaedia of Plants* under both the above names in the first edition of the book, and almost in the same words, referring in each case to the *Botanical Magazine*, t. 318, where it is figured as *Anthericum*. It is described and figured in the *Illustrated Dictionary of Gardening* as *Anthericum*, but is referred to *Paradisia* later on. In the *Journal of the Linnean Society*, xv., 285, Czacka is the adopted name, and is perhaps next to *Anthericum* that most commonly employed in gardens. Other names, such as *Phalangium*, *Liliastrium*, *Alloborgia*, and *Hyperogae*, have probably never been employed in British gardens, nor much quoted in gardening books. Amidst all this tangled synonymy it is significant to note that the specific name, *Liliastrium* seems to have been retained in every case except where the latter has been used by Link in his *Hilffbuch*, i., 173, as the generic name, when *Liliastrium*, album was used. If it could be demonstrated that the latter was the oldest name it would be a very suitable and desirable one to adopt; but the mischief attached to the alteration of long-standing or well known garden names is incalculable, and cannot be appreciated by gardeners generally who hate synonyms, nor can understand why botanists alter them, even if only to rectify a popular but erroneous garden name. There is but one species of *Paradisia*, namely, *Liliastrium*, a native of the Pyrenees and the Alps of middle Europe generally, from whence it was introduced to this country in 1629, and may probably have retained a position there ever since, seeing that it is harder than some people are willing to imagine. It likes a tolerably moist, rich, open soil, but is not fastidious in that respect, and maintains itself in the open border without the slightest artificial protection even in the northern parts of this island, attaining an average height of 18 inches, flowering in spring or early summer and then going to rest. Speaking broadly, it would bear the same relation to *Hemerocallis* that *Scilla nutans* does to

Hemerocallis. The perianth is six-parted, with hypogynous stamens, while *Hemerocallis* has the perianth united at the base, and the stamens seated upon it. *Scilla nutans* has the perianth segments slightly united at the base, the stamens, however, seated upon it, and *Hemerocallis* has a tubular flower. *Paradisia liliastrium* is figured in *Flore des Serres*, 2132, where a great number of synonyms are given. J. F.

The Flower Garden.

PRUNING AND INCREASING RHODODENDRONS.

THIS is a good time to trim in Rhododendrons, as if cut in now they will throw up an abundance of young shoots in a few weeks' time, but the growths made will not bloom the following year. Should it be desired to increase the stock of any particular variety of these or hardy Azaleas, the present is a good time to layer them. Prepare some good sandy peat and surround the plant with a mound about 6 inches in depth. Get some strong hooked pegs and secure the branches on which it is desired to operate, making them fast to the ground. With a sharp knife proceed to tongue the shoot, cutting it from below in a slanting direction upwards. Be careful not to cut too deep, as the wood is brittle. Mound some of the sandy peat over the shoot at the place operated upon and a flat stone can be laid atop of all to prevent evaporation, and secure it from being disturbed by birds scratching. The soil must never be allowed to become dry, else the rooting process will not proceed rapidly. They will also root freely without tonguing, but not so quickly. Most American plants are now growing freely, and they will derive great benefit from liberal doses of water; applications of weak cow-dung water will be of great benefit.

DAHLIAS, HOLLYHOCKS.

Continue to tie up Dahlias and Hollyhocks as they advance in growth. Use rather broad strands of tying material, so as not to cut the stems. If it be attempted to show either of these, it will be necessary to reduce the number of spikes on Hollyhocks to one; and the quantity of blooms on Dahlias will require to be reduced in number. Frequent waterings with manure-water should be given, and a good mulch should be spread over the beds. If this is likely to prove objectionable, 2 or 3 inches of soil can be scraped from the bed, the mulching material then laid on, and the soil returned on top. The dry soil will prevent the escape of ammonia, and will also neutralise the smell of the manure.

ROSES.

Roses will require liberal supplies of manure-water. If this be neglected mildew will result, followed by the total loss of flowers. Should mildew appear at once take measures to stop its ravages. Syringe the trees, and while they are wet dust them over with flowers of sulphur. I have tried double-refined petroleum with good results. Heat raw-water to a temperature of 85°, and put into 6 gallons of it a small 60-floz-pot of petroleum. Stir it up twice in the vessel with the syringe before each draw out. Be careful not to draw from the very top, and do not use any after it gets within 3 inches of the bottom of the vessel. There is nothing which I have tried as yet so deadly with red spider as petroleum. Stop all gross shoots on Roses, to equalise the flow of sap. The shoots thus stopped will throw two or three moderate shoots, and will flower well in autumn. Budding must be no longer delayed, and Carnations should be layered forthwith. Wm. Bailly, Luton Ho.

PLANTS AND THEIR CULTURE.

FERNERY.

IN this department more air must now be given to mature the fronds, and a plentiful supply of water should be given to the roots, whether in pots or planted out. The stems of Tree Ferns of all sizes must be kept well moistened, thereby encouraging them to increase in bulk, as well as causing a more robust growth in the whole plant. Shading of moderate thickness should be used, and that only when the sun is shining fully on the house; blinds that are fixtures should be avoided if possible. Put

up such seedlings as may be required. Now is a good time to start a batch of *Adiantum cuneatum* and *A. gracilimum*, which have been at rest for a short time. Any of the small and delicate varieties, such as *Chellanthus*, *Oncidium japonicum*, *Llavea cordifolia*, &c., which may not be doing well, should be repotted, using good fibrous peat, similar to that employed for Orchids, with plenty of broken sandstone and charcoal intermixed; elevate the plants slightly above the rim of the pots, and do not over-pot them. Encourage root-action as much as possible; if a good quantity of roots is not made during the summer or early autumn, it is very difficult to keep the plants in a healthy state through the winter. Trailing varieties, such as *Lygodium scandens*, should be tied to trellises or sticks.

The Filmy Ferns should have careful attention, never allowing them to suffer from dryness at the root, or in the air of the house, for if this point be overlooked the ends of the fronds will become brown and unsightly. Keep the blinds down over this house so long as the sun shines out. Pot up singly any seedlings of last year; they will make nice little plants by next season; regulate the creeping rhizomes on pans and rockwork, so as to get the space covered where desired.

AZALEA-HOUSE.

Specimen plants of these when in active growth must be supplied regularly with some fertiliser, such as Standen's or Clay's manure, giving also liberal supplies of water at the root, except to those which have been recently potted, and have not yet got hold of the new soil. Syringe regularly twice a day to keep up a moist atmosphere, as well to keep thrips in check as to promote healthy foliage. If thrips be present it is better not to resort to smoking until the growths get more matured, and no more shade should be given than is necessary, shutting up the house about 2.30, except on days when the sun is very hot, when it may be closed about 4 o'clock. Plants that have made their growth should be removed to an airy house or pit; at no time would I advise the placing of Azaleas out-of-doors without some protection against storms. All plants that were grafted some time ago, and have made a nice growth, should have a few ties put to them, as it is frequently the case in moving or rearranging the plants that some of them get their scions broken off, and most commonly where they can be ill-spared.

THE CONSERVATORY.

This structure will now be gay with plants, both flowering and foliage, and these intermixed with Balsams, Celosias, Tuberoses, Pelargoniums, Gloxinias, Fuchsias, &c., the benches, &c., edged with Ferns, Pansies, Tropæolum, Tradescantia, or some other graceful plant. See that the plants are not crowded together. Regulate the trailers on the roofs, trellises, and pillars; do not tie them in too closely or their elegance will be lost. All such plants as are planted out in narrow borders, will require frequent waterings, otherwise their blooming season will be much shortened. For a few days keep the ventilators a little closer, near plants which have just been brought in from warmer houses.

GREENHOUSE PLANTS.

Successional batches of tuberous Begonias, Coleus, Balsams, Fuchsias, and similar useful plants should now be coming forward to take the place of those that are getting past their best. Pelargoniums when over should be placed out-of-doors, in a sunny position, to ripen their wood prior to cutting down. Hydrangeas, when the flowering is over, should be placed with the Pelargoniums, but giving them a large supply of water at the roots. Cuttings of these should be put in without delay, singly, in pots, in bottom-heat. If kept in single stems they make fine blooming heads early for another season.

All soft-wooded Ericas will now be making free growth, and will require liberal supplies of water, and during the bright hot days we are experiencing will be benefited by being drenched over with the syringe. If mildew should show itself, a dusting of sulphur must be applied. In this department, if at all crowded, many plants of hardier constitution may be placed out-of-doors, such as Camellias, Greivilleas, Acacias, Agapanthes, Lomatias, &c., if they have completed their growth, placing them in shady positions at first, and ultimately bringing them in a more sunny place later in the season; this must be observed, otherwise the foliage will get discoloured and burned, and oftentimes causing a great gap in the plant supply where it can be ill-spared. *A. Evans, Lyth's Hill, Haslemere.*

FRUITS UNDER GLASS.

PREPARING STRAWBERRY PLANTS FOR FORCING.

THE first step to be taken in this direction is to obtain the necessary number of 6 and 7-inch pots—only a small percentage of the latter size for late varieties—and well crock them, by placing a large piece of crock in the bottom of each pot, then 2 inches thick of two or three smaller sizes (the smallest pieces being placed on the top), over which sprinkle a handful of fresh soil, to prevent the ingress of worms, and over that a few rough pieces of loam or leaves. This done, fill the pots to within an inch of the top with a compost consisting of three parts good loam and one of horse droppings, rubbed through a quarter-inch sieve, ramming it in firmly as the work proceeds. The pots should then be taken to the Strawberry quarters and placed so as to reduce to a minimum the chances of watering the plants and gathering the fruit. The runners should be layered in the centre of the pots as soon as they are large enough to handle, and secured there by means of small pegs (one to each plant), a sufficient number of which should be made beforehand out of old brooms on wet days. The best runners should, as a matter of course, be selected, and the superfluous ones cut away as the work of layering proceeds. The plants thus layered should be watered overhead every afternoon during bright sunny weather; this, in addition to keeping the surface of the soil moist, which is all that is required until the roots have pushed into it, will keep the young plants clean and fresh.

As soon as they have become sufficiently established to admit of their being severed from the parent plants they should be removed to a favourable situation, where they will be well exposed to the sun, and be placed, not too closely together, on sifed coal-ashes, or on the brick walls enclosing Vine borders. From this time until the plants have completed their growth they should have liberal supplies of diluted liquid manure at the roots, together with an occasional surface-dressing of Beeson's manure, so as to develop large consolidated crowns; and with this object in view, all runners and any small crowns that may proceed from the original and principal ones should be removed as soon as they appear. As the runners, one in each, are being layered the points immediately beyond the miniature plant should be pinched out.

THE BEST VARIETIES FOR FORCING.

These are Vicomtesse Hericart de Thury, La Grosse Sucrée, Keen's Seedling, President, and Sir Joseph Paxton; and the entire number of plants grown should consist of as many of the two last-named varieties as the three first-named ones together. These varieties make a good succession by putting them into the forcing-house in the order in which their names appear.

PEACHES.

In order to assist the trees in late houses to sell fine fruits they should be kept well supplied with liquid manure at the roots, every eight or ten days, until the fruits commence colouring, when supplies of clear water will be sufficient. Failing supplies of liquid manure being at hand an occasional surface dressing of Beeson's manure before giving clean water at the roots will answer the same purpose. The shoots should be kept tied up to the trellis and all lateral growths be pinched clean out, and in tying the young and hest placed shoots in their proper position to the trellis those of last year's growth, which have no fruit on them, and which in the ordinary way would be cut out at the winter pruning, may, with advantage to the tree, be removed forthwith, using a sharp knife. Anything approaching crowding of the shoots should be avoided, otherwise the very object which most gardeners have in view—the production of good well-ripened wood—will be defeated.

Houses in which the fruits are ripening should have a sufficient thickness of soft dry grass laid on the bed beneath the trees to prevent any of the fruits which may fall from being bruised. This is better than looping a piece of garden netting underneath the trees, unless it be secured pretty close to the

latter, and be made of some soft material, otherwise the ripe fruit would sustain injury in the fall by coming in contact with the net. I need hardly say that these houses should have abundance of fresh air admitted to them day and night, and the trees, regardless of the fact of the fruit being ripe, should not be allowed to suffer for want of water at the roots—a condition which would cause them to drop their fruit sooner than they otherwise would do, and their leaves to become infested with red-spider. Bearing this in mind the soil (if indoors) should be thoroughly watered before putting the material indicated above on it, and again, as soon as the fruit has been gathered, and once or twice during the interval, should the weather be hot at the time, the trees should be well syriaged overhead morning and afternoon after the crop has been taken.

FIGS.

Trees swelling their fruit should, in order that the latter may attain to large dimensions, have occasional waterings of liquid manure at the roots, and the points of strong growing shoots should be pinched out prior to tying them in to the trellis, and all superfluous growths be removed forthwith. Syringe the trees and house generally, in the morning and afternoon at shutting up time—about half-past four o'clock—when the temperature may be run up to 90°. *H. W. Ward, Longford Castle.*

HARDY FRUIT GARDEN.

WHERE bush fruits are grown extensively, and the greater part of it has to be gathered for preserving, a busy time is now at hand, and considerable management will be necessary, especially during changeable weather, in order to harvest the crop in a satisfactory condition. When the weather is favourable it is by far the best plan to employ as many hands as possible, so that when the fruit is ripe it may be gathered as quickly as possible. Should this excessively dry weather continue, undoubtedly more hands than are available will be required for watering. At least the roots from which the dessert Strawberries are to be gathered for some time to come should receive timely attention in this respect, or the bearing season will be quickly over. The nets should be entirely removed two or three times during the period the plants are fruiting, and all weeds and useless runners removed, as much for the preservation of the nets as for the benefit of the plants. The breastwood should now be spurred back on wall Plums and Apricots, and afterwards the trees should receive a good syringing or hosing overhead, and a good soaking of water at the root. Young trees growing rapidly should receive attention as to pinching and training as opportunities occur, and the growths be kept clean by frequent syringings. *G. H. Richards, Somerley, Ringwood.*

BUPHANE TOXICARIA.—This plant is generally recorded under the name of *Brunsvigia*, and sometimes under that of *Hæmanthus*, some of the species of which it certainly resembles strongly, such as *H. Catherine* and *H. Kalbreyeri*, in the many-flowered umbels of starry flowers. The latter, however, throws up its flowers at the same time, while *B. toxicaria* is perfectly leafless, or merely showing the tips of the young leaves. The scape is exceedingly short, with a dense umbel of pedicellate starry red flowers. They are, however, generally recorded as pink, but are certainly much darker in the specimen flowering in the Cape-house at Kew. As in *Hæmanthus*, the stamens are a conspicuous feature of the flower, and the filaments in the present instance are red, with white anthers, until they burst, exposing the pale yellow pollen. The pedicels elongate after flowering, the lower fall down until the fruiting umbel presents a globose outline. Flowering is of rare occurrence with this *Amaryllid* in this country, and a quantity of curiously characteristic distichous leaves is usually all the growth made in a season when the plant goes to rest, and remains in that condition for great part of the year. It is grown as an economic plant, because the expressed juice is used at the Cape as an ingredient in the poison used to tip arrows. It is called by the Dutch, *Bolletje's Gift*, or *Poison-bulb*. There is a figure of the species in the *Botanical Register*, 7567.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY,	July 13	Royal Horticultural Society: Meeting of the Fruit and Floral Committees, at 10 A.M.; Scientific Committee, at 4 P.M.; Show of Flowers and Fruit.
		East London and Rose Society's Show, Norwich Rose Show (10.0 to 1.5).
		Sale of Imported and Established Orchids, at Protheroe & Morris' Rooms.
		Bedford and Berkshire Horticultural Society's Show.
WEDNESDAY,	July 14	Hull, East Riding, and North Lincolnshire Horticultural Society's Show (10.0 to 4.0); Manchester Show.
		Northampton Horticultural Society's Show.
		Chesham & Horticultural Society's Summer Show.
THURSDAY,	July 15	Show of a Collection of Orchids in Flower and Bud, at Stevens' Room.
FRIDAY,	July 16	Sale of Imported Orchids, at Protheroe & Morris' Rooms.
SATURDAY,	July 17	Royal Botanic Society of Manchester: Rose Show.

IN spite of the attractions offered by the Rose Show a gloom hung over South Kensington on Tuesday last. The Roses, poor things! did their best in the sweltering heat. If they did lose their character, change colour, and open their eyes, that was not their fault; they preserved their beauty as well as could be expected, and the Rose maniacs, who are about as business-like a set of people as we know, also did their parts well. Our friends are so much of specialists that we almost fear to express any opinion, but we do not think we are far out when we say that the show was not up to the average, though as much so as the season the Roses have gone through, and that they are now enduring, would lead us to expect. Among hybrid perpetuals A. K. Williams was remarkable for its brilliant rose colour and the perfect symmetry of its flowers. Madame de Watteville is a new Tea of great promise, with large flowers of pale cream colour, flushed with pale violet-pink. Lady Mary Fitzwilliam, one of Mr. BENNETT's seedlings, was shown in fine condition, with large very full ivory flowers flushed with pale pink—very lovely. The prize for the best Rose in the exhibition, however, fell to a white Rose, Souvenir d'Elise Vardon. It was very large and beautiful, and we shall not contest the judgment; only we think the judges laid too much stress upon mere size, but rosarians, and hot-water apparatus-makers are gentlemen Editors have a wholesome fear of, and so we shall be careful in expressing an opinion, though we cannot help thinking that in class 22 the basket of Tea Roses marked No. 2 was better than that to which the judges awarded the first prize; but, good rosarians, this is really only a matter of opinion!

But as we have said, not even the Roses could dissipate the gloom from the faces of the horticulturists. What could be the matter? It was not the heat. Growers of stove and greenhouse plants can stand that. It was the news that the great Provincial Show at Liverpool, from which so much was hoped, had proved a financial failure. We need not point out in the present state of the affairs of the Society how serious a matter this is, nor how great are the disappointment and surprise. When a great catastrophe has happened the British public looks out for somebody to hang. On this occasion they will have a difficulty in finding anybody to fit the noose. The clerk of the weather was most amiable; by such a sunny sky, not only for one day, but for the whole duration of the show, has rarely, if ever, been experienced. The show, if not quite the most varied, or quite the best, since 1866, was, at least, quite up to the average; the exhibitors did their duty in the main; the Council, instead of keeping aloof, took an active share in the work, and mustered in force on the ground; the managers, Mr. BARRON and Mr. RICHARDSON, with Mr. KER and the staff, did all that men could do, and a good deal more than most would have done. The Liverpool horticulturists did their part well, and yet we have sorrowfully to chronicle a dismal failure, and, this in a city

swarming with people as densely as London itself—that is, if area be considered. On the five-shilling day, it was said, Wait till the shillings come; on the half-a-crown days, still the hope was held out—the shillings will make amends; but the shilling days came, and the sixpenny days came, and they were, if possible, more thinly attended than the others. What could be the reason? The Press gave good reports, the show was fairly, if not extensively, advertised; the Mayor did his best, and yet! The only causes of failure that we can think of were the elections and the close proximity of the vast and varied "Shippers" Exhibition. This absorbed all the shillings and sixpences, and left the Horticultural Society, we fear, with resources not more than sufficient to pay the attendants, and utterly inadequate to defray the other items of the cost. Had some arrangement been made earlier in the week, so that one reduced payment should have admitted to both exhibitions, the result might have been different. The result might have been different also if the elections had not been going on at the time, but Liverpool is so vast and is the centre of so vast an outlying population that the elections could have had but little effect. So far as horticulture is concerned the loss is immaterial. The show was a good one, and it the Society could not command success it at least amply deserved it. Instead of finding fault, as some are disposed to do—they always do on such occasions—we think the horticulturists are under a debt of gratitude to the Society for having made a right gallant attempt in the proper direction, and their failure is a matter not only for sincere regret, but for such support and assistance as the horticulturists may be able to give. The matter was gone into with spirit for the benefit of horticulture and horticulturists, and they should be the last to find fault. We shall probably not hear any more of provincial shows for some time to come.

As a set-off against the melancholy failure at Liverpool, it is pleasant to record a genuine success for the Gardeners' Royal Benevolent Institution. Mr. SHERWOOD, as head of one of the largest seed firms, was the right man in the right place, and we are glad to learn that the largest amount ever collected (£1430), not even excepting occasions when Royalty presided, was got together when one intimately connected with gardening and gardeners filled the chair. We hope the precedent now set will be followed in the future, and we hope that the gardeners will on another occasion send their shillings and sixpences, or as much more as they can afford, freely. We had occasion to speak of this in a former issue; it is satisfactory to know that ultimately a considerable number of small donations were received from gardeners.

— PEONIA BROTERI. — We gladly avail ourselves of Mr. BARR's courtesy by publishing an illustration of this species taken for us from a living plant in his collection (fig. 11). The species is about 2 feet in height, with crimson, fragrant flowers, and is intermediate in general characters between *P. corallina* and *P. officinalis*. It was described by Mr. BAKER in our columns, July 5, 1884, p. 10, and is now, as we believe, figured for the first time. It is a native of Spain and Portugal.

— THE "GARDENER'S BENEVOLENT." — Mr. CULLEN must really excuse us if we refrain from quoting the full title of the Institution he continues to direct with such skill, and with such advantage to the community. We know he will, for he has not communicated to us an interesting fact with reference to the VEITCH family? In the spring of 1843 he was, he tells us, introduced to the late Mr. JAMES VEITCH of Exeter, who became a subscriber at that time; his son, whom most of us remember at Chelsea, was a firm supporter of the Institution, and at the festival on last Friday, two more generations of the VEITCH family were represented in

the persons of Mr. HARRY VEITCH, the present head of the firm, and Messrs. J. H. and ARTHUR VEITCH, the great-grandsons of the original JAMES VEITCH. It is permitted to very few Secretaries to be personally acquainted with four generations of one family, and the fact says a good deal for the family as well as for the Society.

— "GARDENERS' CHRONICLE" PRIZES.—In reply to several enquiries we have to state that the first prize essay will be published as a whole or in part so soon as the woodcut reproductions of the drawings are completed. This necessitates a delay of some weeks.

— MR. H. SCHMITZ.—We learn that Mr. H. SCHMITZ, formerly Secretary of the Compagnie Continentale of Ghent, has established on his own account a horticultural agency and seed store on a large scale at 20, Rue de Brabant, Ghent.

— THE LIVERPOOL SHOW.—The prizes which Messrs. JAMES CARTER & CO. offered to be competed for at the above show on the 29th ult., for their Telephone, Telegraph, Stratagem, and Pride of the Market Peas, fifty pods of each, were not (in consequence of the judges having confounded them with those that were staged for the Royal Horticultural Society's prize for three dishes of Peas) awarded until the second day of the show, when the 1st prize was given to Mr. H. W. WARD, Longford Castle, the only exhibitor in this class, and who also, as previously reported, secured the Society's 1st prize for three dishes of Peas.

— ROYAL GARDENS, KEW.—A second edition of the *Official Guide to the Museums of Economic Botany* has been published, or rather to No. 1 Museum. The value of such a catalogue depends upon the compiler. The exhibits are there, as we all know, in profusion, and they are admirably arranged, and now the showman has done his part, and provided an excellent systematic catalogue.

— ROYAL HORTICULTURAL SOCIETY: BOILER CONTEST AT LIVERPOOL.—The competition in the three classes began about mid-day on Tuesday, Wednesday, and Thursday respectively, and each lasted till about 8 o'clock the next morning, being banked up about 8 P.M. the previous night. In the 1st class, for boilers capable of heating 2000 feet of 4-inch pipe, the entries being Messrs. F. & J. MEE, of Liverpool, with a 6-foot wrought-iron saddle boiler, having water-way bars and back; Messrs. FOSTER & PEARSON, with their "Chilwell Nurseries" boiler, 6 feet long, being an adaptation of the Rochford pipe boiler; and Messrs. WOOD & CO., of Bristol, with a tubular saddle boiler. Messrs. MEE came out best. In the 2d class, for boilers capable of heating 1000 feet of 4-inch pipe, the entries were Messrs. MEE, with the same boiler; Messrs. FOSTER & PEARSON, with their "Eestoon" boiler, a wrought-iron sectional boiler, with tubes connecting the sections; Mr. F. WITHERSPOON, of Durham, with his "Red Rose" cast-iron tubular saddle boiler; and Mr. SAM. DEARD, of Harlow, with his coil boiler on waterway bars. Messrs. FOSTER & PEARSON retired from the contest during the day, and Mr. DEARD's boiler showed the best results. In the 3d class, for boilers capable of heating 500 feet of 4-inch pipe, the entries were—Mr. J. G. WAGSTAFF, with his combined wrought and cast-iron saddle boiler, with waterway bars; Mr. S. DEARD, with a small coil boiler (without waterway bars); Mr. WOOD, with a similar boiler to his 2000 feet one, but smaller; and Messrs. FOSTER & PEARSON, with their independent wrought-iron "Liverpool" boiler, which they withdrew from competition. Mr. DEARD's boiler again came out best. Messrs. MEE and Mr. DEARD were awarded Silver Medals, and Messrs. WITHERSPOON, WAGSTAFF, and WOOD a Bronze Medal each.

— MISTLETO IN JULY.—Well, we have very extraordinary weather this summer, that is certain. The newspapers are so busy that they have failed to record the extraordinary Gooseberry, though the state of Kensington Gardens has not escaped notice, and the big show at Liverpool was noted, as usual, as the biggest of its kind since 1866. But we—we, the *Gardeners' Chronicle*—have something more extraordinary to record—something not quite

so often dished up, and that is the appearance of Mistleto berries at midsummer, or soon after. The branch lies on our table before us with its glistening white berries, and sends us back in memory to that period a few months since, when wagonload after wagonload passed our window to the adjacent market, as they will probably do next December. Its appearance at midsummer baffles calculation. Can it have anything to do with the elections? Or

joined the Society, which has been in existence little more than four months, and lectures on various gardening subjects have been given. Mr. J. CROOK has been appointed librarian, and Mr. J. HUGHES has shown great energy in obtaining the special donations to the library fund. The Birmingham Botanical and Horticultural Society has arranged that for an annual subscription of £5 5s. the Gardeners' Society shall have the privilege of free admissions on all or-

collections which might otherwise escape the observation of those most concerned. The plant named at the head of this paragraph was shown at the National Rose Society on Tuesday last, at South Kensington, and the solecism of showing an Irid at a Rose show may be pardoned with the expression of a hope that the authorities will do it again. Their reputation is so well established, that no one will misconstrue their action, but all will gratefully appre-

FIG. 11.—*PAEONIA BROTERI*: FLOWERS CRIMSON, FRAGRANT. (SEE P. 48.)

specimen comes from Gordon Castle garden, up in Aberdeenshire.

— THE BIRMINGHAM GARDENERS' MUTUAL IMPROVEMENT SOCIETY.—A library in connection with this recently formed Society was opened lately, funds to the amount of £60 having been subscribed by gentlemen of Birmingham for this purpose, and 100 volumes of standard gardening works have been already purchased at a cost of £40, and fifty-two other books have been generously presented by other persons. Two hundred members have already

nary days and Sundays to all members on presenting their cards of membership, and to free access to the Botanical Society's library for reference, and other privileges. Mr. W. B. LATHAM, Curator of the Botanic Gardens, is the Chairman of the new Society, and a series of essays and discussions, as well as lectures, are being arranged for the autumn and winter season.

— *GLADIOLUS WATSONIODES*.—The Kew authorities are rendering excellent service by exhibiting from time to time specimens from their magnificent

ciate the feeling which induces them to lay their treasures before the horticultural fraternity. The present species is a *Gladiolus* with a spike of orange-pink curved trumpet-shaped flowers. The special interest lies in the fact that it was raised from seed collected on Killimanjaro, the snow-capped mountain of South Tropical Africa, at a height of 10,300 feet, by Mr. H. H. JOHNSTON, and sown in January, 1885. Mr. O'BRIEN at once recognised the plant as *Gladiolus Watsonius* of the *Botanical Magazine*, t. 450, and t. 569. This latter name is not taken up in Mr. BAKER'S *Systema Iridacearum*, at least, we have not

discovered it. In any case, the discovery of the plant on the slopes of Kilimajaro is a fact of great significance and high interest.

— **BANANA CULTURE IN COSTA RICA.**—The British consul, writing on the agriculture of San José, Costa Rica, says the cultivation of Bananas on the Atlantic slope is increasing steadily, owing to the success which has attended those who have taken up lands alongside the railway for that purpose. Many who bought land on credit at £1 per acre have been enabled, in less than four years, to pay off not only the principal and all working expenses of clearing and cultivating the land, but to be in possession of a farm of some 250 to 500 acres of Banana plants, grazing-ground, and woodlands, bringing in an income of £60 to £80 per month.

— **THE ROYAL OXFORDSHIRE HORTICULTURAL SOCIETY'S SHOW.**—There were six entries for the prizes offered by Messrs. WEBB & SONS, of Wordsley, Stourbridge, and the competition was keen, all vegetables being of first-class quality, and in addition to these their customers were fortunate in taking thirty-two 1st and 2d prizes in the open classes.

— **ARRACACCA.**—From a letter addressed to the London Secretary of State for India by the Director of the Royal Gardens, Kew, and published in the *Proceedings of the Agricultural and Horticultural Society of India*, it seems that the Arracacha (*Arracaca esculenta*) is now fairly established in India. Mr. MORRIS, lately of Jamaica, considers it "a most valuable food-plant," becoming more palatable and desirable the longer it is used, and states as his opinion that "if the natives of India take to it as an article of food, he could conceive nothing more likely to flourish in the hill districts, and to afford with little labour the means of sustaining life under adverse circumstances." Regarding the distribution of the plant from Kew, Mr. DYER says:—"A supply of tubers received at Kew from Jamaica was sent in 1853 to Saharanpur, Ootacamund, and Ceylon, and in 1854 to Calcutta for Darjeeling. Mr. LAWSON, Director of Government Cinchona Plantations, Parks and Gardens, Nilgiris, reported in 1854 that plants had been raised from tubers sent from Kew. The result of the other two botanical establishments has not reached us. From Ceylon Dr. TRIMEN has recently reported that he has raised the Arracacha from seed obtained direct from Jamaica. He appears to have obtained the tubers without difficulty and in abundance. As a matter of taste, he has a less favourable opinion of them than Mr. MORRIS; but the important point is, that the introduction of the esculent into India is accomplished, and that its further diffusion need present no difficulty."

— **BRICK TEA.**—Reporting on the trade of Foochow for 1885 the British consul says the manufacture of brick-tea of varieties of tea-dust by Russian merchants only, for export to Siberia, is acquiring considerable importance. The low cost of the dust, the cheapness of manufacture, the low export duties upon it, together with the low import duties in Russia, combine to make this trade a success and a profitable business. "The most expensive part of the business is the freight on the bricks by sea to Tientsin, and the carriage on camel-back to Kiachta. The Russian merchants export Tea-leaf, but in small quantities, for Russia proper, their chief business being the making of brick-tea, their commissions on orders from Russia being large, and no loss is incurred. The brick is so beautifully made, and is so portable, that it has surprised me that the British Government does not get its supplies from this port; they would find it less expensive and wholesaler than what is now given the army and the navy. I think a trial should be made, or that a Government agent should be employed on the spot to manufacture the brick-tea in the same way that the Russians here and at Hankow do."

— **CYTRIFOLIUM GODEFROYE AND ITS ALLIES.**—Widely distinct as the types *C. concolor* and *C. niveum* may seem to be, the differences are all bridged over by *C. Godefroye* and its forms. The two former are figured in the *Gardeners' Chronicle*, vol. xix., a.s., p. 19, fig. 3, where the leading and characteristic differences are pointed out. All have flowered from time to time at Kew, but at present a

whole series of forms is flowering together, affording an excellent opportunity for comparison. The leading points of *C. concolor* are the narrow petals, the elongated laterally compressed labellum, the rhomboid-triangular staminode, or columnar shield, with its upper edge pubescent, the pale yellow ground colour dotted with purple, and the leaves spotted or blotched with grey above, and closely mottled with purple underneath. *C. niveum* differs from the above in the broader petals, shorter more inflated labellum, the shorter subreniform staminode, with a tooth in the notch, the white ground colour of the flowers, and in the under-surface of the leaves being generally of a uniform dark, almost black, colour. This character of the leaves, however, is not altogether constant in *C. niveum*, which has its foliage sometimes uniformly green above. *C. Godefroye* is distinguished by its broad sepals and petals, short sub-inflated labellum, roundish tridentate, often almost orbicular, staminode without the pubescence on its upper edge, and the white ground colour of the flowers more or less heavily spotted, almost blotched, with purple. A form of this, also flowering, has the narrow laterally compressed labellum, and the pale yellow ground colour of *C. concolor*, but otherwise conforms to *C. Godefroye*. All these forms are, botanically, varieties of one variable species, although for horticultural purposes they may be treated as distinct.

— **ORNITHOCEPHALUS GRANDIFLORUS.**—Of the twenty known species of this genus the subject of this note is by far the largest, most handsome and deserving of the attention of Orchid growers. The other members of the genus, though diminutive and inconspicuous, are interesting on account of the unwanted and extraordinary elongation of the rostellum and pedicels of the pollinia. This is noticeable to some extent in *Phalenopsis Lowii*, which, however, does not approach anything resembling the development of those organs in the large-flowered *Ornithocephalus*. The flowers themselves are produced in long drooping racemes, exhibiting a peculiar mixture of the purest white and deep green. The sepals and petals are white with a distinct green blotch above the base excepting the upper sepal, which is concave add with out the blotch. The labellum is white with large-toothed deep green crest, which serves greatly to give character to the flower. A coloured plate given in the *Belgique Horticole* for 1854, p. 50, gives an excellent idea of the natural habit, size and appearance of a plant in full flower but the artist has painted the flowers with a decided tinge of yellow which does not correspond to that of a flowering specimen in the cool Orchid-house at Kew. LINDLEY first described this species in 1840 from a dried specimen from the Organ Mountains of Brazil—and the good qualities of living flowering plants excels all that he said regarding them. This species was shortly described or noticed in the *Gardeners' Chronicle* by REICHERNBACH, August 5, 1852, but excepting this no notice seems to have been taken of the genus in gardening periodicals although several of the small-flowering species have flowered in this country from time to time, chiefly in gardens of the curious or of specialists.

— **MAURANDYA BARCLAYANA.**—The genus, as now constituted, contains only about six species, even after *Urospermum* and *Usteria* have been merged in it. They are confined to Mexico and are therefore not sufficiently hardy to withstand our winters out-of-doors, although they may and are cultivated successfully in sheltered places in summer. The species mentioned above is probably the best known and oftenest cultivated in this country, and forms a fine subject for trellis work, supporting itself by twining or twisting petioles. The cordate and hastate slightly lobed leaves are beautifully enlivened by the long tubular flowers that vary considerably in colour. A figure in the *Botanical Register*, t. 1105, erroneously spelt *Maurandia Barclayana*, exhibits flowers with a whitish tube and a deep violet lamina. Two varieties of the plant grown at Peardell Court have more or less overlapped one another in growth, so that the foliage is enlivened by purple flowers with a whitish tube and pure white ones. Although both must be considered as old introductions they have not enjoyed that popularity and dissemination in British gardens which their own intrinsic merit deserves. They are readily raised from seeds and might often be utilised for the same purpose as *Thubergia alata*, or both might be grown in combination. At Peardell Court they enjoy the protection of a cool-house, where

Himalayan *Rhododendrons* are grown planted out in a peat bed, margined by the profusely flowering *Streptocarpus Rexii floribundus*, in many shades, from pure white to varieties heavily striped with violet.

— **AWARDS MADE AT THE LIVERPOOL SHOW.**—Gold medals have been awarded to Mr. B. S. Williams, Upper Holloway, and Messrs. James Veitch & Sons, London, for groups of miscellaneous plants; and Messrs. James Lackhouse & Sons, York, for filmy ferns and herbaceous plants. Silver Gilt Medals have been given to Messrs. W. Cutbush & Sons, Hightgate, for group of miscellaneous plants; Messrs. F. & A. Dickson & Sons, Chester, for stove and greenhouse plants; Messrs. F. Sander & Co., St. Alban's, for a group of orchids; and Messrs. R. Smith, the Nurseries, Worcester, for a group of Clematis; Silver Medals to Messrs. Carter & Co., High Holborn, for a collection of annuals, and Mr. Charles Turner, Slough, for a group of tree Carnations; and Bronze Medals to Mr. Edward Bridge, Huyton, for *Peargoniums*, and Messrs. James Dickson & Sons, Chester, for a collection of succulents; to Messrs. Sutton & Sons, Reading, for grasses, living specimens of vegetables and roots, seeds, and models of garden products, &c. This award was erroneously attached to a notice of Messrs. Cheal & Sons' cordon-trained fruit-tree exhibit in our report of the show last week.

— **PROPOSED ROSE SHOW IN EDINBURGH.**—The horticultural committee of the International Exhibition, Edinburgh, has announced its intention of giving space in the hall of the exhibition buildings for a display of Roses from the 20th to the 24th inst. Most of the principal trade growers in the country have given assurances of their co-operation with the committee in the matter. It is expected that there will be an extensive display. Although Roses only have been specially solicited, space will be given for any other exhibits that may be sent in. It is also the intention of the committee to offer facilities for exhibits of other classes of cut flowers subsequently at different times during the season. Arrangements are also being made for a comparative trial of lawnmowers at the time of the forthcoming Kose Show should the weather intervening prove favourable; at present, however, the prevailing drought and heat give little promise of a sufficient growth of grass to fairly test the various machines exhibited.

— **THE GOLDEN ELDER.**—This shrub does well in town gardens, and in cases where it fails to develop the golden tint of its foliage it is recommended to be cut back severely so as to induce the formation of young vigorous shoots of the desired coloration. This plan does not, however, always succeed, but even as a green variety it is a very desirable plant in smoky situations. It differs from the common Elder, not only in colour, but also slightly in the size and shape of the leaflets, and especially in the convex, not flat, flower-cymes, the larger individual flowers, their greater substance, &c.

— **THE ODOUR OF RUBUS DELICIOSUS.**—To one accustomed to the odour emitted by this showy Bramble the question would naturally arise whether it derives its specific name from that circumstance. TORREY, however, in the *Annals of the Lyceum of Natural History, New York*, describes the Bramble as having purple flowers succeeded by a delicious fruit. It seems that all the plants cultivated in this country have white flowers, and, although it flowers abundantly at Kew both on a wall and in the open ground it never matures, any fruit nor even seems to set any. The peculiar odour of which it is possessed continues to be given off for a considerable period of time, evidently while young wood and leaves are developed, whether in the presence of blossom or not. Probably, however, the odour emitted is most powerful when the young foliage and flower-buds are bursting forth, especially when the air is still, and at any period of the day provided the atmosphere is moist. Moisture is not essentially necessary, but it seems to intensify the volume of the volatile odoriferous matter. There can be little doubt that this material is excreted by the reddish glands, with which the young shoots, leaves, and calyx are heavily beset while growth is advancing. The *Botanical Magazine* in describing the plant figured t. 6662, says, this species is without glands, bristles, or prickles, and the statement is repeated in *Flore des*

Seres, 2404, which quotes from the former work. The description had evidently been made from old or fully-developed specimens from which the glands had disappeared. The odour at times is distinctly discernible several yards distant pervading the atmosphere, and when the plant is out of flower, any one unacquainted with it would have difficulty in detecting from whence the smell proceeded, especially if grown in the vicinity of other plants. The odour is distinctly that of bleaching linen, and it has been described as that of soap-suds, which would practically amount to much the same thing. It is by no means over-powerful or disagreeable, and although it does not appear to have derived its specific name from the odour emitted by the excreting glands, yet there is no denying that such might have been the case, seeing that the olfactory nerves in different people are acted upon differently by the same odour. An excellent representation is given of the species in the *Gardeners' Chronicle*, 1881, xv., 537, fig. 101.

— THE NEW COMBINATION STAKE AND CLIP.—The Plaskynston Tube Company has sent us an iron stake that is at once simple, efficient, and durable; and it does away with the necessity of tying with string or grass. The stake consists of an iron tube, sharpened at one end, for driving into the ground; at the other end it is cut off square, and a slot 3/4-inch deep is cut out on one side, into which the clip is slipped. It is ingenious, and will find buyers amongst those growers of Roses, Raspberries, and trees, who want a neat and durable stake, and who do not object to the cost, which is not much in excess of worked wooden stakes.

— PEAT.—There is often found such a great difficulty in towns, and indeed in many country places, in obtaining the various kinds of peat suitable for Orchids, hard wood plants, and Ferns, that we are glad to have received for inspection peat samples from Mr. H. G. SMITH, of 21, Goldsmith Street, Drury Lane, which appear likely to fulfil all the requirements of gardeners.

— STREPTOSOLEN JAMESONI.—This is one of those plants concerning which botanists have differed not only as to the proper genus in which to place it, but also as to the natural order. At all events, the *Browallias*, the nearest allies of this plant, were formerly classified amongst the *Scrophulariaceæ*, like many other irregular flowered *Solanaceæ*. Moreover, the shrubby habit of this, the only species, would stand in the same relation to that of the *Browallias* as *Diplacis* does to *Mimulus*, and the twisted corolla tube recalls that of *Lycopsis*, as contrasted with *Anchusa proper*. There is a figure of the plant in the *Potamogeton Magazine*, t. 4908, under the name of *Browallia*, and a more recent one in the *Gardeners' Chronicle*, vol. xvi., n.s. p. 797, fig. 147. A flowering specimen in the Heath-house at Kew shows a lushy, branching shrub, with comparatively large deep orange flowers, handsome enough to merit a more extended cultivation. The leaves are small, and the plant, although stated to attain a height of 4 feet, will flower freely in a much smaller state, as that in the Heath-house does not exceed 15 or 18 inches. Although introduced in 1850, the plant has been recently reintroduced, after being lost to cultivation for a great many years.

— ROYAL VISIT TO ALDERSHOT.—Mr. J. CLARKE, Laceyman of Farnham, had the honour to supply the whole of the plants and table decorations for the luncheon on the occasion of the royal visit to Aldershot, July 2.

— PUBLICATIONS RECEIVED.—*Golden Feather* London: Society for the Promotion of Christian Knowledge, 3, Northumberland Avenue, Charing Cross.—*Notes on Flora of Flat Island*. By J. HORNÉ (Muriurus).—*Weeds mentioned in the Wisconsin Wood List of 1884-5*, and several Other Weeds. By A. B. SEYMOUR.—*Proceedings of the Academy of Natural Sciences of Philadelphia*, Part I. (Philadelphia: Academy of Natural Sciences, Logan Square).—*Caractéristiques de la fiedre Porrolysis (Gynosporeae Fossiles de l'époque Houillère)*. By Messrs. C. E. BERTRAND and B. RENAULT.—*Annual Report of the Smithsonian Institution for the Year 1884*. (Washington: Government Printing Office).

— GARDENING APPOINTMENTS.—Mr. WALTER TEDDER, of the Frame Ground, Kensington Palace Gardens, has been appointed Gardener to Mr. JOHNSON, Esq., The Bitches, Mitcham.—Mr. ROBERT ELLIS, late Foreman to the Earl of Lovelace, East Horsley Towers, has been appointed Head Gardener to Sir EDWARD MOON, Bart., Fetcham Rectory, Surrey.

HOME CORRESPONDENCE.

Strawberry Plants for Forcing.—The time is fast approaching when we shall be very busy preparing our Strawberry plants for next year's forcing. We force here several thousand plants annually, and I wish to mention a plan which I have adopted for several years with good results. A few weeks before the runners are ready to handle we collect some good firm, loamy turf, flat to be had, and then cover it with sufficient hill-rotten farmyard manure packed tightly together to set up a slight fermentation through the whole heap, with the object of destroying insects and seeds of weeds contained in the turf; this will also render the soil in better condition for the runners to root into. As soon as the runners are ready we cut the turf into pieces a few inches square, and carry it in boxes to the Strawberry beds, and upon it peg the runners tightly, finally sprinkling over with short lawn-grass. Great care should then be taken to see that the plants are thoroughly watered. In a very short time rooting will take place, and the turves must then be removed before the plants root through into the soil beneath, and be potted at once into 4 1/2's or 4 3/4's, as may be desired. We pot our earliest into 3 1/2's, and the rest into 3 1/2's, using good loamy, loam and rotten stable-manure. This plan appears to have several advantages over the system of pegging the runners at first into small pots, in that it is more economical as regards labour. The turves do not dry so readily as pots, being on the ground and sheltered by the parent plants, and by the short grass which is sprinkled over them. This is a great point, because hot and drying influences may naturally be expected during the month of July, and plants in pots often suffer very much at that time from these causes. The plant has the advantage of being less expensive than pot layering. As our potting loam is deficient in calcareous matter we top dress the pot with lime during the month of September. Before the winter sets in all the plants are top-dressed with a mixture of loam and manure from the fowl-house, and those which are required for earliest forcing are removed from the shelter from the weather, under the protection of a glass covering, the remainder are packed in leaves in an open exposed position on a quarter in the kitchen garden, and brought in as required. The sorts we use for the earliest forcing are Black Prince (small but good and very early), followed by Vicomtesse Henriette de Thury, Sir Joseph Paxton, Keens' Seedling, and President. *Alfred Gant, The Gardens, Peters, Shenley.*

Observations on Devonshire Gardens.—The most striking object in the garden at present is the *Buddleia globosa*, planted at the back of the shrubbery, with *Escallonia macrantha* in front of it. The rich orange balls of the *Buddleia*, set off by the glossy green foliage and deep red flowers of the *Escallonia*, form a beautiful combination. *Escallonia Ingramiana*, with *Platanus major* forms another fine combination with the *Buddleia*. *Terminalia* is nearly hardy here, and has passed through the late severe winter, in an open border, with the thermometer more than once as low as 20° Fahr., without the slightest injury. It has bloomed sparingly this year, but has made very vigorous growth, and is one of the prettiest evergreen shrubs in the garden. The herbaceous borders are now in their prime, with a gorgeous display of *Pæonies* of all shades, from pure white to dazzling crimson; oriental Poppies, Delphiniums, and last, not least, double Pyrethrum. The latter are of great value both for profusion of flowers and for keeping a long time when cut. *Cædusa heterophyllus* might be added to the list, with its abundance of bright purple flowers, but it spreads rapidly, and requires to be kept within bounds. *G. H. White, St. Mary Church, Devon.*

Imantophyllum or Hymantophyllum?—As the II was dropped in accordance with a law of Nature, why endeavour to revive an unnecessary and useless limb? Throughout Nature we find that parts which have ceased to be of any use are dropped by degrees, until their former existence can only be made known by dissection. All the languages derived from the Arabic and Sanskrit appear to be much simpler than their parents, so are those derived from the Latin. The multiplication of new words in the arts and sciences calls for urgent simplification of terms, and not a reversion to parents, which are more difficult to pronounce and to write. *Imantophyllum* lost its II by disuse. Hindostan and Hindoo have their II's aspirated, but no one ever attempts to write or pronounce Iodo-European or Iodo-Chinese with an H. Although the dropping of all unpronounced letters in a printed book, would give the brain a shock, as in many instances it would not, each their meaning as readily and quickly as it could read, there are signs of a desire, originating in a need, of dropping a useless letter in many words, which occur in American publications. I will remember the time when "favour"

and "labor" and others were written with a t; now, probably, many would consider it a nuisance to have to reintroduce it. Similarly, there are many words of old English, which would startle us by reappearing to-day in their old garb. There is another point upon which botanists might help to ease the brain-work. When I was at the Hagkula Garden in Ceylon I saw the Mountain Papaw. I asked for some of its seeds. The superintendent of the garden being a practical man, on the seed packet wrote, if I remember rightly, something like *Carica kundinamarcensis* [*Candianamarcensis*, from the town of Candianamarc]. Dr. Timen, before handing me the packet, saw it was not correctly spelt, and began to rewrite it, but had to stop in the middle of the specific designation for a few seconds to remember the right way of writing this six-syllabled word. Whenever I have to write this word I am never sure that I have hit it off, and only hope, as in this instance, that it may be all right. When I have had to pronounce this brain fatiguing word I have had to whisper it to myself first, and count with my fingers whether I had hit off the right number of syllables. In this case more especially there was no excuse for the invention of so terrible a specific name. Who is there that knows or perhaps cares where this unpronounceable place is? It might be in Central Africa, in Siberia, or in Patagonia; few would care to inquire. But to the person who had to pronounce and write it, it would be a relief to have to speak and write a less fatiguing word. As this is called Mountain Papaw, *Carica montana* would not only have been more appropriate, but would have indicated that it was a species or variety peculiar to mountain climates, and probably, as I have found, will not live in the plains; while the other term is simply a puzzle. There is a fine and troublesome word which has lately appeared in print, in connection with Greek troubles. If the Greek Minister in question should ever discover a new plant in the home of this Papaw, he might like to name it *Papanicholou-paulosa kundinamarcensis*. As the derivations of words of this kind of word evolution are very interesting, but they might be left to antiquarians and dictionaries of derivations. To remodel words which have been simplified by a natural process of elimination is of doubtful advantage to any nineteenth century brain, filled, as it is, like the "piu non posso" abdomen of the queen of the termites. *E. Bonavia, M.D., May 29.*

Pansies as Exhibition Flowers.—Such a large number of these, and also of *Violas*, were shown at the great Whitsun exhibition at Old Trafford, that there seems something like a revival of the Pansy as a show flower. At Manchester both Pansies and *Violas* in pots are "made up" specimens; the schedule of prizes requires they should be in pots 8 inches in diameter, and in order to have exhibition specimens of this kind made-up plants are necessary. The method adopted appears to be to take six or eight nice young plants raised from autumn struck cuttings that are showing flower; these are put into pots previous to the show, and brought on nicely into bloom, the result being—when they are well managed—that the plants have filled out their foliage and look like one specimen, even in height, the heads of flowers erect and well above the foliage, and facing one way. The average is 9 or 10 to 15 or 16 blooms, and fine blooms, too; and when three or four collections of twenty pots each are shown, and all in good condition, the effect presented by the mass of bloom is very fine. A few nice little Ferns or table plants between the collections is wanted to make a dividing line, and break up the uniformity otherwise presented. Mr. Findlay finds it necessary to state in his schedule that the plants must be rooted, merely blooming shoots without roots having been employed in previous years. As a matter of course, plants of one variety only are placed in a pot, and so there is none of that unevenness witnessed in the case of the Pansy as one may see in some of our made-up Orchids—several varieties of *Dionysium Alexandrinum* of various sizes and different markings, and *Cattleya Mossie* made up of forms differing widely in the character and colouring of the lip. It may be stated, in regard to these made-up Pansies, that a good deal depends upon how the work is executed. Some are so well done as to look like a large single plant with many shoots pegged out in a shapely and perfect manner. One thing Mr. Findlay should do—he has two classes of twenty pots of Pansies; one class simply states Pansies, the other fancy Pansies. At the recent show at Manchester one exhibitor put up only show Pansies, so called—yellow grounds, cream and white grounds, and self; but all the others had a considerable admixture of fancy and bedding Pansies. Mr. Findlay should require show Pansies only in the former class. The Rev. Mr. D'O'Connell assisted me to make the awards in these classes; and we both held the opinion that, as there was a class for fancy Pansies, the obvious intention of the framer of the schedule was, that the former class should be show Pansies only. In

point of size of bloom, as also of richness of colouring, it is impossible that the show Pansies can compete with the fancy varieties, but they require greater skill to have them in good character. I trust that Mr. Findlay will adopt this suggestion, or the danger is that the show Pansy will be quite crowded out by the fancy varieties. I have before me the schedule of prizes of the Norton Pansy Club, the exhibition of which took place on June 19. It is an entirely new organisation, and the schedule contains sixty-five classes. If the competition was as keen as at Manchester, the judges must have had a busy time of it. One regulation is worthy of notice, to the effect that "any stand of Pansies containing show blooms under 1½ inch in diameter, or fancy blooms under 1¼ inch in diameter, will be disqualified." This is done to ensure the presence of good-sized flowers, but one can understand what an onerous duty would be put upon the judges if they had to measure many Pansies apparently undersized. The beautiful fancy Pansies are now to be seen in almost every garden; but the show varieties have their claims upon growers also, and it is to be hoped they will not be suffered to fall away from cultivation through neglect. *R. D.*

Strawberry The Captain.—When we get any fruit or vegetable that is extra early or late it is a great acquisition to our list of good things. A few years ago we had an extra late and extra good Strawberry in Loxford Hall, now we have got two extra early in King of the Earlies and The Captain. I gathered the first of the former in the open ground on June 15, and the first of the latter on June 19, the quality and appearance of both of them being all that need be desired. The Captain is of an immense size. In my first batch of forced plants the King was not very satisfactory, in the second batch they were good in size and flavour, but the crop was not very good. I shall certainly give both kinds another trial as an early forcer, for being a week in advance of any other they are great acquisitions for very early forcing. *D. Walker.*

Abies Pinodrum.—It may not be generally known that two distinct kinds of leaves occur on the above tree—first, those, generally on young trees, which are thickly and regularly disposed on the branches, one inch long on the underside, by half that on the upper; some bind, and with two rather indistinct silvery lines beneath; 2d, those in adult trees, where the leaves are 2 inches to 2½ inches long, usually bind, and arranged in two rows horizontally. No. 1, to which Sir Joseph Hooker refers, was that figured in the *Gardener's Chronicle*, but I have sent to the Editor branches from the very tree that the cones figured were taken, in which both kinds of foliage are distinctly revealed. The true Pinodrum is here perfectly distinct at all stages of development from *A. Webbiana*. *A. D. Webster.*

I send inclosed a branch of a handsome specimen of this variety that I have growing in the pinetum here, and which I think will be found by me to be quite in accord with Sir J. Hooker's description of it in your last week's issue, and which I believe to be correctly named. There are a good many trees planted here, in different positions, but this is the only one that has made a good specimen. This is planted on high ground, and it is also very much protected by other trees, and so escapes the spring frosts. It is from 30 to 40 feet high, and well furnished with branches to the ground; the others of this variety are continually losing their leaders, and so have a stunted appearance. I also send a specimen of *Abies Webbiana* as grown here. *Edward Ward, Huxell Gardens, Bromsgrove.* [The specimen sent is from a sterile branch; the one figured was from a fertile branch, as mentioned in Mr. Webster's letter. *Ed.*]

Names of Fruits.—It must be puzzling to many who receive the catalogues of nurserymen, and other lists of fruits, to observe how varied the descriptions and names of the same are. It is of minor importance to purchase fruit trees and wait patiently perhaps for several seasons, and then to find the fruits quite different to what one desired or expected. It is, to say the least of it, tantalising. In the case of synonyms it seems difficult to conceive how some critics class fruits, and arrange their identity. It would appear to me, that they must not have seen the kind in its true character, or probably, they have not met with it at all. For example, take the Hamburg Grapes; they are changed in the descriptive lists very materially from what one was accustomed to observe in years gone by. I have old catalogues before me which I am inclined to trust, because I know the fruits were proved on the vendor's premises. Black Hamburg and Frankenthal are described in one list as the same kind, in another description they are said to be quite distinct. Victoria Hamburg is described as Dutch Hamburg, while Victoria is described as to the complete distinction of these kinds. The Victoria is represented as a superior sort, while the Dutch is described as coarse and third-rate. What I have (from my earliest recollections) supposed to be

Victoria Hamburg, is one of the coarsest and least palatable Grapes I know, and I have seen it awarded 1st prizes when the fruit was quite unfit for the most delicate dessert. I have always known the old Black Hamburg, Esperione and Champion Hamburg as being first-rate kinds and distinct in foliage, form of berry and flavour; but Hamburgs, under certain conditions, change their character very much. I have seen Esperione smooth and round one season, and quite hammered, like Victorias, the next (in the same viney and on the same Vines, too). Some preparations of liquid-manure are said to have a strong tendency to wash the hammered-looking surface. Abercainy Seedling I noticed is confounded with West's St. Peter's. The samples which I had from Mr. Brown, the successful gardener at Abercainy, were more unlike the true West's St. Peter's than any other black Grape with which I am acquainted. The berries of this Perthshire-raised Grape are more like Black Alicante than any kind I know of. Some fruit of this kind, which I had from another source, having been received from Abercainy many years ago, probably during the time the late excellent gardener, Mr. Arnott (the raiser), had charge of Abercainy Gardens, and seemed much like the fruit I received from Mr. Brown two years ago; flavour, perhaps, less sugary. The names and descriptions of Muscats are perplexing in some catalogues. We know three kinds of Muscats as being quite distinct—Muscato Alexandria, Canon Hall, and Bowwood. I notice one authority describing the Canon Hall as having "better bunches." I would go a long distance to see better set bunches of this kind—as it is rarely met with more than half set—but sometimes seen in prime condition, and is really a sight worthy of record. Bowwood Muscat, I notice, is described as being the same kind as Muscato Alexandria. Our experience is, that it sets as freely as a Hamburg. The berries are larger, earlier, and of deeper colour than the Muscato Alexandria. I thought when I first saw this kind of Bowwood (I was then an underling in that part of Wilts) that it was most valuable acquisition, and I think so still. It is seldom that it can be purchased true, but when it is obtained, and the bunches and berries in good condition, will be found to resemble very strongly the plate issued in the *Pomologist* many years ago. I have had it in my culture in several vineyards, but more than once tried to buy it, and received Muscato Alexandria instead. It is properly described in a catalogue of Mr. Rivers' dated 1877. I once had the strongest reasons to value its free setting qualities and other good characteristics. At Impney Park, Worcestershire (a place where I was entrusted to form a new park, gardens, &c., under the supervision of Mr. McCormack), the Vines were ordered before my arrival on the ground, and I was pleased to find in a choice selection Bowwood Muscat, and it proved to be the kind which I had longed in vain for years to see. The cones were planted, but shortly afterwards I was instructed to fruit the young and newly planted Vines to give a supply the first year, and the Vines intended to be the permanent stock were made "superumeraries," and went through a severe ordeal, the Bowwood Muscat standing the severe treatment among the best. In 1881 a notice of these gardens, Grapes and their cultivation, was given in the *Gardener's Chronicle*, October p. 47, and the Bowwood Muscat was conspicuous and noticeable to the most casual observer, the large yellow berries being very prominent alongside of fine Muscats of Alexandria. The descriptions given by vendors of fruits in their lists are far from being reliable, and many are at variance with each other in their opinion. *M. Temple, Carron House.*

A Novel Plant House.—Mr. J. Goddard, of Falham, the inventor of the useful patent adjustable "clip," designed to hold together two or more pieces of glass, slates, or other suitable material to form a protection from sun, wind, &c., and therefore very useful in the striking of cuttings and a thousand other uses amongst lights and so on, has designed what may not be inappropriately termed a novel and useful plant house, inasmuch as it will meet the wants of a large class. There are thousands of houses with low garden walls from 4 feet to 5 feet high, the occupiers of which would like to have the means of growing or preserving flowers or plants without going to the expense of raising the wall, and who object to plant frames. The house in question is specially adapted for such garden walls. It is made from 4 feet to 6 feet high, about 7 feet wide, and a little over 2 feet from front to back; the roof is made to take off, so that it can be used as a hand-light in the garden or on a frame. The glass is very readily removed or replaced being held in position by the "clips." No door is required, as any square of glass in the front or ends can be taken out to get at the contents of the house, and replaced again in one minute, as it is held by a screw knob and clip. If the house be sent a distance, the packing case is made to be utilised as a frame for the roof of the house, so that the packing-

case in this instance does not meet with the fate in store for packing-cases generally, which are stowed away, and become eyecores and nuisances. *B.*

Araucarias Coning.—Many of your readers will doubtless remember a fine Araucaria in my lawn. It is now about 45 feet high, and is probably one of the most perfect specimens in the kingdom. Last year, for the first time, it bore a profusion of male cones on the upper branches, and this year it has borne a further quantity, but only on the south side, and in bunches of two, three, and four on the upper terminal boughs. On the morning of the 4th ult. a singular circumstance occurred which is worth reporting. My attention was called to "smoke" coming from the cones. Upon looking up I saw that the cones were discharging pollen in a regular systematic manner, and so profuse as to resemble a good puff of smoke from a cigar or pipe. The display continued nearly the whole day at intervals of about a minute, and was watched with considerable interest by a succession of visitors. The weather was warm and bright, with little or no wind, and so was the next day, but no further display took place. After each puff of pollen it disappeared, and was doubtless wafted to immense distances. The cones before discharging the pollen appeared of an inconspicuous green colour, and after a very conspicuous brown. I enclose a sample for your inspection, and please note their curious formation. The four formed one bunch. *W. H. Rogers, Southampton.*

Astrantia maxima.—So far as my knowledge goes this appears to be a very rare plant in our gardens, and I am not aware of any nurseryman's catalogue of hardy plants in which it occurs for sale. The Astrantia does not seem to be either collected or passed over as worthless, but I consider them both beautiful and interesting plants, if a suitable situation can be found for them in a shady place or in a woodland walk. The ordinary Astrantia major has green flowers, and is not a striking plant, but *A. maxima* has pinkish flowers and a deep purple centre, and is certainly a beautiful plant either for the border or the wild garden. I send herewith flowers of both these varieties for your opinion or conceal. My stock each of them came originally from the wreck of the Longford Bridge Garden, where a grand collection of hardy plants was got together by the late Edward Leeds. *Astrantia maxima* is figured in the *Botanical Magazine*, No. 1553, in the year 1813. It appears to have been named *A. maxima*, by Pallas, in 1790, and was grown by the Loddiges from seeds sent from the Caucasus. It occurs in Aiton's *Hortus Kewensis* as *A. helioborifolia*, a name which had been given to it by Salisbury, in his *Parthenus Londinensis*; but the proper name is *A. maxima*, the English name the Helio-bore-leaved Astrantia. All collectors of hardy plants should endeavour to obtain this plant, as its rosy coloured flowers are very pretty, and it is most useful for floral decoration, the tall sprays lasting many days in water. *Wm. Brockbank, Brockhurst, Didsbury.*

Double Chinese Pæonies.—The wonderful beauty of both colour and form to be found in this group of late flowering Pæonies may make a few notes of use as to some of the many kinds worth growing. Mr. Walker of Whitton, has made a careful selection of them, both from home and foreign collections. He finds the confusion amongst their names equals that amongst Narcissi. If some "central authority," such as the Narcissus Committee, would take them in hand, it would save many a disappointment to the growers of these fine flowers. At first sight, the large piece of ground devoted to them at Whitton looks like a garden of Roses, from white to deepest crimson in colour; but without venturing into the Queen of Flowers, these Pæonies have a singular beauty of their own, not less striking in the ball-opens smaller blossoms and globular buds than in the soft masses of varied colour to be seen in the large full-blown flower. The following kinds are named from Mr. Walker's collection. Perhaps the loveliest of all is a semi-double, bluish white with a centre of golden stamens, called *P. anemoneiflora* (but quite distinct from the early Pæony also called anemoneiflora.) *Duchesse de Nemours*, white shading into a canary centre; *Caroline Allain*, pale pink shading into pale yellow; *Moderne*, bluish with pale yellow centre; *Viscomtesse de Ballart*, pink shading to cream; *Princess Galitzin*, Marie Jacquin, bluish; *Princess Nicholas Bibix*, pink, outer petals with yellowish-white small petals round the centre, which is pink; and *Canary*, creamy-white shading to sulphur; *Professor Morez*, shaded pink; *Alfred de Julvecourt* and *Pulcherrima*, resembling the *Rose Souvenir de la Malmaison* in colour; *Auguste Mielley*, pale pink; and *Maxima*, white with a small patch of red in the centre (a beautiful flower); *P. Whiteley fl.-pl.*, large globular white with pale pink outer petals; *Louis Parmentier*, nearly white, a very late kind; *Maria Lemoine*, a very good white, also late flowering; and amongst darker shades, *Duchesse de Thèba* and

Auguste d'Hour, dark crimson; Zôé, bright rose, full and globular in form; and Madame Munier, deep rose. Any or all these Fæonies would be a valuable addition to the beauty of every garden in which they are not already grown. *C. M. Owen.*

Penstemonides.—In discussing the origin of the florist's section of the genus *Penstemon*, your usually well-informed correspondent, F. Douglas, seems for once to have gone very wide of the mark (see vol. xv., p. 754). I imagined that every horticulturist of note was well aware that the bedding *Penstemon* of the present day are lineal descendants of the *P. Hartwegii*, Benth., introduced some forty years since, and well represented at L. 3661, vol. lxx. of the *Botanical Magazine*, under the erroneous name of *P. gentianoides*. The true species of the latter name having been subsequently introduced, the former was re-christened by the name it now bears. Possibly these two species, to neither of which Mr. Douglas alludes, may jointly have originated the present race of *Penstemon*s, employed with such good effect as bedding and border plants; but it is quite as probable that they are the progeny of the *P. Hartwegii* alone, as a comparison of any variety with the coloured illustration above referred to will show no greater departure from the type than can easily be accounted for by forty years of cultivation and selection. That either *P. speciosus*, or any of the other forms of *P. glaber*, have had any share in the production of the plants under discussion there is not a tittle of evidence that I am aware of, and those who are best acquainted with these species will doubtless agree with me that it is very improbable. At the same time I am far from refusing to believe in the possibility of obtaining a hybrid of the *P. Hartwegii* with one or other of the *gentianoides* section, but I venture to hazard the opinion that a successful cross would give plants very distinct from those at present cultivated. Let me add that the *P. Jaffrayanus* alluded to amongst other species is certainly inferior as a garden plant to the best forms of *P. heterophyllus*, the flowers of which are of a lovely sky-blue. It is readily raised from seed, and selected varieties can, if desired, be as easily increased by cuttings. When plants of uniform size and strength a most charming bed may be arranged by any intelligent gardener. *Sixante.*

Cucumbers Diseased (pp. 768, 797, vol. xv.)—The case of young Cucumbers dying from the tips downwards, is probably familiar to too many gardeners. The accompanying illustration (fig. 12) taken from examples of the dying ends of Cucumbers observed by me at different times, probably shows the ailment referred to. The plants may possibly have been thrown out of health by treatment similar to that mentioned by "C. D." However this may be, the dying ends of the diseased Cucumbers swarm with fungus threads and colourless fungus spores. The spores are shown enlarged 400 diameters in the middle of the illustration. I take the bodies illustrated to be the buds or spores of *Gleosporium laticolor* (illustrated on p. 796), or a closely allied species which grows in and on Melons, Gourds, and Cucumbers. As the ends of the Cucumbers soften and decay a white mould often covers the perished end; this mould does not belong to *Gleosporium*, but is *Eolyacis vulgaris*, illustrated in the *Gardener's Chronicle* for February 8, 1885. It seems probable that the conditions mentioned by "C. D., p. 797, may encourage the growth of these fungi. The spores, of course, when living under favourable conditions are able to continue the disease, and they no doubt often swarm in *Cucumber-houses*, *Melon-pits*, *vineeries*, and *orchard-houses*. Good

specific good blooms of Madame G. Luizet, Victor Verdier, and Marie van Houtte; Messrs. Keynes, Williams & Co. were 3d.

The next class was twenty-four varieties of H.P.'s in threes. There was good competition here, all the exhibitors in the class showing uniformly fine blooms. Mr. C. Turner, Slough, showed the best collection, the best varieties being Mons. Noman, Lady M. Fitzwilliam, Madame G. Luizet, and Duke of Wellington; Messrs. Cooling & Sons, Bath, were next in merit, with Merveille de Lyon, A. K. Williams, Francis Michelon, and Prince Arthur as their best blooms.

For twenty-four varieties, distinct, in single trusses, Mr. G. Prince, 14, Market Street, Oxford, secured the 1st place in a good competition, having fine specimens of Princess of Wales, Lady M. Fitzwilliam, Madame Cusin, Maréchal Niel, and Madame G. Luizet. Mr. C. Turner, Slough, was 2d, with Merveille de Lyon, Xavier Olbio, Maréchal Niel, and Souvenir d'Elise Vardon; 3d, Mr. G. Mount, Canterbury.

The tea-scented and Noisette Roses were numerous and on the whole very fine, and they appeared to find great favour with the visitors. The best eighteen varieties, three trusses of each, came from Mr. George Prince, nurseryman, Oxford, who had fine examples of Alba rosea, Francisca Kruger, La Boule d'Or, Niphetos, Princess of Wales, Catherine Mermet, Jean Ducher, Marie van Houtte, Souvenir d'Elise Vardon, Anna Olivier, Innocenta Pirola, Madame Hippolyte Jamin, Hoze, Edith Giffard, and Amazone; 2d, Mr. G. W. Piper, nurseryman, Uckfield, with admirable flowers of Souvenir d'Elise Vardon, Marie van Houtte, Jean Ducher, Comtesse de Nadaillac, Anna Olivier, Niphetos, Jean Pernet, Etoile de Lyon, and Catherine Mermet; 3d, Mr. C. Turner.

Then followed a series of classes for Roses in colours, but as the collections were unlimited in extent some showed a greater quantity of flowers than others. The best collection of yellow Roses, three trusses of each, came from Mr. Geo. Prince, all of them being tea-scented, and included fine blooms of Jean Ducher, Princess of Wales, Francisca Kruger, Etoile de Lyon, Comtesse de Nadaillac, Perle des Jardins, Madame C. Kuster, Marie van Houtte, and Amazone; 2d, Mr. J. Mattock, nurseryman, Oxford, who had Comtesse de Nadaillac, Jean Ducher, Marie van Houtte, Anna Olivier, Boule d'Or, and Belle Lyonnaise; 3d, Mr. B. R. Cant.

Next came a collection of white Roses, three trusses of each, and here Mr. B. R. Cant was 1st, with a superb lot, comprising Edith Giffard, Niphetos, Devoniensis, Innocenta Pirola, Madame Lacharme, very fine, and Madame Bravy; 2d, Mr. G. Prince, with Edith Giffard, Anna Olivier, Alba rosea, Niphetos, Innocenta Pirola, &c., also very good; 3d, Mr. G. W. Piper.

Messrs. Paul & Son had the best collection of pink Roses, staging a very fine lot, comprising Mad. G. Luizet, Marguerite de St. Amand, Madame Montels, Madame Hippolyte Jamin, Mons. Noman, Pride of Waltham, Baroness Rothschild, Catherine Souper, Princess Beatrice, Julia Touvais, Lady Mary Fitzwilliam, Marie Finger, Duchesse de Valombrosa, Madame Cusin, Souvenir d'un Ami, and Catherine Mermet; 2d, Mr. B. R. Cant, with very fine blooms of Madame Cusin, Marguerite de St. Amand, Mons. Noman, Lady Mary Fitzwilliam, Mad. Gabriel Luizet, and Duchesse de Valombrosa; 3d, Messrs. J. Burrell & Co., Cambridge.

Messrs. Paul & Son had the best collection of crimson Roses, staging fine blooms of A. K. Williams, Duke of Edinburgh, Dr. Andy, Mons. E. Y. Teas, Gen. Jacqueminot, Duke of Teck, Ulrich Brunner, Comte Rumbaud, Marie Rady, Marie Baumann, Madame Victor Verdier, and Camille Bernardin; 2d, Mr. B. R. Cant, with A. K. Williams, Fisher Holmes, Charles Lefebvre, Dr. Sewell, Marie Baumann, Gen. Jacqueminot; 3d, Geo. Christy, Esq., Westerham.

Mr. R. B. Cant was 1st with a collection of velvety crimson Roses, having Duke of Edinburgh, Fisher Holmes, Prince Arthur, Duke of Marlborough, Dr. Sewell and Maurice Bernardin; 2d, Messrs. Paul & Son, with Louis van Houtte, Prince Arthur, Reynolds Hole, Charles Darwin, Prince Camille de Rohan, &c.; 3d, Messrs. Geo. Bunyard & Co.

Mr. B. R. Cant had the best eighteen trusses of Maréchal Niel, Mr. Geo. Mount, St. Dunstan's, Canterbury, being 2d.

In the class for the same number of trusses of any Tea or Noisette Rose, Mr. B. R. Cant was again 1st, with a superb lot of Souvenir d'Elise; Mr. W. J. Grant, Hope End Farm, Ledbury, being 2d, with Marie van Houtte, and Mr. Prince 3d, with a superb lot of Comtesse de Nadaillac.

In the class for eighteen trusses of Marie Baumann or similar coloured Rose, Messrs. Keynes & Co. were 1st, with Ferdinando de Lesseps; Mr. B. R. Cant 2d, with Marie Baumann; and Messrs. Bunyard & Co. 3d, with the same. The best eighteen trusses of Prince Camille de Rohan, or other Rose of similar colour, came from

FIG. 12.—TIPS OF DISEASED CUCUMBERS: NATURAL SIZE; With fungus spores enlarged 400 diam.

A Work on Colour.—What a boon it would be to those not "up" in colours, if some authoritative book were published descriptive of colours. Such a diversity is presented in Queen Flora's charming dominion! The visitor at a flower show must be often puzzled to "hit off" exactly the colour of some object which is there displayed for his admiration. For instance, take only a flower which claimed notoriety at the recent Conference and the day which is kept sacred to the memory of an illustrious statesman—a refer, of course, to the Primrose.

The range of tints to be found in this one popular flower is, indeed, astonishing—from pure white, and the most delicate shades, running to rich gold, orange, bright or deep red, maroon, crimson, or purple. But to return to the work in question. Supposing that some alphabet of colours with their shades were prepared, what a source of satisfaction it would be to the search of such information—useful, too, to reporters of the horticultural Press, who must be often at their wits' end to adequately describe the subjects continually coming under their notice—one representative of the fourth estate giving it as one, and his companion of the pen another colour. No two people agree in this matter. To instance what we mean—supposing blue, with its various shades (to take a common example) is the colour in question, for which reference would be made in the book, under the heading of blue, the illustration of the colour, and the description of it and its shades. We throw out these very crude ideas for what they may be worth, and if any one learned in colour can be induced to take this important matter up these rambling remarks will not have been written in vain. *B.*

A Fine Begonia.—Now that the tuberous-rooted Begonias are popular in gardens it might be interesting and encouraging to growers to place on record the successes of Mr. Mitchell, the gardener at Tehidy Park, Camborne, Cornwall. Some eight years ago he added to his fine collection a plant of that good single flowered variety, Madame Oscar Lamarche, and he has grown and preserved the same tuber ever since. The result is that he has the finest specimen that has ever come under my notice, and just now it is the pink of perfection—a mass of glowing orange-red flowers—so clustered are they on every side that the handsome foliage is almost hidden from view. This extra-early flower is found in growing in a 2½ in. pot, and the tuber is over 15 inches in diameter, while the height of the plant from the top of the pot ranges from 3 to 4 feet, and it is quite 5 feet wide. *W. Napier, Alphington Cross, July 3.*

ventilation—as opposed to warm, moist, stagnant air—would probably have a beneficial effect on the growth of ailing *Cucumber* plants. *W. G. S.*

Reports of Societies.

CRYSTAL PALACE: July 3.

THE ROSE Show of the Crystal Palace Company was a decidedly good one, there being keen competition in most of the classes, and almost every prize offered was awarded. The blooms of the Roses were very nice, and when the condition of the season is considered good. The tables on which the boxes were placed had been separated and spotted all over the body of the Palace, the leading classes occupying the centre transept, and consequently plenty of room was allowed for the visitors. This was as well for the attendance was numerous, great interest being shown in the flowers.

Mr. B. R. Cant, Colchester, stood 1st in a keen competition for seventy-two varieties, distinct, single trusses, with a collection of handsome blooms, which fully merited their prize. The varieties were so arranged that their colours blended and balanced each other. Some of the best examples were Duke of Connaught, Merveille de Lyon, Madame de Watteville, Général Jacqueminot, Innocenta Pirola, Lord Macaulay, Victor Hugo, Maréchal Niel, Marie Finger, Pitoua, Madame Lambert, Madame Ch. Maurice, Marguerite de Romaine, and Duchess of Bedford; 2d, Messrs. Paul & Son, Old Nurseries, Cheshunt, who followed very closely with, among others, S. Reynolds Hole, Julia Touvais, A. K. Williams, Duke of Edinburgh, Souvenir d'Elise Vardon, Alba rosea, and Souvenir d'un Ami; 3d, Mr. F. Cant, Colchester.

With forty-eight varieties, distinct, three trusses of each, Mr. B. R. Cant was again 1st; and Messrs. Paul & Son 2d, with almost the same blooms as were shown in the seventy-two varieties. Specially fine examples of Baroness Rothschild, Duke of Wellington, and Madame de Watteville being included in the 1st prize lot; while Messrs. Paul & Son showed

Messrs. Paul & Son, who had Abel Carrière; 21, Messrs. Keynce & Co., with Xavier Olibo; 21, Mr. R. B. Cant, with Fisher Holmes.

Mr. W. J. Grant had the best eighteen trusses of François Michelon, of similar colour, staging Marquis de Castellane; the Cranston Seed and Nursery Company were 21 with François Michelon; Mr. B. R. Cant being 31 with John Hopper.

The best eighteen blooms of Lady Mary Fitzwilliam, a similar colour, brought some exquisite blooms of this lovely Rose from Mr. H. Bennett, the raiser; Mr. B. R. Cant being 21; and Mr. T. W. Guildstone, Sunningdale, 21, with the same.

Mr. G. Prince had the best eighteen trusses of A. K. Williams; Mr. W. J. Grant being 21; and Messrs. Paul & Son, 31.

Mr. Prince had the best eighteen trusses of W. A. Richardson, showing it richly coloured; Mr. W. J. Grant was 21; and Messrs. Paul & Son, 31.

The Rev. J. H. Pemberton, Knafoord, had the best eighteen trusses of Niphotos; Mr. Geo. Prince being 21; and Mr. E. T. Atherton, Clatteris, 31.

Messrs. Paul & Son had the best twelve bunches of Rosa polyantha, showing nice specimens of Madame Paquerette, Perle d'Or, Simplex, Mignonette, and Anna Maria Montravel; Mr. G. Prince was 24, having, distinct from the foregoing, Cecil Brunner.

Messrs. G. Cooling & Son had the best examples of Rosa rugosa, staging good bunches of the red and white forms; Messrs. G. Banyard & Co. being 21.

In the amateurs' division there was as good a show as in the open classes, but the competition in some classes was not very large, still it was large enough to cause all the prizes to be awarded. On the whole this division was remarkably fine, good blooms being the rule.

For forty-eight varieties, one of each, W. J. Grant, Esq., Hope End Farm, Leighton, was 1st, Horace Verret, Sultan Osman, Madame G. Luizet, and Duke of Edinburgh, being the most remarkable specimens; 2d, Mr. G. Campbell, gr. to S. P. Badd, Esq., S. Gay Street, Bath, including Baroness Rothschild, La France, Pride of Waltham, Prince Camille de Rohan.

In the class for twenty-four varieties, distinct, H. P.'s, one truss of each, there was a fine exhibition of uniformly good blooms, the judges considering it right to award an extra 31.

Mr. J. Ridout, gr. to T. B. Haywood, Woodhatch Lodge, Reigate, was 1st, with Mrs. Baker, François Michelon, A. K. Williams, Madame Lachrome, F. de Lesseps, and Madame Nonan; 2d, R. E. West, Esq., Reigate, having Ulrich Brunner, Merveille de Lyon, Abel Carrière, Etienne Levet, and Madame G. Luizet; 3d, Mr. R. Gray, gr. to Earl Stanhope, Chevening, Sevenoaks; and extra 31, G. Christy, Esq., Buckhurst Lodge, Westerham.

With twenty-four varieties, three trusses of each, T. B. Haywood, Esq., was 1st, with good blooms of J. S. Mill, La France, Madame Victor Verdier, Marquis de Castellane, A. K. Williams, Marie van Houtte, Alfred Colomb, François Michelon, Marie Finger, Myrlande Licharme, and Lady Mary Fitzwilliam; W. J. Grant, Esq., was 2d, having Lady Mary Fitzwilliam, Horace Verret, Charles Letebvre, La Rosette, Beauty of Waltham, &c.

Mr. Jas. Brown, gr. to A. J. Waterlow, Esq., Rainham, was 1st, with twelve varieties, having good flowers of La Havre, Lady Mary Fitzwilliam, A. K. Williams, La France, Marquis de Castellane, Madame G. Luizet, Pride of Reigate, charmingly striped; Merveille de Lyon, Countess of Rosebery, Pride of Waltham, Eugene Furst, &c.; 2d, J. L. Curtis, Esq., Clatham.

The Rev. Dr. King, Madingley Vicarage, Camb., had the best twelve Tea and Noisette Roses, having Catherine Mermet, Marie van Houtte, Souvenir d'Elise Vardon, Madame Cusin, Innocente Pirota, Souvenir de Paul Neron, Princess of Wales, Marchal Niel, Jean Ducher, and Souvenir d'un Ami; 2d, Rev. J. H. Pemberton, with a very good lot, running the 1st somewhat hard.

SEEDLING ROSES.

Mr. H. Bennett had Viscountess Folkestone, a fragrant blush coloured variety, with a warm flesh centre; Messrs. William Paul & Son had Grand Mogul, a crimson A. K. Williams, and Silver Truce, silver-white, with deep flesh centre.

CARNATIONS, PICOTEES, AND PINKS.

Mr. C. Turner had the best twelve Carnations, staging good blooms of Illuminator, A. K. Mayor, Charles Turner, John Keel, Outsider, a good scarlet-flake; Mrs. MacLaren, Figaro, Miss E. Wenys, and Three Cloves; 2d, Mr. James Douglas, Great Gearies, Hford, with seedlings. Mr. Douglas had the best twelve Picotees, showing mainly yellow ground seedlings; Mr. C. Turner being 2d with Clara Penion, Evelyn, William Summers, Mrs. Radd, Chanticleer, &c. Mr. Henry Hopper, nurseryman, Bath, had the best twelve Pinks, showing very large flowers of Ne Plus Ultra, Henry Cannell, Boyard, Brilliant, Eclipse, W. Paul, &c.; 2d, Mr. H. Cattley, Bath.

Special prizes were offered by Messrs. Paul & Son, nurserymen, Waltham Cross, for a collection of flowers introduced from or raised at the Waltham Cross Nurseries; one collection only put in appearance, and that of an inferior character.

GROUP OF TUBEROUS BEGONIAS.

In this class Messrs. J. Ling & Co., Forest Hill, were the only exhibitors. They were awarded the 1st prize for a group occupying about 144 square feet. The group formed a square pyramid, and was relieved with Caladiums, Palms, Ferns, Mosses, &c., which relieved the blaze of colours from the bloom of the Begonias.

MISCELLANEOUS.

Messrs. W. Paul & Son, Waltham Cross, contributed a fine group of Roses, which were arranged in a tasteful manner in front of the stage. Numerous varieties were shown, and samples of almost every sort separated by Adiantum. Pots of Roses were studied here and there, and at both ends and forming a line at the back were ornamental standard baskets and standard Roses in pots. The following were included in this group—Lady Mary Fitzwilliam, Captain Christy, Violette Dwyer, Ma Capucine, Madame Falcor, Anna Olivier, &c., and two new ones—Grand Mogul and Silver Queen.

E. Holman, Esq., Kockhills, Crystal Palace Park, exhibited six pots of Petunias, which were well flowered and of good appearance.

Mr. P. Perry, gr. to W. G. Rowlett, Esq., showed some pots of Carnation Magnificence, full of bloom of delicate rose-salmon colour—very attractive.

Messrs. J. Chel & Son, Crawley, Sussex, contributed a nice little collection of herbaceous flowers, having Cnothera Youngii, Spiræa (several vars.), Phlox (vars.), &c.; also they showed a group of Roses, R. rugosa vars., the Moss Rose and Provence, as well as Teas, &c.

NATIONAL ROSE SOCIETY'S SHOW : Tuesday, July 6.

The annual meeting of this Society took place in the conservatory of the Royal Horticultural Society at South Kensington.

The flowers were quite as numerous as on any former occasion, but the quality of the blooms had suffered much from late frosts, and yet more from the great warmth experienced for the last week in England. Many of the flowers were found with damaged or open centres, and almost all were under-sized. New Roses were shown in a few instances, but there was nothing remarkable to be found in any of those exhibited, and they were of poor quality generally.

As the competitors in the smaller classes were, as usual, in good numbers; but the entries in the classes for seventy-two, forty-eight, and twenty-four, were fewer, and were those whom we always expect to see head the lists of prize winners at this and other large gatherings of Rose growers. The day was exceedingly warm, so that the blooms soon after being set up, showed signs of distress, and by the evening many flowers were spoilt.

NURSEYMEN.

Seventy-two, distinct, single trusses.—In this class Mr. B. R. Cant, nurseryman, Colchester, took the 1st prize, with a lot of fairly even flowers of H. P.'s, amongst them being fine blooms of Baldeau, Lord Macaulay, Duke of Connaught, Beauty of Waltham, Duke of Wellington, La France, Ariadne, Marie Verdier, A. K. Williams. Of Teas were Souvenir d'Elise Vardon, Devoniansis, Marie van Houtte, La Boule d'Or, and Innocente Pirota.

The two Silver Medals in the nurserymen's classes for the best H. P. and the best Tea were awarded to a blocca of Baldeau, H. P., and to Souvenir d'Elise, Tea, in this stand, 2d, Mr. F. Cant, Colchester, with a good stand, his best flowers being Mrs. Jowitt, Marchal Niel, Anna Olivier, La Havre, and Horace Verret; 3d, Messrs. Paul & Son, The Old Nurseries, Chesham; 4th, Mr. C. Turner, Slough.

Forty-eight distinct, three trusses of each.—The 1st prize was again taken by Mr. B. R. Cant, who showed a stand in which were excellent examples of Lady M. Fitzwilliam, Dr. Sewell, Fisher Holmes, Ulrich Brunner, Horace Verret, Marquis de Castellane, Niphotos, and Souvenir d'un Ami. A good 2d was seen in Mr. C. Turner's stand, who put up a bright fresh collection of flowers, conspicuous examples being observed in Catherine Mermet, Horace Verret, Countess of Rosebery, Reynolds Hole, Abel Carrière, Beauty of Waltham, and Alba Rosa. The 3d prize went to a stand in which were excellent examples of Lady Mary Fitzwilliam, Senator, Visse, Marie Rady, and Alfred Colomb were very superior. The fourth prize was awarded to the Cranston Seed and Nursery Company, Hereford.

Twenty-four Teas or Noisettes (distinct), single

trusses.—In this class the 1st prize was well taken by Mr. G. Prince, Oxford, with a beautiful stand, the best of which were Countess de Nadailles, Souvenir d'Elise Vardon, Etoile de Lyon, Rubens, Amazone, and Madame Willemer; 2d, Mr. F. Cant, 21, showing excellently; Mr. B. Cant, taking the 3d prize.

Forty-eight single trusses (distinct).—Messrs Curtis, Sandford & Co., Torquay, were the winners of the 1st prize, with one of the best collections in the show, very good flowers being observed in Madame S. de Laplace, Lord Macaulay, E. Y. Teas, Captain Christy, Marie Rady, and Xavier Olibo; 2d, Messrs. J. Barrett & Co., Clatteris, who showed a good lot of blooms in a very fresh condition, the finest being Mutrice Bernardin, Beauty of Waltham, A. K. Williams, François Michelon, and Madame Watteville; 3d, Messrs. Cooling & Sons, Bath; 4th, Messrs. J. Jeffries & Son, Cirencester.

Twenty-four, distinct, three trusses of each.—In this class Messrs. Curtis, Sandford & Co. took the lead with an excellent collection. We observed very fine examples of Madame G. Luizet, Lord Macaulay, Duke of Wellington, Baroness Rothschild, Marie Rady, and Jean Ducher. 2d, Messrs. Jeffries & Son, who in a nice stand had fine flowers of Lady M. Fitzwilliam, Annie Lixton, Duchesse de Valombrose, Queen of Queens, and La France; 3d, Messrs. Cooling & Son, who showed remarkably well; 4th, Messrs. Barrell & Co.

Twenty-four, distinct, single trusses.—Mr. G. Mount, the Rose Nurseries, Canterbury, was here the winner of the 1st prize, having fine examples of Lady M. Fitzwilliam, Lord Herbert, Dr. A. J. Barry, Marchal Niel, Captain Christy, and A. K. Williams; 2d, Messrs. Harkness & Sons, Badale, Yorkshire; 3d, Mr. T. Banyard, Ashford, Kent.

Eighteen Teas or Noisettes, distinct, single trusses.—1st, J. Mattock, New Headington, Oxon, whose flowers were very meritorious; 2d, Messrs. J. Barrell & Co.; 3d, Mr. G. Mount.

AMATEURS.

Forty-eight single trusses, distinct.—The 1st prize and Challenge Trophy were taken by the Rev. Joseph H. Pemberton, Hvering, Reigate. The Silver Medal for the best flower for the best flower in the show, A. K. Williams, a superbly finished fresh bloom, fell likewise to this exhibitor. Amongst his very fine examples were François Michelon, Magna Charta, Mlle. Marie Court, Horace Verret, Etienne Levet, Louis van Houtte, Duke of Wellington, Countess of Rosebery, Souvenir d'Elise Vardon, and a grand Alphonse Saucer. 2d, W. G. Grant, Esq., Hope End Farm, Leighton, the best in this stand, being Louis van Houtte, Constantine Trefenkoff, Le Havre, and John S. Mill; 3d, E. B. Haywood, Esq., Woodhatch Lodge, Reigate (gr. Mr. Ridout)—Marquis de Castellane and Ferd. de Lesseps were very nice blooms; 4th, S. P. Badd, Esq., S. Gay Street, Bath. There were nine competitors in this class.

Twenty-four, distinct, single trusses.—1st, Mr. R. Gray, gr. to the Earl of Stanhope, Chevening Park, who staged a very beautiful lot of evenly matched blooms, bright colours predominating—Paul Jamain, A. K. Williams, Horace Verret, Xavier Olibo, Etienne Levet, Camille Bernardin, La France, and Marchal Niel being the best of them. 2d, G. Christy, Esq., Buckhurst Lodge, Westerham—Marie Rady, Abel Carrière, Madame Licharme, and Mrs. Newell, a fine dark Rose, being the best. 3d, E. M. Bethune, Esq., Denne Place, Horsham (gr. Mr. H. Harris); 4th, Mr. Gurney Fowler, Woodford, Essex. Four lots were shown.

Twelve, distinct, three trusses of each.—1st, Rev. J. H. Pemberton, with flowers of a medium size, but of generally perfect form; the best being seen in Mlle. Marie Cointet, A. K. Williams, Marquis de Castellane, Charles Lesfèvre, Niphotos, Marie Baumann, Catherine Mermet, Beauty of Waltham, Madame G. Luizet, and Horace Verret. Equal 1st, W. J. Grant, with blooms of good substance and form. H. Verret, François Michelon, Marie Rady, Beauty of Waltham, Général Jacquemont, and Le Havre, being the finest. 3d, T. E. Hall, Esq., Larchwood, Rockferry—the flowers being rather small—Charles Lesfèvre, Dupuy Jamain, Violette Bower, Monsieur Nonan, Captain Christy, Madame Hippolite Jamain, being the best. Equal 3d, E. W. Giddestone, Sunningdale, Berks, with flowers unequal in size and punished by the heat—Prince Arthur, Marie Baumann, Caroline Kuster, were good examples. There were eight competitors.

Eighteen Teas or Noisettes, distinct, single trusses.—1st, Rev. Dr. E. G. King, Madingley Vicarage, Cambridge, and winner of the National Rose Society's Silver Medal for the best Tea or Noisette, with Souvenir d'Elise Vardon. Other fine examples were seen in Catherine Mermet, Senet, Anna Olivier, Souvenir d'un Ami, Niphotos, Marchal Niel, Caroline Kuster, and David Prædel. 2d, Rev. J. H. Pemberton, who had but few really first-class blooms—Madame Bravy, Marie van Houtte, Belle Lyonnaise, and Bonquet d'Or being the finest; 3d, E. M.

Bathone, Esq., small blooms, several being still in the unopened state. There were seven entries.

Thirty-six, distinct, single trusses.—1st, Mr. Brown, gr. to E. Waterlow, Esq., Great Doods, Reigate. His blooms looked fresh, and of a colour, even eye and medium size, well contrasted in colour, the finest being A. K. Williams, Lady M. Fitzwilliam, Marie Baumann, Reynold's Hole, M. Noman, Charles Darwin, Merveille de Lyon, and Marie Rady. 2, F. Wade, Esq., Emsbam Hill, West Farleigh, some fine examples being observed in his M. Niel, Marie Baumann, M. Noman, E. Lovet, Belle Lyonnaise. 3, Mr. E. Mitchell, Gubens, Corbetstaple, Romford, in which, among some fine blooms, were others with fully centring.

Eight distinct, three trusses of each.—1st, Mr. Brown, Great Doods, rather small, but perfect flowers as regards the major number: Etiole de Lyon, Eugene Fürst, Marie Rady, and Merveille de Lyon being the finest; 3, Mr. E. H. Fellows, Wimpole Rectory, Royston; 4th, F. Ward.

Eighteen, distinct, single trusses.—1st, Mr. E. H. Landsell, Barton, Hitchin—the examples of Nivier Olivo, Lord Macaulay, Baroness de Rothschild, Madame G. Luizet, Marie Baumann, being the best flowers; 2, Rev. L. Garnet, Christleton, Chester—fresh looking, but comprising some imperfect blooms—Comtesse de Nadaillac, La France, and Le Havre, being the best examples. 3, Miss Baker, Holmfels, Reigate (gr. Mr. J. Badgen)—Ulrich Brunner, Horace Verret, and E. Lovet, were the finest blooms; 4th, Mr. W. H. Wakley, Mackland, Ringham. There were eight entries.

Two Teas, Noisettes, distinct, single trusses.—1st, E. Claxton, Esq., The Rosery, Allerton, Liverpool a lot of small blooms, evenly matched, and not over-blown as some were. The examples of Caroline Kuster, Madame Willermoz, M. H. Jamin, Princess of Wales and Jean Dicher, were very nice. 2, E. Waterlow, Esq.: Etiole de Lyon, Alba rosea and Catherine Mermet being very fine. 3, Rev. L. Garnet—in this lot the blooms of Comtesse de Nadaillac, Madame Cusin and Souvenir d'un Ami were very good ones. 4th, E. B. Lindsell. There were eight competitors.

Eighteen, distinct single trusses.—1st, E. Mawley, Esq., Rose Bank, Berkhamstead—the finest of the flowers being seen in Captain Christie, Souvenir d'Elise Vardon, Henri Ledecheux, Chrys Lefebvre Le Havre, Nivier Olivo: some of the others were not fully developed. 2, W. H. Jackson, Esq., Stagden Vicarage, Bedford—a lot of medium-sized blooms, but comprising a few fine ones in Nivier Olivo, Alfred Colomb and Beauty of Waltham; 3, Mr. W. Narroway, Headington Quarry; 4th, Mr. H. Lister, gr. to Lord Brooke, Easton Lodge, Danmow. There were four entries.

Twelve, distinct, single trusses.—1st, Rev. Allen Cheales, Brockham Vicarage, Surrey—a capital boxful, the best being Marie Rady, A. K. Williams, Marie Baumann, Star of Waltham, Marchal Niel, M. Noman, and E. Lovet. 2, H. Foster, Esq., Ashford, Kent, with fresh, small-sh, generally perfect blooms—Mons. Woodfield, a very fine pink flower, and Marie Rady were conspicuous examples; 4th, Mr. Rothery, Rusbden, Windlesham, Bagshot (gr. H. Godfrey). There were six entries.

Nine, distinct, single trusses.—1st, Rev. H. B. Biron, Lymps Vicarage, Hythe: a lot of good Roses cut at the right moment, very beautiful, were—Marie Baumann, Marie van Houtte, Madame G. Luizet, Captain Christy, Violette Bowyer, Innocenta Pirola, La Boule d'Or. 2, Mr. E. Cuthill, Chapel Croft, West Hamstead, Dorking—a pretty boxful, which were preferred by some to the previous lot. 3, Rev. Canon Hodgson, Saltwood Rectory Hythe—nice blooms, but not well contrasted. 4, Mr. E. Home, Park House, Reigate. There were eight entries.

Six, distinct, single trusses.—1st, Rev. Frank S. Taylor, Littleton Vicarage, Evesham—a good stand; 2, Bidden Marchal Niel, Charles Lefebvre, and Madame G. Luizet. 2, Miss Alice Lucas, Wratton, Hitchin; 3, J. H. Ashurst, Esq., Farningham; 4th, Mr. J. Bateman, 74, Twissdale Road, Highgate. There were eight entries.

Six Teas or Noisettes, distinct, single trusses.—1st, Rev. F. R. Barnsides, Chipping Campden, Gloucestershire, with a lovely lot of flowers—Madame Cusin, M. Noman, Comtesse de Nadaillac, La Boule d'Or, Souvenir d'Elise Vardon, Etiole de Lyon, comprising the sorts; 3, Mr. Fuller, the Vicarage, Bexley; 4th, J. Sladden, Esq., Balsay, Worcester-shire. There were twelve entries.

ENTRA CLASSES.

Twenty-four, distinct, single trusses, twelve H.P., twelve Tea or Noisette.—1st, Rev. R. C. Hale, Woodmancote Rectory, Henfield, Sussex; a piece of plate went with this prize, and a very nice lot of each kind was shown, some of the finest blooms being E. Jambou, Comtesse de Nadaillac, Marie Rady, Madame G. Luizet, Beauty of Waltham, Françoise Michelon, Annie Wood, Violette Bowyer, Caroline Kuster, Madame Lambert, Souvenir d'un Ami. 2, Mr. W. H. Jackson—very good, not over-blown blooms; Alba rosea, Souvenir d'un Ami, Marie Rady, M. Noman, Dr. Andry, and A. K. Williams, comprising the choicest varieties; 3, W. J. Grant, Esq. There were nine entries.

A basket of Teas or Noisettes.—1st prize, and a piece of plate, C. E. Cuthill, Esq.—a large globular mass of fully developed and half-opened flowers; 2, E. Claxton, Esq., similar; 3, Rev. J. A. Williams, Aldermaston Lodge, Stratford. There were five entries.

Twelve, distinct, single trusses.—1st, Rev. Canon Hodgson, Saltwood Rectory, Hythe (gr. Mr. Storie). In this stand we observed nice blooms of smilax. 2, Edith Giffard, Innocenta Pirola, Duchesse de Valombrosa, Comtesse de Nadaillac; 2, W. J. Grant, Esq. There were nine entries.

Six distinct single trusses.—1st, J. H. Ashurst, Esq.; 2, Mr. Samuel Take, Hitchin; 3, L. Eames, Esq., Hitchin; 4, Rev. F. P. Lambert, Clothall Rectory, Baldock. None of these stands were of any particular merit, and although the 'pretence' had unacceptably. Ten competed.

Six new Roses, for the first time in English nurseries' lists since the spring of 1884 and subsequently single trusses.—1st, E. W. Girdlestone, Esq., Sanningdale. We did not observe anything of superlative merit, and will merely indicate the names, &c., premising that none of them had undergone a course of good culture, so small and poor were the blooms: Gloire Lyonnaise, cream-coloured; Lady of the Lake, pink, incurved petals, centre full; Madame de Watteville, creamy-white, petal cerise tipped; Souvenir de Gabrielle Drevet, similar to the previous one, but the edge colour less distinct; Grace Darling, colour of Catherine Mermet, but very small as seen; Joseph Metral, purplish-crimson.—3, Rev. Allan Cheales.

Six single trusses of any H.P.—1st, Mr. Gray, Chenevix, with Etienne Lovet; equal 1st, W. J. Grant, with Le Connet, and Mr. T. B. Hall, with Madame G. Luizet; 3, Mr. W. Narroway, with A. K. Williams; 4th, Mr. S. P. Budd, with Ulrich Brunner. Eleven competed.

Six single trusses of any Tea or Noisette.—1st, E. Claxton, Esq.—Madame H. Jamin in this stand was a very fine bloom; 2, Rev. F. K. Barnside—Innocenta Pirola was perhaps the best of its kind in the show; 3, E. W. Girdlestone. Twelve competed.

OPEN CLASSES.

Twelve Teas or Noisettes, distinct, three trusses of each.—1st, Mr. B. K. Cant, Colchester, with Madame C. Kuster, Niphotes, Madame Lambert, very good; Madame Bravy, La Boule d'Or, Marie, Madame H. Jamin. 2, Mr. F. Cant, with Madame H. Jamin, Innocenta Pirola as his best; 3, Rev. F. P. Roberts, Rectory, Scole, Norfolk; 4th, Mr. C. W. Piper. There were seven entries.

Garden Roses, of not more than twenty-four varieties.—The prizes fell in the proper sequence to the Rev. J. H. Pemberton, J. Sladden, Esq., and J. Walker. Ten competed.

Twelve bunches of any or Provence varieties.—1st, Messrs. Paul & Son, Cheshunt; 2, Messrs. G. Bunyard & Co., Cranston Nursery and Seed Co.

Twelve bunches buttonhole Roses, not less than six varieties.—There was a pretty display of these, many Roses not otherwise regarded as buttonhole Roses than in the bad state competed with others that appear just fitted for this purpose. 1st, Mr. J. Matlock; 2, Messrs. G. Bunyard & Co. New Roses, distinct, single trusses.—1st, Messrs. Paul & Son, Cheshunt; 2, Messrs. G. Bunyard & Co., Cranston Nursery and Seed Co. and President Senier; 3, Mr. B. K. Cant.

Twelve single trusses of any new Roses brought out since 1884.—1st, Mr. B. K. Cant, with Madame de Watteville; 2, Paul & Son, Cheshunt, Madame Norman Nerada.

Two single trusses of any yellow Rose.—1st, Mr. W. J. Grant, with Marie van Houtte; 2, W. H. Wakley, Esq., with Marchal Niel; 3, J. Walker, Esq.; 4th, Mr. B. K. Cant.

Twelve blooms of any white Roses.—1st, Mr. B. K. Cant, with Niphotes; 2, Messrs. Keynes, Williams & Co., with Reynolds Hole, fine blooms; 2, Messrs. Cooling & Son, Bath; 3, Mr. G. Prince, with Nivier Olivo; 4th, Mr. B. K. Cant, with small blooms of Prince Arthur.

Twelve single trusses of any Rose.—1st, Mr. H. Bennett, with very fine specimens of Lady M. Fitzwilliam; 2, Messrs. Curtis, Sandford & Co., with Ulrich Brunner; 3, Mr. B. K. Cant, with Souvenir d'Elise Vardon; 4th, Messrs. Keynes, Williams & Co.

Messrs. Bunyard & Co. exhibited, not for competition, a box of blooms of W. A. Richardson, to show its adaptability for buttonhole and bouquet uses. Mr. J. Walker, Whiston, showed a splendid assortment of English Iris in fine bloom.

Messrs. Barr & Son and Mr. T. S. Ware had a numerous collection of hardy plants in flower.

TUNBRIDGE WELLS HORTICULTURAL: July 2.

The exhibitions held here annually stand in the front rank of those that take place south of the metropolis. On the present occasion the display, with the exception of fruit, of which there was less than usual, was quite equal to that of former years. Stove and greenhouse plants were remarkably well shown; in the groups competing there was a total absence of the stale-flowered examples which, where present, have an adverse influence on the general effect.

STOVE AND GREENHOUSE FLOWERING PLANTS.

The collection of eight, with which Mr. Gibson, gr. to T. F. Durnaby Atkins, Esq., Halstead Place, Sevenoaks, took 1st, was one of the best we have seen for some time. It contained the well flowered example of *Dipladenia amblyli*, *Isora Fraseri*, a large and finely-blown *Anthurium Scherzerianum*, *Allamanda Hendersoni*, profusely flowered; and a grand specimen of the old *Clerodendron fallax*, bearing a crown of spikes of its flaming red flowers, backed by massive healthy foliage. Mr. Rann, gr. to J. Warren, Esq., Handlers' Park, Crawley, who was 2d, had, amongst other things, one of the largest and best flowered *Statice*—*S. Gilbertii*—that we have seen; it is a high coloured form of *S. Batcheri*, marine-blue; the specimen presented a dense sheet of flowers, 5 feet across; *Epacris miniata*, in beautiful condition, and a large and well-blown example of *Azalea Juliana*; 3, Mr. S. Pope, gr. to J. J. Barrow, Esq., Holmwood Park, Tunbridge Wells.

Six stove and greenhouse plants.—Here Mr. Pope took the lead; 2, Mr. Bolton, The Gardens, Coombe Bank, Sevenoaks, who staged a nicely flowered half-dozen.

Four stove and greenhouse plants.—1st, Mr. Moorhouse, gr. to J. W. Temple, Esq., Leyswood, Groombridge, who had a group of well-managed plants.

FINE FOLIAGE PLANTS.

In the class for eight, Mr. Rann had 1st honours, staging as usual a fine group of large well grown plants, the most noteworthy being *Croton Evansianus*, *C. r. acceptus*, *Phoenix tenuis*, and *Thrinax elegans*. Mr. Pope, who was 2d, also had a fine group containing *Alocasia Lowii*, *Croton angustifolius*, and *C. variegatus*, in the form of pyramids, over 7 feet high, and well clothed with highly coloured foliage.

Six fine-foilage plants.—Here again Mr. Rann took the lead with good specimens in fine order, amongst them being *Croton picturatus*, *C. Williamsii*—the latter one of the best of the large leaved kinds, a beautiful plant of *Bonaparte stricta recurva*; 2, Mr. Moorhouse, who in a good collection had *Croton Weismanni*, *Chamerops humilis*, and a splendid example of *Cycas revoluta*.

FERNS.

With eight, Mr. Pope was 1st, staging a handsome collection, the best of which were *Davallia Mooreana*, *Cyathea medullaris*, *Dicksonia squarrosa*, and *D. antarctica*; 2, Mr. Bolton.

SIX FERNS.

Here Mr. Bolton took the lead with fresh nicely grown plants; 2, Mr. Allen, gr. to G. H. Field, Esq., Ashurst Park, also having good examples.

Heavy Ferns were well shown by Mr. Scammell, gr. to C. Kelly, Esq., Tunbridge Wells, being 1st with a good group, the best of which were *Osmunda cinnamomea* and *Oocleca sensibilis*; Mr. Allen, who was 2d, likewise showed well.

LYCOPODIUMS.

As usual here these were shown in beautiful condition, 1st honours being taken by Mr. Scammell, whose collection included charming examples of *Selaginella Willdenowii*, *S. Martensii variegata*, *S. denticulata aurea*, and *S. casica*; Mr. Aylward, gr. to Mrs. Foster, Bayne House, a clove 2d, with plants only a little inferior.

PELAGONIUMS.

These were in very good condition for so late in the season. Mr. Shoelidge, gr. to W. Edwards, Esq., Fern Bank, Tunbridge Wells, and Mr. Wilkins, gr. to F. V. Williams, Esq., Shirley Hill, being 1st and 2d in the order of their names.

whilst the best six Adiantums came from Mr. Barrow, gr. to the Rev. A. Brandon, Chertsey, who had fine *Fernum cuneatum gracilimum*, and, with others, a good plant of A. Sancti Catharine, having broad sinces—a very handsome kind. Coleuses were in strong force, the best well grown and coloured pyramids coming from Mr. Waite, gr. to the Hon. Colonel Talbot, Esq. The best kinds were Princess Royal, Sunset, and Miss Kosina. Mr. J. Batt, gr. to H. W. Cuthbert, Esq., Charlton, was 23, also with good coloured pyramids. Mr. Wiggins, gr. to W. Clay, Esq., Kingston, had the best six show Pelargoniums, small, but very fresh, well-bloomed plants; as also a good showy group of seedling plants in double. Zonals were largely shown, the best blooms—really fine well-bloomed plants—coming from Mr. Waite, and included Mrs. Leavers, Madame Pomerii, Colonel Pomerii, Double Perfection, and C. H. Phayer. Mr. Waite had also the best singles, large well flowered plants, in John Gibbins, Blanche Gordon, Miss Stockham, &c.; Mr. Reeves being 20, also with good plants.

Mr. Child had the best Begonias in *Heletia*, *Boule de Neige*, *M. A. Stade*, and others, richly bloomed; and of the 2d best lot, good compact plants, came from Mr. Thorne, gr. to A. E. Flood, Esq., Walton-on-Thames.

Gloxinias were largely shown, and generally good, the best dozen really good plants, grandly flowered, coming from Mr. Bradley, gr. to Mrs. Walker, Shepperton, and Mr. Beaver the best half-dozen.

Fuchsias were in capital form, the best pyramids, in excellent bloom, coming from Mr. Reeves, and there were in the groups good specimens of *Lord Beaconsfield*, *Wave of Life*, *Mrs. Marshall*, *Gustave Doré*, and *Alba coccinea*.

The only lot of six Orchids came from Messrs. Jackson & Son, Kingston, and included some good pieces of *Dendrobium suavisimum*, *Cattleya Mossie*, *Cypripedium barbatum*, *C. grandiflorum*, &c. This firm also showed a capital group of their *Ericas*, and other stove and greenhouse plants.

The usual decorative groups were not a strong feature. Mr. Sutton, gr. to J. S. Sisson, Esq., Walton, came 1st, Mr. Reeves 2d, and Mr. Reed 3d, with combinations of the usual order.

ROSES.

These, in the form of cut flowers, were in strong force, the open forty-eight singles bringing Mr. B. K. Cant, from Colchester, with a full lot of blooms; Mr. C. Turner, of Slough, coming next. Messrs. G. Bunyard (Maidstone), and Fletcher (Atherstone), also being competitors. The flowers shown included many of the best known kinds.

Mr. Warwick, gr. to H. Kitchen, Esq., Hampton, had the best twenty-four blooms, and also the best twelve, all very fresh.

In the class for six blooms of one kind fifteen lots were staged. The old H. P. Général and Géométrique coming 1st, Lady Mary Fitzwilliam 2d—the former from Mr. Warwick, and the latter from Mr. Bennett, of Cobham.

Mr. E. Bennett, Shepperton, staged a fine box of his Lady Mary Fitzwilliam, as fine a lot as we have seen, all grand flowers. Mr. W. Taylor, Hampton, also staged good cut Roses.

FRUITS

were moderate, the best three bunches of Black Hamburgs coming from Mr. O-man, gr. to L. T. Baker, Esq., Chertsey; Mr. Waite having the second best. The former exhibits was also 1st with whites, having very good Buckland Sweetwater; and Mr. Reed followed with Foster's Seedling. Royal George was the best Peach shown, and President, a really grand sample, from Mr. Briggs, gr. to the Rev. H. Vigne, Sunbury, the best Strawberry. James Veitch and Sir Joseph Paxton were also good. William Tillery was the best Melon, and the best Cucumbers handsome samples of Blue Gown, shown by Mr. Merrick, gr. to A. Stearns, Esq., Halesford, and Tender and True from Mr. Waite, who also had the best Tomato. This exhibitor also, in good competitions, took 1st prize in two separate classes for the best lot of twelve kinds of vegetables in baskets—both very fine collections, showing high merit. In one class Mr. Batt took 2d place, and in the other Mr. Child.

Bouquets were plentiful, but chiefly amateurish, solid, and heavy.

Dinner-table decorations were more varied, and in several instances very pleasing, no less than seventeen tables being dressed with large and lesser stands in all sorts of fashions. The ladies who awarded the prizes seemed to prefer heavy dressing, the 1st prize going to a composition of cream and pink Roses with Maidenhair Ferns arranged by Miss A. Lucas, of Halesford; Miss Alice Lendy, of Sunbury, coming 2d, with a lighter combination of Dog Roses, creamy flowers in white, grasses and Ferns, but still too formal. The 3d table, dressed with simple wild flowers, scarlet Poppies, Ox-eye Daisies, yellow

Cornflowers, and blue Cornbottle, with grasses, was both elegant and pleasing, in spite of the combination of somewhat striking colours.

COTTAGERS' SHOW, LIVERPOOL:

July 3.

COMPARED with the other departments of the Royal, at Liverpool, the cottagers' display was a poor one indeed. Doubtless the earliness of the season had something to do with it, combined with the fact that in the neighbourhood of the show there are no true cottage gardens, these being situated some 6 or 7 miles distant, in Cheshire. Some nice bunches of annuals were exhibited—pretty and showy.

The class for three window plants was only represented by two exhibitors, who showed typical specimens of subjects that are, as a rule, so well done by cottage gardeners, one lot, the 1st prize, containing an exceedingly well-flowered double Ivy-leaved Pelargonium. Another subject for window culture is the double Ivy-leaved Pelargonium. The 2d prize lot had a nice plant of *Kalosanthes coccinea*, bright and good. A well flowered Begonia was also noticeable. *Fuchsias* were fairly represented in the varieties *Alvanelle* and *Mrs. Lye*.

The only class in which any approach to competition was made was that in a bunch of cut flowers, the 1st prize being awarded to a nice little posy, admirably arranged, to H. W. Mercer, Higher Bepton, Cheshire. Charming buds of *Gloire de Dijon* and other *Roses*, sweet *Carnations*, pretty blue *Forget-me-Nots* and nice sprays of *Spiceas* tastefully peeping out, made up a charming yet simple combination; the fault with most being that they were lumpy—one indeed that was disqualified, but which was awarded an extra prize, being a veritable ball of flowers. This is a matter in which our cottagers need some training—taste in arrangement, which is half the battle in a competitive display.

Vegetables call for no special comment—Potatoes, owing, doubtless, to the earliness of the season, being very small. Cabbages were pretty fairly shown. A nice collection of sweet and pot herbs was also on view. A curiosity was a bunch of five medium-sized Cucumbers (Telegraph) on a shoot or stem of some 6 or 9 inches long; originally it had produced six, one being removed. This was awarded an extra prize, and was exhibited by a shoemaker, James Norris, Liverpool Road, Fearnby.

RICHMOND SHOW: July 7.

THE SHOW was held in the customary place—the old Deer Park—three large marquees, together with a few smaller tents, being there erected to hold the exhibits. These were numerous, and generally of good quality, with the exception of some of the fruits—as *Pines* and *Grapes*—*Peaches*, *Strawberries*, and vegetables being very fine, the cottagers' exhibits especially so. *Palms* and other foliage plants, *Ferns* and the groups of plants ranged for effect in the largest marquee, the *Roses* and table decorations, the latter being encouraged by special prizes offered by the members of the Royal Family resident in the neighbourhood and by others, had brought together a considerable amount of competition.

Some very beautiful *Roses* in pots and as cut blooms were shown by Messrs. J. Veitch & Sons, which were not excelled by any at the National Rose Society's show at Kensington.

Space does not allow of a full list of awards being given, but only the names of the 1st prize-takers in the prominent classes.

Groups of plants arranged for effect, 100 square feet.—Messrs. Hooper & Co., Twickenham and Covent Garden, were here the winner of the 1st prize, the *Lilium auratum*, *Petunia Empress*, *Croton Mori*, forming some of the most attractive plants in a very pleasing arrangement.

Nine stove and greenhouse plants.—Messrs. T. Jackson & Son, Kingston, won the 1st prize with well bloomed *Fuchsias*, *Androclia*, *Pimelea*, &c., each plant being excellent in its way.

Mr. F. J. Hill, gr. to H. Little, Esq., Twickenham, took 1st prize for *Pelargoniums*.

Messrs. Jackson & Son were 1st for six exotic Orchids, having well bloomed examples, *Cattleyas* of various species, *Aerides rosea*, *Odontoglossum vexillarium roseum*, and *Saccolabium Blumel*, &c.; Messrs. F. J. Hill and Mr. H. James taking respectively 2d and 3d prizes.

Mr. Munro, gr. to E. D. Paul, Esq., Twickenham, took the prize for eight *Ferns*, well grown, handsome plants.

Mr. J. Dorset, gr. to Mrs. Welch, Westroft, Kingston, came in 1st for nice capital *Fuchsias* of medium exhibition size.

Pelargoniums of the zonal type were in great numbers, and were generally well done, the winner of the 1st prize being Mr. W. Alloway, gr. to Mrs. Flack. Messrs. Hooper & Co. took the 1st prize for a group of foliage plants (six), healthy, well grown

specimens, of a useful size, the rare *Kentia Lucyna* being one of them.

In the open Rose competition Messrs. Pau & Son, the Old Nurseries, Cheshunt, took the 1st prize for thirty-six triplets.

In the amateurs' classes for twenty-four blooms, single trusses, the prizes fell respectively to Mr. Warwick, gr. to J. P. Kitchen, Esq., Hampton; Mr. R. E. West, Highgate; and Mr. Faoning, gr. to W. Clarke, Esq., Kewhampton.

For twelve blooms, Mr. West and Mr. Warwick were 1st and 2d.

Messrs. C. Lee & Son, Hammersmith, had a capital non-competing group of "picture trees and shrubs," amongst them being the golden and silver *House Chestnuts*, *Cornus aurea elegantissima*, *Sambucus nigra aurea*, *Quercus nigra rubra*, *Q. Mirbeckii*, *Q. argentea picta*, *Cerceras elegantissima*, a very pretty silvery variegation.

FRUIT.

Mr. J. Coombes, gr. Sheen House, took 1st prize for Black Hamburgs; Mr. W. Bates, gr. to Mrs. Mack, Tolet Lodge, was 1st for Foster's Seedling; Mr. O. Hickle, gr. to W. Canad, Esq., Twickenham, took the 1st prize for a small Queen Pine; Mr. E. Lake was 1st for a dish of *Peaches* of much merit; and Mr. O. Hickle for *Nectarines*. Mr. Croker, gr. to W. Reynolds, Esq., Isleworth, was 1st for two dishes of *Strawberries*—good fruit of President and Sir J. Paxton. For a collection of six dishes of fruit Mr. H. Cakebread, gr. to Sir P. T. Rose, Bart., Kynors, Penn, Bucks, was 1st; his *Melons*, *Peaches*, *Pears* and *Grapes* being very good. A good many bunches of *Grapes* were shown, but nothing was above ordinary form, Mr. T. O-man being winner with both black and white varieties; Mr. Cakebread was 2d for white sorts.

VEGETABLES.

Cucumbers were in abundance, and were of great excellence, Mr. Fillsell, gr. to T. R. Greaves, Esq., Twickenham, taking 1st prize.

In the amateur class Mr. O. Hickle, of the Police Orphanage, Twickenham, took the 1st prize for a collection of vegetables of fairly good quality, the Cauliflowers being the weakest point. Mr. C. J. Waite, gr. to Colonel W. P. Talbot, Esq., was 1st in the open class, most of his vegetables being of good quality, especially so the *Tomatos*, *Artichokes*, *Broad Beans*, and *Peas*.

The local exhibitors came out very strongly in the vegetable classes, and the competition was consequently of a keen character.

Dinner-table decorations, bouquets, sprays, and cut flowers generally, were in great quantities, the special and other prizes being well competed for.

TWICKENHAM HORTICULTURAL:

June 28.

THROUGH the action of a neighbouring society in appropriating the date usually occupied for the summer show at Twickenham, this exhibition had to be brought forward a week, and thus to some extent in a late season suffered. Still further, shows in two adjoining parishes on the two following days presented obstacles to many exhibitors. As a result the classes were generally thinly filled, and the show as a whole was not up to its usual mark. In one respect, however, some compensation was made, as the grand groups of cut flowers from Mr. Walker, of Whetton and Mr. W. Poupard, of Twickenham, demonstrated. Mr. Walker puts up always the finest *Deffidolis*, and in the same way his *Pæonies*. *Irises*, both English and Spanish in great and beautiful variety, and rich orange and yellow examples of *Papaver nudicaule*, were fresh and exceedingly beautiful. Mr. Poupard showed *Pæonies* and *Irises*, also mosses and other *Roses*, crimson and various coloured *Carnations*, Sweet Peas, in several striking colours, &c. Of general plant groups there were sent by Messrs. Veitch & Sons, Chelsea, a lovely lot of dwarf *Roses* in pots, wonderfully fresh and striking, neatly margined with the telling variegated *Eurya latifolia*. From Messrs. Jackson & Son, Kingston, came a charming group of stove and greenhouse plants, including good *Ericas*, *Ixoras*, *Pimeleas*, and numerous good *Orchids*. Mr. W. Gordon, of Twickenham, sent a capital lot of plants that included many good forms of *Odontoglossum Alexandrie*, also *Tuberoses*, and *Lalums*. Mr. R. Lving, Twickenham, had a pretty group of decorative plants, with, standing out from them, some wondrously flowered *Tuberoses*. Mr. Wiggins, gr. to W. Clay, Esq., Kingston, sent a very effective group of seedling large-flowered and golden tricolor *Pelargoniums*, which were greatly admired. Mr. Henry Little, Twickenham, showed a fine lot of *Orchids*, including many fine *Cattleyas*; and from Mr. W. Taylor, Hampton, came baskets of Captain Christy and Lady Mary Fitzwilliam *Roses*, with a good lot of other blooms, including the pretty single-flowered *rugosa*. Mr. Bray, of Richmond, had two handsome bouquets of *Roses*, one white the

other pink and crimson, with ribbon trimmings to match.

Decorative Groups.—In the open class the finest of these was sent up by Messrs. Hooper & Co., in that firm's superb style. *Petunia Empress*, a lovely soft tint, and grand *Gloxinias*, were prominent features in a faultless arrangement. Mr. Fittell, gr. to Mr. Greaves, next followed, with a neat arrangement. In the smaller groups the best, a very bright coloured affair, neatly arranged, came from Mr. Buckland, gr. to G. J. Atkins, Esq., Twickenham; Mr. Bates, gr. to Mrs. Meek, Poulett Lodge, Twickenham, in whose charming grounds the show was held, took 1st place with six plants in flower, having really capital examples of *Allamanda Hendersoni*, *Clerodendron Balfourianum*, *Bougainvillea glabra*, *Pimplago cespensis*, *Sobralia macrantha*, and the pretty white *Trachelospermum*. Messrs. Jackson & Son were 2d, having good *Franciscia calycina* major, *Boronia elatior*, and *Darwinia fuchsoides*, &c. The only lot of large-flowered Pelargoniums came from Mr. Hill, gr. to H. Little, Esq., fine plants of *Delicatum* and *Nelly Fordham* (fancied), and *Thebais formosa*, &c., large flowered.

Gloxinias were good, especially the six plants from Mr. C. Garrod, gr. to J. R. Tidale, Esq., dwarf, finely flowered, and admirably grown; Mr. Parsons, gr. to T. Twining, Esq., had the 2d best lot, really good plants also, and the only lot of *Begonias* in bloom, small but admirably flowered.

Fruit was moderately represented, the best Black Grapes, really good *Madesfield Court*, superbly finished, coming from Mr. Thomson, gr. to Messrs. Wells, of Hounslow; Mr. Parsons coming next with good Hamburgs; the best whites were good *Foster's Seedling*, from Mr. O. Hickie, gr. to W. Canard, Esq., Orleans House; and Mr. Thompson was 2d best with promising Muscats. Mr. Thompson had the best dish of Peaches in fine Gros Mignonne; Mr. Hickie the best Nectarines in fine Elrage; and Mr. Waite, gr. to the Hon. C. Talbot, Esher, the best Melon, in *Hero of Lockinge*. He was also 1st with a handsome brace of Tender and True Cucumbers, *Royal Windsor* coming 2d. The finest Tomatos, *Ne plus Ultra*, came from Mr. Hickie. Mr. Waite was an easy 1st with a fine lot of vegetables, inclusive of Snowdrop Potatoes, Leviathan Beans, Early Nantes Carrots, Telephone Peas, good Cauliflowers, &c. Mr. Poupart sent a very fine lot of market vegetables, including Giant Cauliflowers, fine Cabbages, Turnips, Tomatos, Vegetable Marrows, &c. The cut flower and table decoration tent was well filled, but Roses were of moderate quality. As usual, the best box of cut *Gloxinias*, really beautiful blooms, came from Mr. Norwich, gr. to J. P. Kitching, Esq., Hampton.

COLONIAL NOTES.

A HANDFUL OF NATAL TERRESTRIAL ORCHIDS.

It is well known that although South Africa does not abound in showy epiphytal Orchids, yet there are very many handsome terrestrial species in this country well worth cultivation. On looking through trade lists or scanning the pages of the *Gardener's Chronicle*, it is rare to find aught from South Africa but *Disa grandiflora* or *D. Herschellii*. I shall venture to describe here a few of the best terrestrial species I know, omitting very many others which I have met with, as not being showy they do not seem to be worth much notice for garden purposes. I must say that it is very difficult to identify with precision any Orchid here except the best known ones. I have not seen the below-quoted plates from the *Botanical Magazine*, &c.; all know how badly Orchids dry (for the herbarium), and there is no complete set of native plants properly named in town here, but I will do the best I can. Following Harvey's *Genera* we begin with—

Eulophia ensata, Lindley, *Bot. Rec.*, t. 1147.—Pseudobulbs shaped like a flattened Potato, six to eight in number, lying well below the soil. Leaves long and narrow, about 1 inch broad, and 18 inches long. Flower-stem 1½—2 feet long, bearing at the top a dense cluster of from thirty to forty tube-shaped flowers, three-quarters of an inch long, of a clear bright yellow. Sepals, petals, and labellum, all much alike; the lip has a short spur, and is covered with short hair-like teeth. This is a tall, noticeable plant, flowering through December and the first week of January. It grows amongst long grass fully exposed to the sun, at elevations of 2500—3000 feet on hillsides, and also on level ground. Soil a heavy black loam.

Eulophia Dreyana, Lindley. — Pseudobulbs flat-

tened, conical in shape, their tops just visible above the soil. Leaves recurved, rather more than 1 inch broad and 1 foot long. Flower-stem 1½ foot long, bearing about a dozen flowers, near 2 inches across, in a lax raceme. Sepals green, pale pale primrose-yellow or white. Lip superior, mauve-coloured, with a small spur. A very bright, handsome plant, flowering about the same time as the last species. Rather rare; grows in peaty soil amongst rocks in moistish but open places, at an elevation of 3000—3500 feet.

E. sp.—A very fine species I once saw, but neglected to collect, may be briefly noted. Habit of *E. ensata*, but the flowers are twice as large, yellow, with a deep maroon spot at the base of the lip.

Lisiosichilus Kriebii, Reichenbach fil., *Bot. Mag.*, t. 5361.—Pseudobulbs conical, growing on the surface of the soil. Leaves nearly 2 inches across, and 1½ foot long. Flower-stem 4 to 6 feet high, bearing about fifty flowers, which are 1½ to 2 inches across. Sepals light brown or deep maroon-purple. Petals golden-yellow above, cream-coloured beneath. Lip with a short spur, yellow and purple-tinted. The finest Orchid I know of, and well worth a place in the most select collection. One variety I have seen has the petals veined with purple beneath, and is probably the same variety as that described by Mr. H. N. Ridley as *L. Kriebii* var. *purpurata* (see *Gard. Chron.*, July 25, 1885, p. 102). Time of flowering from beginning of November to end of January. Our plant is by no means plentiful, it is never found growing in the open sun, but on the outskirts of the bush in partial shade at an elevation of 3000 feet. Soil, loose peat and leaf-mould.

Satyrion cantileum, Lindley.—Tubers ovate, about 2 inches long. Flower-stem 12—15 inches high, with two large ovate leaves at the base. Flowers from fifteen to twenty, about half an inch across, snow-white, sweet-scented. The back sepal has two long slender spurs. The shape of the flower reminds one of a Gothic gargyle. It is a pretty species, one of our earliest spring flowers. It is found growing on open hillsides in black loamy soil amongst grass, flowering through November, at an elevation of 2500—3000 feet.

S. canum, R. Brown, *Bot. Mac.*, t. 1512.—This plant is like the foregoing in habit and locality, but it flowers about a month later, and is more robust in habit. The flowers are rosy-carmine, and I have seen wild specimens 3 feet high; but I must say I am not certain of the exact names of these two *Satyrions*, owing to reasons as above stated.

Disa polygonolus, Lindley, *Bot. Mag.*, t. 6532.—Tuber long and pointed, about 4 inches long. Leaves lanceolate. Flower-stem 2—4 feet high, bearing 100—200 small close-set flowers, varying in colour from pink to scarlet. A showy species, growing often on steep hill-sides in heavy red clay or black loam fully exposed to the sun. It continues in flower during December and January at an elevation of from 2500—3000 feet.

D. macrantha, or what is taken for such, I have spoken of in a previous paper as found near the Poela.

Disperis Fanninii, Haavey, *Thesaurus*, t. 171.—A very delicate quaint little plant. Tubers very small. Flower-stem a foot high, leaves stem-clasping. Flower-stem 3—5 in number, nearly three-quarters of an inch across; with a purple tint. The structure of the flower is very curious, in aspect it resembles an old-fashioned mob-cap! It grows under the shade of trees, amongst leaf-mould, at an elevation of 3000 feet.

CULTIVATION.

In addition to the above Orchids I would mention a *Cymbidium*, possibly a terrestrial species. I have one plant, but it has not yet flowered. It has long cylindrical pseudobulbs (evidently tending to a true stem) some 2 feet long, crowned by a tuft of two-dome-like leaves 1 foot long and 1 inch broad. Can this be Harvey's *Cymbidium Sandersoni* first described by him some thirty-five years ago, but since lost sight of?

And now a word as to cultivation, of which I should not have ventured to add to Mr. Brown's remarks, were it not that he refers mostly to the Cape climate which is very nearly the reverse of ours. My knowledge of the Cape peninsula is very limited. Twelve years ago I spent two days there, and partly ascended Table Mountain. In that region, as I understand, most rain falls between May and September in the winter. The dry season is in summer, from November to April.

In Natal it is just the other way about. Our Orchid flower in the moist season from November to March, during which time they enjoy much rain and sun alternately. From April to October rain is scarce—a slight shower every month on the average; but—and I wish to draw special attention to this—the soil beneath the surface does not get dust-dry. Nearly all our Orchids, save *Lisiosichili*, delight in a heavy retentive black loam or red clay, interlaced with grass roots; during winter the air is very clear and the dews are heavy and of course the dry grass absorbs a good deal of moisture. There is no deep secret in the cultivation of terrestrial Orchids; we see *Disas* and *Satyrions* growing alongside of *Gладиoli* and *Zazantias*, and surely any one can grow the last named.

Lisiosichili and *Eulophias*, from the nature of their rhizomes, have an indefinite life, but the members of the great tribe *Ophrydeæ* seem to live but a few years. Take *Disa polygonolus*, for instance. The first year's seedling will be a tiny plant about 2 inches high, the second year it increases in strength, the third it flowers, the fourth a stronger spike is sent up, and then the plant perishes. *Disas* and *Satyrions*, however, send very freely, and there should be no difficulty in thus propagating them. I would advise firm potting in turfy loam with good drainage, and to meddle with them as little as possible. Keep the plants cool and moderately dry in the winter, and heat with moisture in the summer.

I cannot refrain (though it has no direct bearing on Orchids) from speaking of the most unusual weather we have had in the past summer. March generally sees the last of the summer rains, and the final shower is usually a heavy one, but this season has been overpassed for very many years. On the afternoon and evening of March 7 there fell 4.20 inches of rain. A sudden flood of course followed. Our river rose 30 feet in less than six hours, and much damage was done. I regret to say the *Tuberose* crop has suffered much. Very many thousands of bulbs planted near the river were torn out of the ground, swept away, and totally lost; those remaining were further injured by a heavy hailstorm two days after. R. W. Adlam, *Maritzburg, Natal*.

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, JULY 7, 1886.

MONTH AND DAY.	BAROMETER.		TEMPERATURE OF THE AIR.				Hygrometric Reductions Glaisher's Tables 7th Edition.	WIND.	RAINFALL.

- July 1.—Very fine day.
- 2.—Very fine.
- 3.—Very fine, few light clouds in afternoon.
- 4.—Fine day.
- 5.—Very fine.
- 6.—Very fine.
- 7.—Very fine, few clouds in morning.

LONDON: Atmospheric Pressure.—During the week ending July 3, the reading of the barometer at the level of the sea increased from 30.02 inches at the beginning of the week, to 30.24 inches by 9 A.M. on the 28th, decreased to 30.10 inches by 5 P.M. on the same day, increased to 30.33 inches by 9 A.M. and decreased to 30.27 inches by 5 P.M. on July 1st, increased to 30.34 inches by 9 A.M. on the 2nd, and was 30.30 inches by the end of the week. The mean reading of the barometer for the week

at the level of the sea was 30.26 inches, being 0.27 inch higher than last week, 0.26 inch above the average of the week.

Temperature.—The highest temperature in the shade in the week was 83°.0 on July 3rd; on the 1st the highest temperature was 70°.5. The mean of the seven high day temperatures was 76°.0.

The lowest temperature was 48°.5, on July 1st; on June 30th, the lowest temperature was 54°.0. The mean of the seven low night temperatures was 52°.1.

The greatest range of temperature in one day was 29°.3, on June 29th; on the 27th the smallest, was 18°.3. The mean of the seven daily ranges was 23°.9.

The mean temperatures were, on the 27th, 63°.2; on the 28th, 63°.7; on the 29th, 65°.5; on the 30th, 62°.6; on July 1st, 59°.2; on the 2nd, 63°.9; and on the 3rd, 66°.9; and these were all above their averages (excepting July 1st which was 2° below) by 1°.2, 4°.2, 2°.4, 1°.4, 2°.3 and 5°.7, respectively.

The mean temperature of the week was 63°.4, being 5°.4 higher than last week, and 2°.1 above the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun, was 135°.5, on the 28th. The mean of the seven readings was 129°.9.

Rain.—No rain fell during the week.

ENGLAND: Temperature.—During the week ending July 3, the highest temperatures were 88°.2 at Cambridge, 85°.0 at Truro, 84°.0 at Sheffield and Leeds; the highest at Liverpool was 73°.5, at Brighton 74°.5, at Plymouth, 76°.2. The general mean was 80°.4.

The lowest temperatures were 35° at Sheffield, 41°.3 at Cambridge, 44° at Hull; the lowest at Liverpool was 51°.4, at Plymouth 49°.9, at Brighton 49°.3. The general mean was 46°.2.

The greatest ranges were 49° at Sheffield, 46°.9 at Cambridge, 40° at Truro; the least ranges were 22°.1 at Liverpool, 25°.2 at Brighton, 26°.3 at Plymouth. The general mean was 34°.2.

The mean of the seven high day temperatures was highest at Cambridge 78°.8, at Truro 77°.7, at Bristol 76°.1; and was lowest at Liverpool 70°.4, at Bradford 70°.6, at Brighton 71°.2. The general mean was 74°.0.

The mean of the seven low night temperatures was highest at Liverpool 55°.8, at Wolverhampton 54°.7, at Preston 54°.4; and was lowest at Cambridge 47°.4, at Truro 48°.3; at Hull 49°.1. The general mean was 51°.5.

The mean daily range was greatest at Sheffield 32°.1, at Cambridge 31°.4, at Truro, 29°.4; and was least at Liverpool 14°.6, at Bradford 18°. at Preston 18°.9. The general mean was 22°.5.

The mean temperature was highest at Blackheath 63°.4, at Wolverhampton 62°.6, at Leeds 62°.4; and was lowest at Sheffield, 57°.2, at Hull 58°.8, at Bradford 59°.8. The general mean was 60°.9.

Rain.—There was no rainfall at any station during the week, excepting at Nottingham, when the amount of two days was 0.16 inch.

SCOTLAND: Temperature.—During the week ending July 3, the highest temperature was 81°.7, at Dundee, at Greenock the highest was 77°.2. The general mean was 79°.4.

The lowest temperature in the week was 37°.5, at Perth; at Dundee the lowest temperature was 45°.6. The general mean was 41°.8.

The mean temperature was highest at Dundee 61°.3, and lowest at Aberdeen 58°. The general mean was 60°.0.

Rain.—Rain fell at Aberdeen to the amount of 0.16 inch. No rain fell at Glasgow, Edinburgh, Dundee, Greenock, Leith, Paisley, or Perth.

JAMES GLAISHER, F.R.S.

SUMMARY OF TEMPERATURE, RAINFALL, AND DURATION OF BRIGHT SUNSHINE in the United Kingdom, for agricultural and sanitary purposes, for the week ending Monday, July 5, 1886, issued by the Meteorological Office, 116, Victoria Street, London, S.W.1.—The weather has been cloudy and somewhat showery in the extreme north of Scotland, but fine in all other parts of the kingdom.

The temperature has been above the mean in all districts, the excess varying from 1° in "Scotland, N.," and "England, E.," and 2° in "England, N.W.," to 4° in "England, N.E.," and "England,

S.W.," and 5° in the "Midland Counties," and "Ireland, S." The highest of the maxima, which were generally registered on the 3d or 4th in England and on earlier dates in Ireland and Scotland, were as high as from 85° to 89° over the greater part of England, between 81° and 84° in Ireland, and 69° and 81° in Scotland. The lowest of the minima, which were registered during the earlier part of the week, ranged from 42° in "England, E.," to 49° in "England, N.E.," and to 53° in the "Channel Islands."

The rainfall has been slightly more than the mean in "Scotland, N.," but in all other districts rain has been almost entirely absent.

Bright sunshine shows a decrease in the extreme north and east of Scotland, but a very considerable increase elsewhere. The percentages of the possible amount of duration over England and the "Channel Islands" were very high, ranging from 55 in "England, N.E.," and 61 in "England, N.W.," to 77 in "England, S.," 83 in "England, S.W.," and 89 in the "Channel Islands." The highest percentages at individual stations were 89 at Jersey, 88 at Hastings, 86 at Falmouth, and 85 at Pembroke. These figures are higher than any which have been recorded since the commencement of the "Bright Sunshine" returns in April, 1880. The highest percentages previously recorded were 83 at York, and 85 at Gledeston, for the week ending May 22, 1882.

Depressions observed.—During the whole of this period the distribution of barometric pressure over our islands was anticyclonic, and the only depressions which appeared in our area were some large but shallow disturbances which passed in an easterly direction outside our northern coasts. The winds over the United Kingdom were consequently light and variable, but at our northern stations westerly or south-westerly breezes generally prevailed, and in the south, light easterly or north-easterly airs.

Answers to Correspondents.

LEAF-CUTTER SAWFLY: L. M. The holes in your Rose-leaf are made by the larva of the Rose Sawfly

FIG. 13.—LEAF-CUTTER SAWFLY.

(fig. 13), which builds its nest of the fragments, and retires into retreat into the case so formed, till it alters its form, and changes its mind, and issues as a perfect insect.

DOUBLE LILY: J. S. W. Many thanks. Please mark the plant and report on its behaviour next year. The specimen was not in fit condition for determination when we saw it.

ERRATA: Liverpool Show Report.—Class 76, instead of "R. B. Laird & Sons, 1st and Cocker & Sons, Aberdeen, 2d," read "1st, Messrs. Cocker & Sons, Aberdeen; and 2d, Messrs. R. B. Laird, Edinburgh." Implement class: hand-nowing machine.—The Silver Medal, given to Messrs. Chadborn & Coldwell for their exhibit, was of equal value to that given to Messrs. Barford & Perkins, these latter gentlemen objecting to the use of the definite article: Messrs. J. Carter & Co., 237 and 239, High Holborn, London, showed a collection of hardy annuals raised from seed, and were awarded a Silver Banksian Medal.

FLORA OF ALGERIES: Miss O. Munby's Catalogue, published by Taylor & Francis.

FLORA OF FRANCE: Miss H. Gillet et Magne, Flore de France.

FOXGLOVE: Miss S. Your plant is distorted by fasciation, caused probably in this case by some injury in a very early stage of growth.

NAMES OF LARGEST ENGLISH GROWERS OF TOMATOS, CUCUMBERS, AND MUSHROOMS FOR MARKET: H. T. We do not know who are the largest growers.

NAMES OF PLANTS: H. R. Grape, white, Mrs. Pearson; Jasminum Sambac fl.-pl.—Collins & Co. Campanula

pumila.—P. J. I. 1, Lolium perenne; 2, Festuca pratensis; 3, Arrhenatherum avenaceum with smut (Puccinia); 4, Festuca pratensis var. elatior; 5, Festuca ovina; 6, Bromus erectus—H. S. Guernsey, 1, Galium mollugo; 2, Hieracium sphondylium; 3, Senecio Jacobaea; 4, Chrysanthemum Leucanthemum; 5, Scrophularia nodosa; 6, Fumaria capreolata; 7, Lychnis dioica; 8, Achillea Millefolium; 9, Silene acaulis; 10, Lotus corniculatus; 11, Cytisoidium unguiculatum; 12, Cactulus Andrieuxii; 13, Vicia sativa. Another time send six specimens only.—W. C. B. 1, Ecremocarpos scaber; 2, Geranium platypterum; 3, Jasminum revolutum; 4, Santolina incana.—F. C. 1, Lepidium sativum; 2, Leontodon autumnalis; 3, Medicago lupulina; 4, Dentia scabra; 5, Leontodon hirtus; 6, Crepis biennis.—E. C. C. D. Fuchsia procumbens.—T. K. Ingram, 1, Dolichocheila tubiflora; 2, Peperomia tetradiflora; 3, Scilla peruviana; 4, Francoa ramosa; 5, Rivina lewisii; 6, not in a fit state to name.—H. P. Eleagnus longipes. The fruit of some varieties of this are said to be of good flavour, but your fruit is too rough-tasted to be eaten raw; it may perhaps name gauding jam or tarts.—W. S. Barkeria elegans.

PETUNIAS: J. C. & Co. Your complaint should be addressed to your German correspondents, and if they decline to furnish a satisfactory explanation then we might publish your protest.

RED SYCAMORE: A. Y. Z. The red-fruited form of the common Sycamore, Acer pseudo-Platanus variety erythrocarpa.

THE BEST COLONIES FOR A FLORIST AND GARDENER: Content Subscriber. Those that have been the longest settled, and where wealth abounds, viz., the large towns and cities of Canada and Australia. In the latter you would have to compete with the frugal and laborious Chinaman; and in the former with a winter of six months' duration. Flower growing would pay better than vegetable culture. Assisted passages are not given to gardeners. Visit the Colonial Exhibition, read the Catalogues, and decide for yourself.

WILSON JUNIOR BLACKBERRY: F. C. & Co. The best plan will be to exhibit specimens before the Fruit Committee at its next meeting.

WIREWORM AND CRESYLLINE.—H. W. Birt will forward his address to us, we could publish his letter on the above subject.

Obituary.

MR. WILLIAM SERJESSION.—This gentleman died at Trafford Park, Manchester, on June 25, in his eighty-second year. He had held the position of Head Gardener to Sir Humphrey and Lady de Trafford since 1849. Though an invalid for eight years, he was, through the kindness of Lady de Trafford, allowed to retain his position up to the time of his death. He was buried at St. Ann's Church, Baxton-or-Irwell.

Markets.

COVENT GARDEN, July 8. MARKETS VERY heavy, with business dull, James Webber, Wholesale Apple Market.

19.—Garden Tools of every description.
20.—Quotations for every requisite.

THE TRADE SUPPLIED

ADJUSTABLE ELECTRIC THERMOMETERS

For GREENHOUSES, VINERIES, CONSERVATORIES, FORCING PITTS, INCUBATORIES, and for FIRE.

TESTIMONIALS.

"Your Thermometers are now in all the Sheds, and to you are we indebted for uniformly strong and healthy Plants."

"Last night your Electric Tell-tale saved what is probably the finest house of Pines in the Kingdom."

"Your Electric Thermometer is a mighty good thing, and no Wine Grewer should be without them. Timely notice of approaching frost means the saving of perhaps a whole crop."

THE ADJUSTABLE ELECTRIC THERMOMETER

Is so applied, that when the temperature either rises above or falls below the degree at which it may be set, a bell is sounded or other signal given at however great a distance.

FRANCIS AND CO.'S Thermometers are largely employed by Wine Growers in the open as well as under Glass, and are most valuable for Conservatories, Greenhouses, Forcing Pits, Hospital Wards, and in the process of Incubation.

Used throughout the Ostrich Farms of South Africa.

ADJUSTABLE ELECTRIC THERMOMETERS

Also form the most perfect PROTECTION AGAINST FIRE, the ever ready Alarm signalling the very first outbreak instantly.

Readily applied Fitted with ease and certainty.

PRICES.

FRANCIS & CO., Telegraph Engineers and Government Contractors.

EAGLE TELEGRAPH WORKS, HATTON GARDEN LONDON, E.C. SEND for CATALOGUE.

Oil Paint no Longer Necessary. HILL and SMITH'S BLACK VARNISH, for Preserving Ironwork, Wood, or Stone.

This VARNISH is an excellent substitute for oil paint or any outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of forty years ago by the Advertiser, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale.

Sold in Casks of about 30 gallons each, at 11. 6d. per gallon, at the Manufactory; or 11. 8d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL.

From ALBERT WARE, Esq., The Rymer, Atterley Lodge. "Some twenty years ago I used your Black Varnish, and shall be glad if you will forward me a cask, as I consider it the best thing known for the preservation of all outdoor work, either wood or iron, that requires to be painted."

CAUTION.—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.

Every cask is legibly marked with their name and Registered Trade Mark as above, without which one is genuine. Large Illustrated CATALOGUE on Fencing, Hurdles, Field and Entrance Gates, &c., sent free on application to

HILL & SMITH, Briery Hill Ironworks, near Dudley; 118, Queen Victoria Street, London, E.C.; and 116, Stephen's Green, Dublin.

THE TROPICAL AGRICULTURIST,

A MONTHLY RECORD OF INFORMATION FOR PLANTERS

Of Tea, Cocoa, Cinchona, Coffee, Indiarubbers, Sugar, Palms, Cotton, Cereals, &c. Native and Exotic Plants, Fertilizers, Fibrous Plants, and other Products suited for Cultivation in the Tropics.

Published at Observer's Office, Colombo, Ceylon, on or about the 1st of each Month. Commenced in June, 1881.

THE "TROPICAL AGRICULTURIST" has now an assured position in its large circulation in Ceylon, Southern India, and Central and Northern India, the Straits Settlements, Sumatra, Java, Borneo, Northern Australia, Queensland, Central America, Natal, Mauritius, and the West Indies. From all sub-tropical planting settlements we have had a liberal approval of the publication and an encouraging measure of support. The English, Indian, and Colonial Press have spoken in commendatory terms of the T. A., as also Directors of Public Gardens from Sir Joseph Hooker, F.R.S., downwards, and so have all Planters.

Not a Planter should be without it.

Rates of Subscription, including Postage, in Advance: £1 sterling, Rupees 12; Dollars 5.

Single Copies, 2s., or Rr.; Back Copies, 3s., or Rr. 5s. Any one of the Four Volumes completed (1881-2, 1882-3, 1883-4, 1884-5), bound in cloth, lettered, with Comprehensiveness, for 10s. 6d., carriage prepaid.

THE TROPICAL AGRICULTURIST.

As a medium for English, American, and Australian ADVERTISEMENTS of goods suitable for the tropics, India as well as Ceylon, the Straits Settlements, Java, and West Indies (Central America being included in that term), or connected with agriculture, the Tropical Agriculturist stands unrivalled, the work being constantly in the hands of Native as well as European and American Agriculturists. Being a Monthly Periodical the Tropical Agriculturist lies on the table and is very often referred to during each month, a fact which Advertisers will know how to appreciate.

Mr. W. T. FUSSELL, F.R.S., C.M.G., Director of Kew Gardens, writing of the T. A., refers to it as "an astonishing repository of everything relating to the Economic Botany of the Tropics."

For the Sale of Plants, Seeds, Machinery, Implements, &c., used in Tropical (Tea, Sugar, Fibres, &c.) Agriculture, no better Advertising Medium exists.

Rates for Advertisements:—

WANTED, a HEAD PACKER, must be thoroughly experienced and energetic.—Apply, in own handwriting, to JAMES DICKSON and SONS, "Newton" Nurseries, London, N.

WANT PLACES.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be filled in payable at No. 42, DRURY LANE, to W. RICHARDS, as, unless the Number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE ORDER.

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.

Advertisers are requested when Remitting to give their Names and Address, and also a Reference to the Advertisement which they wish Repeated.

B. S. WILLIAMS begs to intimate that he has at present in the Nursery and upon his Register several excellent Manure-composers for the situation of HEAD GARDENER, BAILIFF, FOREMAN, or JOURNEYMAN. Ladies and Gentlemen requiring any of the above will please send full particulars, when the best selections for the different capacities will be made.—Widlow, N.

GARDENERS, FARM BAILIFFS, and FOREMEN.—We are always in possession of competent MEN of the highest respectability, and thoroughly practical at their business, readily furnishing full particulars on application.—JAMES DICKSON and SONS, "Newton" Nurseries.

RICHARD SMITH and CO. beg to intimate that they are constantly receiving applications from Gardeners, seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

TO LANDED PROPRIETORS, &c.—A. MCINTYRE (late of Victoria Park) is now at liberty to undertake Formation and Planting of New Gardens and Parks Grounds, and Remodelling existing Gardens. Plans prepared. 115, Listeria Park, Stamford Hill, N.

GARDENER (HEAD).—Desires re-engagement. Thoroughly acquainted with all branches. First-rate references as to character and ability.—R. WALTON, Hilton Park, near Wolverhampton.

GARDENER (HEAD).—Married, no encumbrance; twenty years as Head Gardener. Thoroughly experienced. First-rate references and character.—H. S. Mrs. COON, Burnt Ash Hill, Lee, S.E.

GARDENER (HEAD).—Age 32, married; has had eighteen years' practical experience in all branches of the profession. Character will bear strictest investigation. Abstainer.—J. THOMAS, Stehnam, M'dhurst.

GARDENER (HEAD); age 32.—Lord WANTAGE, Lockinge Park, Wantage, is desirous of recommending H. Brown to any Lady or Gentleman requiring a good all-round Gardener as above.

GARDENER (HEAD), near London preferred.—Thoroughly practical in all branches. Excellent character from Noblemen and Gentlemen. Good references as to ability.—GARDENER, 5, Rutland Street, Montpelier Square, Knightsbridge, S.W.

GARDENER (HEAD), age 31, without family.—Mr. DERRICOTT, Gardener to Lady Edwards, Pve Nest, Malrose, can recommend a young Man, well up in Plant, Fruit, and Vegetable Culture, and general routine of Gardening, to any Lady or Gentleman requiring one.

GARDENER (HEAD), in a good establishment.—A CLERGYMAN thoroughly recommends a parishioner as above. Thoroughly practical in all branches of the profession. Excellent character from past and present employers.—RECTOR, Chale, Isle of Wight.

GARDENER (HEAD); age 29, married when suited.—R. HUBBARD, The Gardens, Rushton Hall, Kettering, Northamptonshire, is at liberty to engage with any Lady or Gentleman requiring a thoroughly practical Man. Fifteen years' experience in good establishments. Excellent references from past and present employers.

GARDENER (HEAD), where a man of ability and strict integrity is required, and the keeping of every detail and tidy.—Age 35, married, two children; total abstinence. Has had twenty years' practical experience in the Cultivation of Grapes, Peaches, Cucumbers, Melons, Tomatoes, Strawberries, Mushrooms, Stove and Greenhouse Plants, Ferns, Roses, and Flowering Shrubs. Grounds and Planting in Kitchen Gardens; is a good Plantman, and Fruit and Vegetable Grower. Excellent character.—W. Gardener's Chronicle Office, 41, Wellington Street, Strand, W.C.

GARDENER (HEAD WORKING).—Age 27; fourteen years' experience, and has a thorough practical knowledge of all matters relating to Horticulture. Well recommended.—JNO. JENKS, Oaken, near Wolverhampton.

GARDENER (HEAD WORKING).—Age 49, married (one daughter, age 14); upwards of twenty years' practical experience. Highest references as to character and ability.—E. DURANTS, E. Finch Highway, N.

GARDENER (HEAD WORKING); age 28.—H. GILBERT, late Foreman to the Hon. Lord Dugby, is open to engage with any Lady or Gentleman in want of a practical man as above. Highly recommended.—Gardens, Southwick Park, Farnham, Hants.

GARDENER (HEAD WORKING).—Seventeen years' experience. Vines, Peaches, Melons, Cucumbers, Stove and Greenhouse Plants, and Ferns. Five years' good character from last place.—S. WILSON, Lexden Park, Colchester, Essex.

GARDENER (HEAD WORKING), age 28, married when suited.—22 years for assistance to obtain situation as above; experienced in all branches. Well recommended. Churchman, many years Chorister.—JOHN TAYLOR, 80, Cleveland Road, Surbiton, Surrey.

GARDENER (HEAD WORKING); age 27, married, no family.—A Gentleman can highly recommend his late Foreman in all branches and the routine of a Gentleman's Establishment.—H. D., The Grove Gardens, Elphinstone Road, Hastings.

GARDENER (HEAD WORKING), where one or more are kept, or SECOND, in a good establishment.—Age 25, single; nine years' experience of Stove and Greenhouse Plants, and Kitchen Gardening. Highly recommended.—J. G., Paddeck Wood, Kent.

GARDENER.—Unmarried, competent in Vines, Peaches, Melons, Cucumbers, Stove and Greenhouse Plants, and through Cropping of Kitchen Gardens.—JOHN BREEN, Bromborough, Wirkenhead, Cheshire.

GARDENER.—A GENTLEMAN wishes to be recommended his late Under-Gardener, who has only left him through ill health. More than ten years' good character.—E. W. CRACROFT, Esq., Hackthorn Hall, Lincoln.

GARDENER (SINGLE-HANDED).—Fourteen years' experience Inside and Out; good references.—GARDNER, 2, Birch Terrace, Orsett, Essex.

GARDENER (SINGLE-HANDED).—Young, single; nine years' experience in Glass, Flowers, especially in the Herbaceous and Kitchen Gardens. Satisfactory reasons for leaving. Good character and recommendations.—J. KEMP, Great Warley, Brentwood, Essex.

GARDENER (UNDER); age 20.—G. BATES can be recommended by his present employer, Horace Mellor, Esq., Broomfield, Luton, Bedfordshire.

GARDENER (UNDER), or FIRST JOURNEYMAN, Inside or Out; age 21; seven years' experience. Good reference.—W. P., 6, Lion Terrace, Beamish Road, Putney, S.W.

MANAGER.—Wanted, by the late Manager, The Royal Vicaries, Jersey, a re-appointment. Well up in Grapes, Peaches, Cucumbers, Tomatoes, Ferns, Roses, and Flowering Shrubs. High class work. More than ten years' Pay own expenses.—M. THUN, Springfield Nurseries, Jersey.

FOREMAN, where two or three are kept, in the Houses.—Age 24; can be well recommended as to ability, &c.—A. W., 23, Salisbury Road, Highgate, London, N.

FOREMAN, in a Private Establishment.—Well experienced in all branches. Two years' good character from last place, Mr. Bromley.—G. EMERY, 7, Elgin Terrace, Madia Vale, London, W.

To Nurserymen.

FOREMAN, Outdoor.—Age 36; twenty years' experience in Roses, Conifers, Fruit, Forest, and other Stock, Management of Men, &c. Eight years in last place.—HORTUS, Gardener's Chronicle Office, 41, Wellington Street, Strand, W.C.

FOREMAN; age 28.—LUCOMBE, PINCE & Co., Easter Nurseries, Devonshire, would be pleased to hear of a Foreman's place for one of good recommendation; abstainer. Ten and a half years' experience, Inside and Out, in Noblemen's and Gentlemen's Gardens; knowledge of House Decorations. Please state wages, Distance no object.

To Head Gardeners

FOREMAN, in the Houses, or otherwise, in a good establishment.—Age 28; ten years' practical experience, two years as Foreman in last situation.—R. CAMP, Shute Lodge, Axminster.

FOREMAN (or SINGLE-HANDED).—Age 25; experienced in Flower and Kitchen Garden, Fruit and Plant Houses, Forcing, &c. Good references.—W. W., 39, Wood Inu Hall Street, Oxford.

FOREMAN, in the Houses, or PLANTS-MAN, in a Noblemen's Establishment.—Age 26.—G. WOODMAN, The Hyde Lodge, Ingatestone, Essex.

NURSERY FOREMAN.—Twenty-five years' experience with Roses, Fruit Trees, Shrubs, &c. Could take charge of a Branch Nursery.—E. H. Kingswood Place, Railway Road, Teddington.

NURSERY FOREMAN, or to take charge of small Nursery.—Eighteen years' practical experience. Weatris, Crosses, Bouquets, Cut flowers, and all other articles.—G. CUMBERS, &c. Good references.—FLORIST, High Street, Milton, Stoke-on-Trent.

JOURNEYMAN (FIRST), in the Houses.—Age 24; eight years' experience, two years' good character. Highly recommended. Abstainer.—K., Beams, 58, High Street, Darlington.

JOURNEYMAN, Inside and Out.—Age 23; can be well recommended.—H. CROOKS, Hollway, near Cromford, Derby.

JOURNEYMAN, in the Houses.—Age 20; five years' experience, Inside and Out. Good character.—F. WOODWARD, The Garden, Porepoint, Farnham, Surrey.

To Head Gardeners.

JOURNEYMAN, for the Houses; age 21.—J. GODFREY, Ashwick Hall, Marshfield, Chippenham Wilts, wishes to recommend an intelligent young man as above. Can make himself useful in Kitchen Garden. Total abstainer.

IMPROVER, in the Houses, in a good establishment, where three or four are kept.—Age 20; three years' experience. Good references. A small weekly Premium. Bothy preferred.—E. LAMBERT, Horo Lane, Woodford, Essex.

LEARNER, of Outdoor Fruit Cultivation for London Markets.—Young; board preferred. Willing to work. Premium offered.—MR. REID, 5, Leconfield Road, Canbury, London, S.

TO GENTLEMEN and NURSERYMEN.—A young man (age 19) in a situation in a Gentleman's Garden or Nurseries. Three years in present situation. Good character.—J. MUSGRAVE, Crakelall, Bedale.

TO GENTLEMEN and NURSERYMEN.—Situation wanted by a young man. Understands Grapes, Cucumbers, Tomatoes, &c. No objection to be useful. Good character; handy at keeping his own tools. Good character.—J. G., 20, Southgate Road, Islington, N.

To Nurserymen.

A young Dutchman who has had experience in Nurseries to Holland and Germany seeks employment in a Nursery in England.—MEUWISSEN, Book-seller Gallery, Amsterdam, Holland.

ESTATE CARPENTER, and turn his hand to other work.—Messrs. FRANKS, 4, Caledon Road, West Croft, Carlshote, Surrey.

HOLLOWAY'S PILLS.—Easy Digestion.—These admirable Pills cannot be too highly appreciated for the wholesome power they exert over all disorders of the Stomach, Liver, Bowels, and Kidneys. They instantaneously relieve and steadily work out a thorough Cure, and in its course dispel Headache, Biliousness, Flatulence, and depression of spirits. It is wonderful to watch the remarkable improvement of the complexion, as HOLLOWAY'S PILLS Purify the Blood and restore Plumpness to the Face which had lost both flesh and colour. These Pills combine every excellence desirable in a domestic remedy. The most certain and beneficial results flow from the occasional use of this regulating Medicine; even persons in health, or after following sedentary occupations, will find it an invaluable agent.

ROYAL EXOTIC NURSERY, KING'S ROAD, CHELSEA, S.W.

NEW ORCHIDS.

Brought home by Mr. EDWARD WALLACE.

A NEW CATTLEYA, provisionally named C. WALLACEI. Collected in quite a new locality. The bulbs resemble somewhat those of a Trianae; the flowers nearly as large, but being SELF-COLOURED are like those of a large Eldorado splendens; lip, same colour as sepals and petals, WITH RICH ORANGE THROAT. MANY ARE PURE WHITE, others nearly so. VERY FLORIFEROUS AND FRAGRANT. 6-8 FLOWERS WERE SEEN ON ONE SPIKE. Flowers after C. Trianae are over. FROM A COOL LOCALITY, AMONG THE MOUNTAINS, ABOUT 3000 FEET ABOVE SEA LEVEL; and therefore as easily grown as C. Trianae. Dried flowers on view.

NEW EPIDENDRUM, provisionally called E. WALLACEI. In the way of E. Stamfordianum, BUT DIFFERENT AND FAR FINER; has much broader and shorter foliage (obovate) than that species; is MORE FLORIFEROUS AND RICHER COLOURED. Collected at an elevation of 1500 FEET ABOVE SEA LEVEL. Grows aloft, in tufts, on trees. The spikes are emitted in pairs from the base of the bulbs, and were seen to descend 1-2 feet, with 3-5 branches, and with LARGE ROUND BUNCHES OF WHITE OR ROSEY-LILAC FLOWERS; a most beautiful sight. Described by Mr. Wallace as like great BUNCHES OF WHITE OR RICHLIY-COLOURED LILAC. Plants breaking well. Dried flowers on view.

A NEW SOBOLIA-LIKE PLANT, bears bunches of flowers looking on the mountain side like MASSES OF SNOW.

A WHITE BLETTIA, found growing on the mountain slopes in grass and loamy soil; with a GRAND SCHOMBURGIIA, AND SEVERAL OTHER NOVELTIES.

THE NEW PLANT AND BULB COMPANY, COLCHESTER.

GISHURST COMPOUND, used by leading Gardeners, such as Red Spider, Mildew, Trips, Green Fly, and other Blight. 1 to 2 ounces to the gallon of soft water; 4 to 16 ounces as winter dressing for Vines and Orchard-house trees; and in lather from the cake against American Blight. Has outlived many preparations intended to supersede it. Boxes, 1s., 3s., and 10s. 6d.

GISHURSTINE keeps Buds dry and soft on wet ground. Boxes, 6d. and 1s., with the Trade. Wholesale from PRICE'S PATENT CANDLE COMPANY (Limited), London.

PURE WOOD CHARCOAL

FOR VINE BORDERS, FRUIT TREES, STRAWBERRIES, ROSES, FLOWER BEDS, POTTING PURPOSES, AND GENERAL HORTICULTURAL PURPOSES. HIRST, BROOKE & HIRST, Manufacturers, Leeds, YORKSHIRE.

THE Gardeners' Chronicle.

SATURDAY, JULY 17, 1886.

THE GARDEN IN MIDSUMMER.

AMONG the many pleasures of a garden none is greater than the return to it in summer, after an absence of some little time, and just now this pleasure is mine. True, the Apple blossoms are gone that I left tossed up against the deep blue sky. Poets and painters alike have tried to depict this fairest of spring's sights, but, as the rosy dawn breaking across the azure heavens vanishes while yet we gaze, so does the subtle beauty of the Apple bloom seem to escape the power of words and the most delicate touch of the artist's brush. I remember once, in an old garden, finding an Apple branch covered with bloom as tender as the rose lining of a deep-sea shell, and centred, almost smothered hide the blossoms, lay the nest of a goldfinch, embroidered with the pale grey moss or lichen with which age had clothed the stem of the old garbled tree. Softly swayed the branch in the summer wind across the clear blue sky, merrily hummed the bees around the blossoms, but the bird sat calm and still, with her crimson head above the silvery nest. As the Apple bloom has passed, so, too, have the Bluebells ceased to uprear their spikes. Very lovely were they on June 1, when the stems had grown so tall that the blossoms seemed to float as a blue cloud above the fresh green grass beneath the trees. The Gorse on the wide ground shows now but as a golden broidery, while some time since so massed together in many places were its blossoms that they looked like concentrated sunbeams, not a spray of green being left visible.

But if the sweet freshness of May be gone, the full richness of June has come; every leaf is expanded, and the shadows bring delightful coolness. The meadows after the late rains have a luscious growth, and are full of King-cups and honied Clover, while the seedling grass looks purple as it bends in the light breeze. In the garden, the Poppies hold sway. The great crimson Papaver bracteatum, with dark blotches at the base of each petal, and blossoms measuring a foot across, flings its wild arms in every direction—now, into a group of Iris dalmanica, among the pale mauve flowers that flutter with a delicious coolness around the fiery blossoms; now into a tangle of Scotch Roses, the snowy-white and crimson making brilliant contrast; then falling among the dark-leaved, silver-lined, sweet Rosemary, set with soft grey blossoms, that rest the eye beside the glowing Poppies.

But, brilliant as they are with the sun shining on them, more dazzling still do they appear with the sun shining through them, while sinking toward the west; then the light and brilliancy is that of rich stained glass: as they gleam like some old cathedral window one feels it is the hour of vespers in the garden. These Poppies are easily raised from seed, transplanted when of sufficient size to where they are to bloom. With a growth miniature in comparison to the oriental Poppies, Papaver umbrosum is just now very bright and gay; the slender

stems and fragile petals fanned by the light breeze have a wavering, fluttering motion, like the butterflies that hover round them. The dark blotches, too, seem deeper on the outer side of their shining petals than within, giving a very distinct appearance when the flowers are half closed. In good rich soil these Poppies produce a succession of blossoms during the early summer months, and are never so fine as from seed sown in autumn. Not far from these sparkling blossoms is a group of Iceland Poppies. They do not flutter in the breeze, but are like little bowls of beaten gold, and their colour, from pale yellow to orange-red, is most satisfying to the eye. Coming from such a northern latitude they are naturally indifferent to our winter frosts, waking up each spring into soft cushions of green to be crowned with blossoms a little later on. The Siberian Irises are beautiful in companionship with them, especially the variety orientalis, with its crimson spathe-sheaths and gem-like depth of colour. These Irises rather resent being moved, but once established are fair to see, especially if given a cool deep soil.

Growing against the wall and blossoming now for the first time is a tall tree of Abutilon vitifolium. Four years ago it was a little seed, now, after the spring's fresh growth, it covers a goodly space, and has quite forgotten that every leaf was torn from it in the winter storms. The flowers are exquisite in bud, of a soft pinkish tinge, changing as they expand to pale lilac and opening out quite round, and almost flat, but for the curved bowl-like rim encircling them.

Not far from this flowering shrub is a plant of Rodgersia podophylla. Well pleased with a peaty soil and shaded situation its noble bronzy leaves measure 30 inches across, and a spike of bloom moving like a white feather above the polished leaves adds to the effect. In a niche on the little rockery the Edelweiss is at last content, and consequently its flowers are large, soft, and of a pearly whiteness. It was only last year that a friend told me how best to grow this plant. "Give it," he said, "plenty of lime rubbish from an old wall," and following his bidding, the seedlings so planted are to-day large tufts of velvety-white, beside the deep crimson Dianthus crenatus. The heights of Switzerland need not be searched for this star of the mountain, when it can be so easily grown at home. But still, how dull and commonplace it seems to pluck it in the garden, compared with the alpine climb, the snowy summit far above, the intoxicating freshness of the mountain air, the wonder of the unknown scene; and then the flower itself, like snow shadows, brought home as a message from those lonely heights. The Edelweiss may be freely grown in our gardens, but the romance and mystery will remain in the alpine sphere.

The silver-frosted Saxifragas are now at their best, sending forth their long flower plumes, that fall over the cool grey rocks like the spray from a fountain; and *Erinus alpinus* is never so happy as in its self-found home in the chink of an old wall, blown there by the wind.

July 1.—June has departed, but she has left us her Roses. They are climbing over the trellis in all the abandonment of luxuriant growth, and the golden coppery hue of the Tea Roses, with their bronzy leaves, makes a beautiful background for other flowers. To-day it is the dark purple blue Larkspurs that are blossoming in front of the Roses, and show like church spires against an evening sky from which the flush has faded and only the golden light remains. While other flowers faint and tire in the strong sunshine these tall Delphiniums become more lovely every day. Clustered together in groups the fresh and plentiful foliage seems to protect the ground beneath from the scorching heat. But, fair as

they are with the yellow Roses for background, still fairer are they beside the old Rose *Cleste*. Here the Larkspurs of cerulean blue are the very sky itself in all its azure depth, and the Roses are like the fleecy clouds at sunset, that have caught the last rays of light as they float across the sky. Lilies are late with us, the white Moutagon being the only one in bloom. Growing beside the Spanish Iris "Thunderbolt," the tall Lily stems, bearing each from thirty to forty blossoms, mingle well with the dark Iris, which from the rainy spring is also tall and strong. This clouded Iris is of more vigorous habit than the type. Lifted and divided every few years, when the foliage has died away, and well decayed manure dug deeply into the ground before replanting, it has a bold and noble aspect, and the colouring is most unique. Beautifully as the flowers group themselves out-of-doors, it is pleasant sometimes to place those together indoors in a vase that one has not seen hitherto side by side. Before me at this moment, is a vase of clear Bohemian glass, and in it some soft lilac sprays of the tree Lupin, with a few gold and crimson single Gaillardias scattered through, and it is a picture fair to see.

Among rosy blossoms, none is prettier at present than the *Oxalis floribunda*; it appears to revel in the sunshine, never flagging under the most scorching rays, and tossing its bright flowers out on every side, until they form a complete wreath. The rosy *Erigeron* is another sun-worshipper; it is literally enveloped in a pink haze of Daisy-like blossoms. When the summer flowering is past, it sends up fresh heads of bloom late in autumn; even in the dark days of November it is lingering still, looking cheerfully upward with its eye of gold to bid us be of good courage. Then it is that we prize it most, for, with the flicker and sparkle of a thousand blossoms round us, winter seems far, far away. *L. A. L.*

New Garden Plants.

DENDROBIUM PERCANTHUM, n. sp.*

A new member of the antennate *Stachyobia* division. Never have I seen a *Dendrobium* with such a lip, just comparable to that of *Epidendrum glaucum*, Lindl. (D). Hence it is the type of a new group. The stems are very strong, shining like a Bamboo. The numerous racemes bear flowers equal to those of *Dendrobium macrostachyum*, but of a much stronger texture. Sepals triangular. Chin blunt. Tepals linear, longer, retrorse. Lip ligulate, trifid at the apex in a most singular manner for a *Dendrobium*. Side laciniae blunt rhomboid, central lobe ovate, apiculate. Five keels run from the base to the top, where they split to the mid-lacinia into even branches, so that one might believe that at some places there were but three keels, the lateral ones being contiguous. Sepals and petals of a sulphurous colour. Lip white, mid-lacinia and borders of the upper part yellow, keels brown, partly purple. This was kindly sent to me by Mons. Lucien Linden. It was gathered by the Lindenian collectors. *H. G. Rehb. f.* [Name from the Greek *perkos*, black-spotted? Ed.]

VANDA LINDENI, n. sp.†

This *Vanda* stands very near to *Vanda hastifera*, which was for a long time only known from one

* *Dendrobium percantum*, n. sp.—(Sto. hybrid antennate percantum); caule elongato valido modo calatum graphium crasso infero sulcato; racemis superne cæcis unid. floris, lacinis minutis; ovario pedicellate gracilibus; mento obtusangulo; sepalis tri-angulis; tepalis linearibus longioribus retrorsis, labello ligulato apice dilatato trifido, lacinis lateralibus semiorbibus rotundatis, lacinia mediana ovata apicula carnis quibus per longioribus n. n. velle approximata. Lateralibus in duo lacinae medie bifidis; columna trigona, superne dilatata, androchium pluridentata. Lus. Molucc. A. Linden. *H. G. Rehb. f.*

† *Vanda Lindenii*, n. sp.—*Ar. Vanda hastifera*; racemo laxifloro, plurifloro; sepalis tepalibus cuneato oblongis ovatis acutis undulatis, labello lacinis lateralibus rhombeis quadratis

plant in the hands of Director J. Linden père. No one imagined at that time that M. Auguste Linden would discover, and that Mons. le Directeur Lucien Linden would grow its nearest ally. It is dedicated to Mons. Auguste Linden. We are not accustomed to see the name Linden in connection with Asiatic plants.

The old *Vanda hastifera*, Rehb. f., has flat sepals and petals, light green, with dark blackish spots. The lip is tinted with dark and light mauve, and the central lacinia is hastate at the base, and at its top stand two varnished tumours, which might make a cynophile think of a double-nosed dog. A nice sketch in colours, prepared by the sagacious Sanderia traveller, I believe at Singapore, gives evidence of the plant having the same colours in Asia as it had in 1872 at Brussels. I have a fine Asiatic specimen from this. My young friend, told me the Malayan name signified "water branch." The fresh species has a rich raceme of flowers as large as those of *Vanda concolor*. Its predominant feature is given by the much undulated cuneate oblong blunt acute sepals and petals, which are light yellow, with much red in the disc and on the outside. The side lacinia of the lip are nearly square, or a little rhombic, whitish-yellow, with some black-purple spots at the upper margin. The mid-lacinia is of a most remarkable structure. It may be called triangular-ancipitous, going out into a sharp angle under two tumours at the apex, sulcate beneath, with a linear velvety ascending auricle at each side of the base, with three furrows over the disc and hairs of the shortest kind at the base. Of course it is very fleshy, whitish-yellow, with four purple lines over dist, purple spots on the two dog's nose tumours, and burnt sienna colour at the top under those tumours; spur conical, burnt sienna coloured at apex, hairy inside. Column yellow, burnt sienna coloured at the base. It is of Sondai origin. *H. G. Rehb. f.*

ODONTOGLOSSUM RIGIDUM, Lindl.

This appears to be a very uncommon plant in our collections, so that it has even been mistaken for *Odontoglossum aureum*. It has strong ovoid hard, rather dark bulbs, and linear ligulate acute leaves. A long sheathed peduncle bears a stately wide, more or less zigzag branched panicle. The flowers stand on long green stalked ovaries. Sepals and petals oblong-acute, the lateral sepals now free, now more or less connate at the base, often with a green keel on each side outwards, excepting this canary-bird yellow. The long stalk of the lip runs out into a square or nearly square obtusangulate blade, subcordate at the base, with an apiculus in the centre in front. There is some bidentate or tridentate callosity at the very base of the blade, just where it touches the stalk of the lip. The lip is of a fine chrome-yellow, thus giving an excellent contrast to the lighter sepals and petals. The trigonal column is green at the base, yellow at the top, and has very remarkable deflexed ligulate wings, with more or less prominent teeth. Its nearest allies are *Odontoglossum coelebatum*, Rehb. f. (*Oncidium coelebatum*, Lindl.), *Odontoglossum crocatum*, Lindl., Rehb. f.; *O. mystacinum*, Rehb. f., B. Zeit.; *O. aureum*, Rehb. f. (*Oncidium aureum*, Lindl.); *Odontoglossum festatum*, Lindl., Rehb. f.; *O. hemichrysum*, Rehb. f.; finally, *O. bicolor*, Lindl. The latter has never been seen, neither by Dr. Lindley nor by me, it having been described from one of Taiffala's pictures, copied at Lima by poor Matthews. My wild-gourd specimens of *O. rigidum* are from Hartweg, Jameson and Mandoo.

It was but quite recently that I had fresh flowers, I have to thank cordially for them Mr. Sillem, Laurie Park, Sydenham, who sent it, grown by Mr. Billiard; Mr. O. Wrigley, Bury, Lancashire, grown by Mr. Swan; and for very fine bulb, leaves, and inflorescence, Mr. W. Lee, Downside, Leatherhead. No one sends fresher materials than Mr. Lee, but there are numerous senders who think it is quite enough to have the flowers put loosely in a box, when they arrive shrivelled, withered, broken to pieces, and, the anthers and pollen apparatus of various species mixed. I remember more than a quarter of a century ago Mr. Walter Fitch, the excellent artist, told me he was disgusted at getting flowers not packed separately in paper. *H. G. Rehb. f.*

crectis, lacinia mediana triangula carnosa antice deorsum triangula ancipiti, superne gibberibus hemisphaericis de his collateralibus, medio per dissem quadrifidatis, basi versus velutina, utrinque basi auricula ascendentes lineari velutina cons. oca, calcari conico natis velutino, labello dimidiato apiculato; columna clavata. *H. G. Rehb. f.*

H A A R L E M.

It is oftentimes a matter for wonder why those who are in quest of pleasure or health feel bound to take their run upon the Continent during the autumn. If any consideration for flowers comes in it should be absolutely decisive against such a course. Not to say that the spring flowers are for the most part the best in any land, it is still to be remembered that there is a freshness about the meadow or hillside which only can be met with in the earlier months of the year, and nurseries and botanic gardens have not that used-up appearance at that time which they are sure to present in the fall. The nurseries of Belgium and Holland had for a long time been in my thoughts, and at last I found myself in the merry month of May en route for Haarlem itself. The stay at Ghent was but a short one, and the visit to Van Houtte's splendid collection of plants was necessarily very brief. "*C'est magnifique!*" was the encomium of the inkeeper with whom I was staying, and his words may be accepted as truth. The only fault to be found with it was, that it was in many respects over my head. Large glasshouses full from end to end of Orchids in the finest condition, others that were devoted to Palms, to Indian Rhododendrons, to rare Ferns, and especially one that might be called a temperate-house, and where a great many New Holland plants had been gathered together, were interesting to run through, and were very remarkable of Kew. I took down the names of a few greenhouse plants in which I mean to invest, and I am sure they may be recommended. The names are these:—*Doronia polygalifolia*, *Kennedyia ferruginea*, *Lithospermum fruticosum*, and *Cantua dependens*. The *Kennedyia* was exceedingly pretty, and apparently of a very free growth. The *Lithospermum* is doubtless very well known, but blue flowers are always acceptable, and when I saw it in such beauty I wondered that we make so little use of it for decorative purposes in England. I have grown *Cantua dependens* for some time, and at last I gave it up in despair, because it seemed absolutely to refuse to blossom with me. I expect from what I saw in this nursery that, after all, it only requires sufficient age. Comparatively small plants, but whose stems showed that they had long ago passed their minority, were well covered with bloom. No one can look on *Cantua dependens* doing well, and in its full glory, without wishing to have it, and the mental note that I made about this fine thing was, that it must be tried again, but with greater patience than before.

In Van Houtte's garden there is a department for everything: herbaceous plants in the open ground were rather backward this year, and Hyacinths, Tulips, and such-like have their head-quarters at Haarlem, to which place it was best to repair for them. For an hour or more before Haarlem was reached an Egyptian plague seemed to be upon us all. Dust entered the railway carriages though every window was closed, and sand, sand, sand, seemed to be everywhere. Soon long parallelograms of the brightest possible colours were stretching out on the right hand and the left, and bulb gardens declared themselves, where Tulips were all ablaze by thousands and tens of thousands.

The best gardens that I visited were those of Messrs. Roezen, Krelage, and De Graaf (at Leyden). M. de Graaf was unfortunately on a visit to England, but I think his wife put me in the way of seeing all that there was to be seen; and nothing could exceed the courtesy of M. Roezen and of M. Krelage. They gave me much of their time, and added to the interest of the visit in every way.

I have several times seen the question raised, Why cannot Hyacinths and Tulips become articles of commerce in England as they are on the Continent? Are there not large tracts of land which are as good for this purpose in our own country as those on the Continent? I dare say an affirmative answer might be given to this question, but it would not settle the matter. Later on I was talking to Herr Max Leichlin about this very point, and his reply to my question went down to the very roots of the business. He simply uttered the word "experience," and experience gives the explanation of all things. A Dutchman has been familiar with the mysteries of bulb growing from his youth, and there is no trouble which he is unwilling to take regarding it, and there are no minutiae which he considers to be too small to attend to. M. Roezen showed me in one of the fields through which we were passing, a barrowful of sick Hyacinths which

had been condemned, and were presently to be thrown away; but whoever could have picked out those sick bulbs from their fellows who were doing well but one whose eye had been trained to it by long years of practice, and who could "spot" a spot in a moment? I saw what he referred to when I took the Hyacinths into my hands and handle them carefully, but as to marching through several acres of bulbs and condemning the worthless ones at first sight, it would have been easier to fly; and yet apparently common labourers were doing this without any effort at all. I have often heard the question raised in England if bulbs like manure or not? and unless my memory is deceptive, the answer is often returned in the negative. The highest authority that we have for Lilies, I think, has said that with the single exception of *Lilium giganteum*, no Lily is in his opinion ever benefited by manure. It may be so, but it is not the practice of Holland. Sand and manure—manure and sand are the alpha and omega of all things. It should be said that of course the manure is in a very decomposed state, but a Dutchman relies on it implicitly, and the fields are enriched not only in the first instance, when they are recovered from some barren waste, but again and again, so that fertility may not be impaired. A bulb, it is true, does not like to lie in manure—it should be cushioned in sand, and the roots should push downwards into the rich provision from which they get vigour and life. This tends also to keep them from being ever burnt up in the summer. It is when the rootlets have nothing proper to feed upon that they come too much to the surface, and they cannot then stand the burning rays of the sun.

An emphasis should be put on the thorough decomposition of the manure, but it cannot be bad practice to use it in this way when such good results flow from it. Not so speak of Tulips and Hyacinths, I saw fields and fields of Lilies, which were perfectly innocent of shade, and yet doing quite well after this fashion.

It was most interesting to be initiated into the ways by which Hyacinths are mostly increased. Two methods are commonly used. A threefold incision from the base upwards may be made in the bulb, or the bottom of it may be scooped out altogether in the form of a cup. In the latter case, the shape of the bulbs will be best, and they come in quantities about the size of small Peas, and have to be grown on and on for a very long time. Hyacinth growers seem to recognise three distinct sizes for the market, of which the best and the costliest are for the most part sent to England. It takes six years before such bulbs are sent out, and they are during that period shifted several times from one kind of soil to another. In addition to all this, it would almost require a lifetime to have the properties—such, for instance, as their lending themselves easily to be forced, their readiness to multiply, &c.—of an innumerable army of Hyacinths, Tulips, and Anemones at one's fingers-ends. M. Roezen estimated his Anemones alone at a million.

It would baffle all computation to give the slightest idea of the number of Narciss, Tulips, Hyacinths, and of all sorts and kinds of things which are grown by him. But truly it was a gorgeous sight to gaze on the morning of a cloudless day on those great breadths of colour. Can anything in point of mere colour go beyond a Tulip field when every petal is thrown back to the sun, and they seem to be drinking in his rays. It is questionable whether anything could make a more vivid impression on the visual organs than they do; when looked at for any length of time they become quite dazzling. I feel as though I had never seen red or yellow before until I went to Holland.

It is not my province to enter here into the different qualities of hybridisms, of bizarres, and of breeders—these are Eleusian mysteries with which a professional florist is alone competent to deal; but some few names may be roughly given of flowers which struck me most at the time, and which I jotted down that I might act upon them later on. *Brutus* is a glorious yellow flower, with scarlet streaks on it. *Cerise Gris-de-lin* speaks for itself in point of colour. *Couleur Cardinal* and *Couleur Ponceau* are both very fine. *De Kaiser* is of dark scarlet hue, very large, and strikes one at once. *Joost van den Vondel* must on no account be omitted, for it is the most beautiful of all the white Tulips. *Pottebakker*, scarlet (*Form. Boem*), is very attractive. *Proserpine* excels in form. *Princess Beatrice* is a good double white that has yet to make her appearance in catalogues. *White Swan* will always hold her own, and with *Ophir d'Or*, *Rex rubrorum*, *Tournefol*, *Violet Superieur* (the four last

are doubles), the list comes to an end of those which made their way into my notebook. I daresay there may be many others as good or better than these, but for the excellence of those named above I can answer. Hyacinths had been for some time over in M. Roezen's fields, but *Narcissi* were still lingering when I paid him a visit. Most of them are like household words just now in England; and *Narcissus poeticus* *Vervaeis* is very distinct, and I was glad to make its acquaintance. Of course what is said of one collection of Tulips or Hyacinths may be pretty well said of another. It cannot be denied that there is a good deal of sameness in Holland, but it is a sameness that can well be put up with—it is not everywhere to be seen. I especially noticed that while florists' Tulips and Hyacinths seemed to be—if it may be so said—the great staple of the land, very many other things were evidently in favour as well, which are far too numerous to be named. M. Krelage's list of bulbs is simply bewildering. He very kindly pointed out to me some good things as he took me through one garden after another. *Leucocyan pulchellum majus* and *L. venustum fl.-pl.*, are both very good, and the latter is somewhat scarce. I greatly admired *Tulipa Ostrowskiana* (from Dr. Regel), and another called *sauvecolens sylvestris*, which differs from the type in being red, is very pretty indeed. T. Greigi was in fine form with M. Krelage, and some large beds full of dwarf Irises—*I. pumilia cinerea*, *I. lutea*, and *I. sulphurea*—were extremely effective. Cape bulbs must be well worth seeing in many places a little later on. At M. de Graaf's nursery at Leyden, *Narcissus Kaiser Wilhelm* seemed to me to be by far the largest *Narcissus* blossom I have ever seen; and *Maria de Graaf* and *I. Cecilia de Graaf* were very nice specimens of the garden varieties of *moschatus*. But what variety drew me most at that garden was a large patch of *Gladiolus Watsonianus*; it was very fine indeed, and doing well in one of the frames. *Lilium Thompsoni*, *Brodæa Huelletii*, and many other things might well have a word of praise, but the truth is it is exceedingly difficult to select, to know where to begin and where to end, where so much is so good.

I left Holland after a sojourn of a week there with many regrets. It need not here be said, that the country is unlike anything else, and has great features of interest. Flowers are not its only attraction, and a visit to the picture gallery at Amsterdam, and organ recitals at Haarlem, filled up many hours that could be taken from the main object in view. *A Wanderer*.

"HORTUS FLORIDUS."

So much interest was excited by the letters published some time since, concerning this bibliographical curiosity, that we are pleased to insert the following notes that have been obligingly furnished in a letter to Canon Ellacombe, at his request, by Mr. Krelage, who has added some comments on the very complete copy of the English edition in the possession of Canon Ellacombe.

The complete edition of the English *Hortus Floridus*, 1615 (oblong folio), as far as can be ascertained, consists of the following parts:—

1. Twenty-eight pages text (sheet A-G) containing—*a*, the English title, "A Garden of Flowers," &c., 4 pages; *b*, "The Booke to his Readers," 4 pages; *c*, "To the Reader Salute," 1 page; *d*, "The first booke, containing a very lively and true description of the flowers of the spring," 9 pages; *e*, "The second booke," &c., 4 pages; *f*, "The third booke," &c., 6 pages; *g*, "The fourth and last booke," &c.; and *h*, "The Translator to the Readers or Practitioners," 4 pages; *i*, a piece of poetry, signed T. W., 1 page.
2. Engraved Latin general title, with the portraits of Dodonæus and Clusius, marked "A.D. 1614. Extant Arnhem apud Joannem Janssonium. *Biblioth. ibid.*"
3. Engraved frontispiece (a garden with a lady and a gentleman looking over a hedge) to the first book.
4. Fifty-three plates (the first book), marked: *a*, 1—41 and 42—54; *or*, 1—52 and 54; *pl.* *pl.* 42 is pl. 52. In the copies in which pl. 42 is omitted, pl. 52 is always to be found; if a copy possesses pl. 42, pl. 52 is omitted. Of the greater part of the plates two editions exist: 1, one with insects; 2, one without insects on or near the flowers. In the English copy in Mr. Krelage's library is to be found, bound after pl. 54, an unnumbered plate showing an instrument for transplanting Tulips.
5. Engraved frontispiece (garden, like 3) to the second book.

Mr. Franken's remarks agree with my opinion on this point.
 f In three of Mr. Krelage's copies this frontispiece is the same as that under 3 and not under 4.

6. Twenty plates (the second book). The first edition of the Latin translation consists of 19 plates; the second edition of 20 plates.

7. Engraving representing Flora, with cornucopia, leaning against an Orange tree, with Cyclamen, Sunflower, and on a coat on the right hand, the epigram—

"Flora natura referens vices,

Exhibit blandas violas, rosasque,

Quicquid et digitis Arabes remittunt.

Spargit odorem. A. [B.]"

8. Engraved frontispiece to the third book (garden, without lady and gentleman, and with other flowers in the beds).

9. Twenty-seven plates (the third book). Pl. 1.—25, and two supplementary plates, viz. 13—14 and 25. The description of these supplementary plates is to be found in the English text, under Nos. 13, 14, and 25.

10. Engraved frontispiece to the fourth book (= under 8).

11. Twelve plates (the fourth book), marked 10—12D. *Remark on Books I. to IV.*—There exist different engravings of almost all the plates of these four books, differing but very slightly; for example, sometimes plates are numbered, sometimes not, &c. As for the English text, it is perhaps preferable to bring it in the book before the plates, as the signature of the sheets is not interrupted. A. to G.

12. Title to the second principal part: "Cognoscite," &c.

13. One hundred and twenty plates on 61 folios without text. (Second principal part.)*

14. At the reverse side of plate 120, in a typographic ornament, the words: "Finis coronatus."

REMARKS ON MR. ELLACOMBE'S COPY.

4. As to the omission of the text of plates 42 to 54 Miltitz in his *Bibl. Bot.*, Berol., 1829, remarks:—"1. Booke, textus fol. 5, tab. aem. 41, ut in priori editione (viz. the Latin edition), et preterea tab. 43—54 Tuliparum, quarum vero nulla in textu mentio." Pritzel, in his *Thesaurus*, has copied the above passage. Th. J. T. Arnold says, that "these plates 42 (3)—54 were published at a later date than the others, when the English and Dutch text had already been published." In the Latin edition the text of these plates is printed in verso of the plates. Miltitz seems not to have seen plate 42 (nor has Mr. Ellacombe); but it is the same as plate 52; it figures—*Tulipa Adriani Bilisi lutea rubris Annis elegans, ornata*, and *Tulipa Nob. viri Johannis Seulen aibi rubris maculis puncta*, vide "Franken, Les Van de Passe."

6. As to Mr. Ellacombe's question about plates 18 and 20: these represent 18 which is also missing in my English copy, but which I possess in my Latin editions: Caryophyllus fl. albo punctato, and Caryophyllus flos sanguineus; and Caryophyllus flore niveo. 20, Caryophyllus maximus col. carneo, Caryophyllus maximus variegatus.

7. This page seems not to be found in Mr. Ellacombe's copy.

9. In Mr. Ellacombe's copy the two supplementary plates seem not to be found.

12. The Latin general title, "Altera pars Horti floridi," &c., is not to be found in the English edition, neither are there found the four special Latin titles preceding the four books of the first part.

13. Plate 27—28 represents *Primula veris* and *Hortus*.

REFERENCES TO THE LITERATURE OF "HORTI FLORIDI." ENGLISH EDITION.

Monographs.

Cr. PASSERUS, "Hortus Floridus," door Th. J. T. Arnold, published in *Bibliographische Adversaria*, iii., No. 6, de la Haye, Mart. Nyhoff, 1875; and *Bibliographische Adversaria*, iii., No. 4, de la Haye, Mart. Nyhoff, 1876. Mr. Arnold gives a description of a complete Latin copy, not without some slight inaccuracies, but not of the English editions, which he probably never saw.

L'œuvre grave des Van de Passe, décrit par D. Franken, Dc. Amsterdam: Fred. Muller & Co., 1881, p. 265, No. 1346. In this excellent work very interesting notes are given on the history and works of the family De Passe. The author distinguishes six editions:—"1. Les planches publiées séparément sans numéro, avant les terrains, d'où sortent les plantes et avant les insectes (Cabinet des Estampes à Paris). 2. Sans texte (description des plantes) mais avec l'introduction en Hollandais, la planche de l'instrument pour dépoter les oignons en fleur, les terrains, &c. 3. Avec le texte Latin. 4. Avec le texte Anglais. 5. Avec un texte (7) toujours avec un titre en Hollandais, 6. Avec un texte (7) toujours avec un titre Français." Probably v. is the same as u.

About edition iv. is said:—"iv. Avec le texte Anglais.

* Mr. Franken supposes that the plates of the second principal part are engraved by an unknown German artist; probably they are not engraved by one of the De Passes.

Je ne fais que citer cette édition: je n'ai jamais vu d'exemplaire."

From all this it may be concluded that the English edition is the rarest.

The English edition is mentioned:—

1. *Bibl. Bot.*, a J. F. Seguirio digestus accessit *Bibl. Bot.* Bunnald, &c., 1749, p. 134. (1. Index librorum rei herbariae). "Translated out of the *Nederlandsch original* into English, 1615, m. 4, icon. 117."

2. *Bibl. Bot.*, auctore A. von Haller, tome i., p. 415, § 432. *Tiguri* apud Orell, &c., 1771. Von Haller copies Seguirio. Inexact.

3. F. A. Miltitz, *Bibl. Bot.*, Berolini, 1829, p. 82. Exact description of the English edition.

4. *Manuel du Libraire*; par J. C. Brunet: 3d edition, tome iii. A Bruxelles, 1821. "Il y a une édition d'Utrecht, 1615, in fol. obl., texte Anglais à laquelle on a ajouté les pl. 12—54 pour le printemps." Incorrect note.

5. *Thesaurus Lit. Bot. Cur.*, G. A. Pritzel. Lips. Brockhaus, 1851. No. 7796. Gives the English title and copies Miltitz.

6. *Guide to the Literature of Botany*, Jackson, 1881; § 12, early modern, p. 27. Mentions the first words of the English edition.

It may be observed that Gardiel and Pater d'Ardeue mentioned this work, and had a discussion about the existence of the Latin edition.

Tournefort, in his *Institutiones rei Herbarie*, tome i., p. 43, Paris, 1700, mentions:—

Editions 1614 et 1617 (Latin ed.).

Gardiel, *Histoire des Plantes qui naissent aux environs d'Aix*, &c., 1715, fol., p. xxxii. *Explication des Noms des auteurs botanistes. Icones Crispini Passeri*, 1667 [?].

"Quoique M. de Tournefort nous donne le titre de ce livre en Latin, l'ouvrage est pourtant en François. Je ne crois pas qu'il ait jamais été traduit en Latin [!] tout ce livre qui est en longa forma n'étant qu'un recueil de fleurs dont l'auteur en a donné d'excellentes figures. . . ." (Then he gives the French title). "L'on trouve au frontispice de cette même édition le titre Latin suivant fort différent de celui de M. de Tournefort: *Hortus Floridus*, &c. Je ne sçai si M. de Tournefort a eu en main une autre édition que celle que j'ai puisé qu'il l'a dit faite à Arnheim en 1607, la mienne est à Utrecht en 1614."

D'Ardeue, P. de l'Oratoire, in his *Traité des Revouées*, 3d edition, Avignon, 1763, p. 7; and in his *Traité de Tulipe*, Avignon, 1765, pp. 20, 79, mentions the *Hortus Floridus*, and differs in his opinion on the existence of the Latin edition with Gardiel. He possesses, too, the second principal part of the work.

Lastly we may refer to the different articles in the *Gardeners' Chronicle*, 1885, ii., viz., pp. 346, 362, 395, 439, and 469.

J. H. Krelage, Haarlem, Holland.

THE HIMALAYAN HEMLOCK SPRUCE, TSUGA BRUNONIANA.

I FIRST met with this graceful tree (fig. 14) on the banks of the Tambar River, in Eastern Nepal, in November, 1848, and have described it in my *Journal* as a beautiful species, forming a stately blunt pyramid, with branches spreading like the Cedar, but not so stiff, and drooping gracefully on all sides; and its surrounding scenery as grand as any depicted in pictures by Salvator Rosa; a river roaring in sheets of foam, sombre woods, crags of gneiss rocks, and tier upon tier of lofty mountains flanked and crested with groves of black Firs (*Abies Webbiana*), terminating in snow-sprinkled rocky peaks. Here one individual was measured, and found to be 20 feet in girth, at about 5 feet from the ground, and its concomitant vegetation was of many *Rhododendrons* (especially arboreum, Hodgsoni, Falconeri, and barbatum), *Leycesteria formosa*, *Thalictrum*, *Roses*, *Thistles*, *Alder*, *Oaks*, *Birch*, *Magnolias*, *Camellias*, *Eurays*, *Laurels*, *Barberries*, *Holly*, *Anemones*, *Strawberries*, *Raspberries*, an alpine Bamboo, and many other genera of the temperate and sub-alpine regions of the Himalaya. On another occasion, in the Lachen valley of Sikkim, I measured a Spruce that was 28 feet in girth and 120 feet in height. Nor were these very exceptional dimensions, though they greatly exceed what prevails in the Darjeeling district of Sikkim, for Mr. Gamble in his list of the trees, shrubs, and large climbers of that region, gives 60 to 80 feet as the average stature of this tree and 10 to 15 feet as the average girth at 4 feet from the ground.

The Himalayan Hemlock Spruce does not extend westward beyond Kumaon, where, according to Madden, it attains a height of 70 to 80 feet, and yields an inferior timber; eastwards it extends into Bhotan, where Griffith met with it at 6500 to 9000

feet, which is a considerably lower elevation than it affects in Sikkim, where its inferior level is about 8000 feet, and its superior 10,000 feet. The wood in Sikkim is little used, not being durable, but the bark is much employed for roofing.

In a geographical point of view the occurrence of a Tsuga in the Himalaya is interesting, as affording an evidence of the affinity of the flora with that of Japan and North America. The latter country, and especially its north-west territories, are the headquarters of the genus. On the sierras of California, Oregon, and British Columbia, three species are found—*T. Mertensiana*, *T. Pattoniana*, and *T. Hookeriana*; in Eastern America there is only one, *T. canadensis*, the type of the genus. One, *T. Sieboldii*, occurs in Japan, between which country and the Himalayas none have as yet been found, though it is most probable that one or more species will be found in the mountains of Western China. And this reminds me that the central region of the Himalayas, including Kumaon, Nepal, and Sikkim, is the most interesting on the globe as the meeting point of the types of many floras, which advance no further in any direction. Genera of the Malayan archipelago reach its hot humid valleys, but there they end. On its drier outer ranges, types of the Deccan flora reach their northern limit. In its temperate and sub-alpine regions are intermixed in profusion orders and tribes characteristic severally of Europe, Dahuria, China, Japan, and both eastern and western North America: whilst in its alpine and sub-alpine regions are representatives in numbers of the floras of Scandinavia, the Altai, Siberia, and the Arctic zone.

T. Brunoniana is a tender plant in most parts of England. At Kew it has been killed, and I have seen no good specimen nearer London than on a south slope near Leith Hill, and then only in a very sheltered and well watered valley. All the other species of the genus do well at Kew. J. D. Hooker.

THE COLONIAL EXHIBITION.

NO. VI.

Fiji.—The products of these islands occupy a comparatively small space, and though there is but little of absolute novelty among them there are, nevertheless, some of considerable interest. The Cocoa-nut and its products, as might be supposed, is fully represented, as well as Candle-nuts (*Aleurites moluccanus*), the oil of which is used for illuminating purposes; and *Dilodius*, the kernels of *Calophyllum inophyllum*, from which an abundance of oil is obtained having a high reputation for the cure of rheumatism. Tapa cloths are also abundant, the entrances to the court being hung with curtains of this material, which, as our readers will know, is the beaten-out bark of the Paper Mulberry (*Broussonetia papyrifera*). Amongst the many valuable woods that are found in the Fiji islands the "Viss" and the Sandal-wood will attract most notice, for here is shown a canoe cut out of a solid "Vesi" trunk. The tree which furnishes it is a leguminous one (*Azelia bigaya*), and the wood is heavy, close and even grained, and of an intensely dark brown colour. The natives use it not only for canoe but also for pillars for houses, bows in which to serve kava, war clubs, &c. The Sandal-wood (*Santalum yazi*) was, it is said, "at one time plentiful in various parts of Fiji; but in the early stage of settlement its destruction must have been most indiscriminate."

Under the name of *Bandia* Boxwood some blocks are shown of a remarkably hard wood, which appeared upon examination to be suitable for engraving purposes. It is, however, of a dark brown colour, which, it seems, unfits it for the better kind of work. Upon submitting a sample of this wood to an expert, he reported that the wood has no special claim in consequence of its dark colour. This, he says, considerably reduces the value, as it could only compete with inferior Box, which is at present supplied in sufficient quantity. He explains this objection by saying that "cutting upon wood is like drawing upon paper; if it is tinted, there must be a limit to the density of the tint, or your drawing will be absorbed by the tint upon which it is drawn. An engraver would have difficulty in observing his progress while doing his work." The plant producing this *Bandia* Boxwood is at present unknown, but it is stated that should it prove useful it could be had in any quantity up to two feet in diameter from Fiji, and the other outlying groups of islands in the Pacific.

Some fine masses of Kava root (*Piper methysticum*) are shown, also powdered Kava root. This, it will be remembered, is the source from whence the Fijian beverage called kava is made by masticating the root and ejecting and fermenting the saliva. It is known to have diuretic properties, and has latterly attracted some notice for its medicinal value in this country. Quite recently, indeed within the last few weeks, a spirit prepared from Kava root has appeared on sale at the refreshment bars in the Exhibition. It is

constant use that chiefs and people alike owe their robust health, in spite of the depressing influence of their tropical climate. This primitive and unsophisticated liquor regulates the action of the internal organs; it possesses remarkable soothing properties; it is a health stimulant, an excellent brain-feeder, a wonderful restorer of faded energies and of exhausted nerve-power. It is a preventive to gout and rheumatism. To those engaged in heavy intellectual labour it gives renewed energy. It is a veritable Elixir of

largely cultivated, and reaches its greatest perfection in the "Colo," or highland provinces of Viti Leon, the largest island of the group. All sorts of Tobacco seed have been grown, including Virginia and Latakia. The natives smoke their tobacco rolled up into "saluka" or cigarettes, the wrapper used being the dry leaf of the Plantain. Connoisseurs are very particular in the choice of their wrappers, and will only use the leaves of certain sorts of Plantains. Tobacco is an important tota of native life. Without it and kava no important discussion can be conducted.

NEW ZEALAND.

Amongst the products of the vegetable kingdom in this court timber and its manufactures, in the form principally of elaborate cabinet-work, holds a prominent place. Here we see some of the most beautiful pieces of mottled Kauri (*Dammara australis*) imaginable, certainly the most ornamental wood of the colony, also fine specimens of Hooneysuckle (*Knightsia excelsa*), besides which there is a good series of well named building timbers. A fairly good show is also made of Kauri gum, the resin from the tree mentioned above, which is dug up in large quantities and sometimes in enormous lumps, and used for varnish making. None of the lumps shown, however, in the Exhibition equal in size those we occasionally see in commerce in this country. Some of the specimens are curious, and will attract attention on account of their dark colour and admixture with coal. It is stated that this dark coloured gum was much in demand some time since, when the fashion prevailed for dark wood furniture, as the polish or varnish prepared from it greatly helped to deepen the colour. A small specimen of Kauri wood is shown with the resin naturally deposited on it—indeed almost covered with it—showing the abundance with which it is formed in the trunk of the tree.

The botanical visitor to the New Zealand court will not fail to note the fine mass of *Raoulia eximia*, the Composite plant which the colonists call Vegetable Sheep, in consequence of its forming large shaggy looking tufts on the mountains, which in the distance are readily mistaken for sheep.

CAPE OF GOOD HOPE.

Geographically considered New Zealand and the Cape are not near neighbours, but at Kensington a few seconds take us from one country to the other. The Cape collection will be remembered for its diamond washing and polishing, and for its ostrich leathers, and foremost amongst its vegetable products for its fine collection of woods and dried medicinal plants, and not less for its excellent *Official Handbook and Catalogue of Exhibits*. In the former the "Sketch of the Flora of South Africa," by Mr. Harry Bolus, F.L.S., already commented on in these pages, contains a great deal of valuable and interesting matter. The following description of the Karroo region will be read with interest:—"During periods of drought nothing can be imagined more desolate and mournful than the appearance of the vegetation; the soil is rarely covered, bare patches of greater or less extent intervening between shrubs and bushes. These are frequently blackened by drought as if they had been killed by fire. The largest, and indeed, almost the only trees are those of the *Acacia koida* (*Dorruboom*), which line the banks of the dry river beds as with a fringe; and occasionally on the higher mountain sides a few other trees of shrubby habit occur. For the most part the shrubs are scattered, and range from 5 to 8 feet in height, with intervening shrublets, 1 to 2 feet. Yet, after copious rains, all will be changed within a week or two, as if by magic. Many of the apparently dead bushes put forth bright green leaves; the shrublets are covered with flowers often before leaves can be seen; bulbous plants which may not have flowered for several years previously, send up their scapes with incredible rapidity, and annual flowering bulbs and grasses are everywhere seen where formerly all was bare and barren. Namaqualand, perhaps, exhibits this phenomenon to the most striking extent. I was amazed on visiting that desert country after the rains of June to July, 1883, to see tracts, hundreds of acres in extent, covered with sheets of living fire or glowing purple, visible from several miles' distance, caused by the beautiful Composite in flower; and nothing is more singular than to see this luxuriance intermingled with the black or white branches of dead shrubs, killed by previous droughts, standing like ghostly intruders on a scene of merriment and joy. These charming displays

FIG. 14.—TSUGA BRUNONIANA: HIMALAYAN HEMLOCK SPRUCE. (SEE P. 72.)

(From a drawing made in Nepal by Sir Joseph Hooker.)

a colourless liquid and is sold in square, white glass, capsuled bottles, with labels fully describing its virtues. It is called Yagona, the finest Kava Schnapps, or aromatic gin, and its value is set forth as follows:—"The active principle of this agreeable and splendid beverage is prepared from the root of the *Piper methysticum*, a species of Pepper. The root is called Yagona by the natives of Fiji, and from it they make their national drink, which is diuretic rather than intoxicating. Yagona has been the Royal drink of the Fijian and Samoan chiefs from time immemorial, and it is to its

Life. As a diuretic it is unrivalled, and it imparts a purity to the blood."

If the general use of the "Yagona" should be the only result of the Exhibition, it will finally have fulfilled a great mission!

A little *Handbook to Fiji and Catalogue of the Exhibits* has been issued under the authority of the Executive Commissioner, the Hon. James E. Mason, M.L.C., and this contains some interesting facts on the culture of the Cocoa-nut, Cinchona, Coffee, Cotton, Sugar, Tea, Tobacco, &c. Of the latter we are told that though it flourishes in all the islands of Fiji, it is most

pass away all too rapidly, and in a month or two little that is beautiful remains."

Mr. Bolus gives an enumeration of the plants found in this region which belong to very different natural orders, and remarks that the predominant feature of the region is the peculiar adaptation of its vegetable life to meet the severe conditions of the dry and hot climate and soil. Some idea of the appearance of the plants may be obtained from those which are used to give a character to the scenery surrounding the shuffal estiches, sheep, and goats in the case immediately to the left on entering the court.

To the catalogue referred to is an excellent list of medicinal plants and their uses, and also a valuable descriptive list of the woods. Of the *Kimssi* or *Kny-na* Box-wood (*Gonioma Kamassi*) we learn that until recently it was cut indiscriminately with other woods for fencing poles, but the discovery of its value as a substitute for true Boxwood has led to its stricter preservation. It has been reported upon by a London firm of wood engravers as "suitable for the finest mechanical engraving, such as machinery of all descriptions also adapted for ordinary engraving purposes." Further trials, it is anticipated, will lead to an export trade in this wood, which, by some, is considered superior to East London Box-wood, recently described as *Buxus Macowani*.

The concrete juice of *Euphorbia*, which has for late years been used in the preparation of a paint for coating ships' bottoms to prevent them fouling, is described as being sometimes used in King William's Town to destroy crabs, and as a blister, and it is also used by thieves to obliterate the mark on stolen stock; when the juice is rubbed on the animal's hide it turns the hair white. By rubbing their flanks against the stiff *Cactus*-like branches, horses often acquire white streaks on their coats, the hair becoming blanched where the *Euphorbia* juice has acted.

It may be as well here to correct a slight error that occurred in the notes last week under *New South Wales*, where, referring to the soft down which clothes the bases of the leaf-stalks of *Macrorhynchia spiralis*, the word pulse occurs where it should be *Pula*.

ST. JOHN'S FLOWER, FRUIT, AND VEGETABLE MARKET, LIVERPOOL.

VISITORS to the late show of the Royal Horticultural Society at Liverpool of a marketing turn of mind, doubtless paid a visit to St. John's Flower Market, situated in the heart of the city, and near to Lewis' vast emporium—the Liverpool Whately.

The writer of these remarks spent a short time in the market on a Saturday night, and the impression left (comparing it with Covent Garden Market) was that the Liverpoolians are slightly ahead of us in this important respect—while Covent Garden is closed as a market for a few hours in the early morning, and is therefore practically in the hands of the traders, in Liverpool—at any rate, on the great wage night—an all-important night—the most humble folk can go direct to the market and purchase at market prices what they wish in the flower, fruit, and vegetable line—in such a centre as Liverpool a great advantage. That the boon is appreciated was seen in the vast crowd promening up and down the various avenues in spite of the difficulties of locomotion. And then what a Babel of voices!—the vendors recommending their different wares in lusty, earnest, and at times hardly intelligible sounds.

It would be invidious, perhaps, to single out any of the numerous flower-stalls, yet in a necessarily hurried run through, those of Messrs. Fishlock Brothers, Mrs. Fenn, and the Liverpool Horticultural Company struck me as deserving of special commendatory notice. In each of these were to be found thoroughly representative displays of the flowers in season—bright and attractive exhibitions.

Liverpoolians seem to be "great" in wreath-making—some charming examples being on view—models of chaste and elegant arrangement. Water Lilies appeared to be specially abundant.

A few remarks by way of conclusion on the building itself, for which I am indebted to a local work, may not be out of place here.

The market was commenced in 1820, from the designs of Mr. John Foster, Corporation Surveyor, and was opened in 1823, when the market was hoally

removed from Castle Street. In point of convenience and adaptation to its purpose the market possesses one great advantage—that of simplicity—a right-angled parallelogram, surrounded by streets on the four sides, and intersected by avenues, longitudinally and transversely. It is simply a large area protected from the weather. The size of covered area is 183 yards by 45 yards, including not short of 2 acres, imparting a certain dignity to the erection.

To architectural merit it can hardly lay claim, the heavy carpentering of the roof, and the narrow space covered by each span, giving a feeling of lowness and almost gloom. Much allowance, however, must be made for the time when it was erected: sixty years have done much in the way of iron roofs, clear glass, and bold spans.

What a noble effect would be produced by a similar area, spanned by a roof similar to that of Lime Street Railway Station, and covered wholly or partially with glass!

The opening of the market did much towards improving the immediate neighbourhood, which until that time had been a noted locality, occupied principally by rope works without any thoroughfares. *Z.*

FRUIT AND FLOWER GROWING FOR MARKET.

THE vast quantities of Grapes, Strawberries, and Peaches grown by Mr. Ladds at his several places—Bexley Heath, Dartford Heath, and Swanley—in years past, will be quite put in the shade by this year's crop, especially at the two last-named places.

At Bexley Heath, where all the Vines are now arrived at a full bearing state, there is a fine show of fruit. The oldest Vines, *Alicante* and *Lady Downe's*, occupying a house 300 feet long by 25 feet wide, notwithstanding the extraordinary weight of fruit they have borne annually for nine years, do not seem to be in any way weakened thereby, as the crop so far appears to be quite equal to that they have produced before. The two houses of *Gros Colmar*, each 150 feet by 25, are wonderfully strong, carrying a splendid lot of bunches, as also are the *Muscats* with which another house is filled. The same applies to the adjoining house devoted to *Alicante*. The three houses, each 300 feet by 24, in the furthest part of the grounds, which last year were fruited the full length of the rods, are again bearing an immense crop, as even as if the bunches had been tied on by hand.

At Dartford Heath, in the four houses, each 130 feet long, first planted with Peaches, the trees now fill the space allotted to them, and are carrying a promising crop, averaging about 150 fruit each. Eighteen more houses, of similar size, have here been planted with Peaches: in two or three of these a large number of kinds have been put in with a view to test what varieties will best answer for market to come in at the time they are required. Here, and at Swanley, there have this season been 120,000 Strawberries grown in pots. Little forcing is attempted, the crop being regulated so as to come in to give a succession during the time that intervenes between those that are forced and the outdoor fruit. At the time I saw them (the beginning of June) the earlier portion of the crop was over, but the quantities that were ripe and coming on were such that a mere description conveys little idea of. Something like a score of the long houses at Dartford Heath were filled with them. The pots in all cases are stood on the floors. So placed in these low light houses, the growth, made slowly with only a little more protection, is in no way behind that which is made by forced plants elevated close to the glass in the ordinary way. In addition to the houses already named, there is a block of three spans, each 25 feet wide and 325 feet long; there are no divisional walls, the centre gutters being supported on brick piers. This represents a Strawberry bed considerably over half an acre, such as there can be little doubt in saying was never seen under glass before. Growers of pot Strawberries will not have forgotten the difficulty there was last summer through the prolonged dry weather in getting runners, and with the quantities that Mr. Ladds requires the difficulty was increased. In September I saw the runners in the course of being taken up and potted, and what with the lateness of the time, and the small size of the runners, the prospects of their yielding a crop did not look very bright; yet it is hardly possible that anything could have done better than these little plants. The most remarkable

thing about them was, that, although not showing more possibly than two-thirds the number of fruit that big plants will produce, there was a much larger quantity of large ones than usual; yea, which is just what the market growers require, as small fruit make little money, and with a stock of such magnitude as grown here, thinning is out of the question. The three spans mentioned were last year planted with *Gros Colmar* Vines, which, as often occurs under Mr. Ladds' course of cultivation, did not make much headway the first season on account of some other crop having to be considered before them. Last year the whole space was covered with *Tomatoes*, the treatment required by which, in the matter of comparatively little root moisture, interfered much with the growth of the Vines. This year they will be encouraged to make all the growth possible. Six more houses, each 300 feet long and several 100 feet, were being built, which fill up all the available space here.

At Swanley, in the ten houses, each 200 feet long by 17 feet wide, planted two years last spring with *Black Hamburghs*, each Vine has two rods. Last year they were allowed to carry six or seven branches to a rod, this year they have twenty to each rod, forty to a Vine; they will average about a pound each; they were just about stoning. If these Grapes colour, Grape-growers will begin to ask what weight of fruit Vines can be made to carry before they are over-cropped. Mr. Ladds has no misgivings on the subject, though no one knows better than he does that if the crop is deficient in this respect, coming in at the time that these will, their value will be much reduced. The strength of the Vines is such as leaves no indication that the fruit they bore last year had any adverse influence on them, and the shoots they have made this year are as strong as could be wished for. Nothing short of the extraordinary extent to which they are fed could sustain young Vines when cropped in this way. Two houses of *Alicante*, and three of *Gros Colmar*, planted at the same time, were carrying similar crops. In five houses planted with *Muscats* late last year, the Vines are going on well. Five others, planted at the same time last summer with *Gros Colmar*, are in a like condition. In the big house here, 650 feet long, containing *Gros Colmar*, each Vine having two rods, the rods confined to two bunches each, the Vines are in grand condition, and look as if they would gain strength enough to bear their full length next year.

In addition to the pot Strawberries grown here and at Dartford Heath many houses were filled with plants taken up from the open ground about the beginning of March and planted in rows. Quantities of fruit have been produced by these, the average of the crop being something like two-thirds that which the pot plants have yielded.

As will be easily understood, the Grape thinning is no small matter, and involves an immense amount of labour that brooks no delay. The work is got at as soon as the Vines are fairly out of bloom. Women alone are now engaged in the operation at Mr. Ladds' place; for a considerable time over fifty were so employed. For such a portion of the Vines as cannot be reached standing on the floor of the houses movable stages are used consisting of four upright pieces of timber with movable platforms that can be raised or lowered as required. These are each large enough to accommodate two women who can sit or kneel at their work as they feel inclined, in this way doing it with much more comfort than when standing in the usual manner. Not only is Grape thinning being now done by women, but they are also employed in flower-gathering, packing, and other light work.

Turning to plants, ten 200 feet long houses at Swanley were planted with *Marichal Niel* Roses, and, so far as the size of the plants would admit, have this spring borne a good crop of flowers. Ten similar houses contain *Gloire de Dijon*.

Winter-flowering *Heaths* are being grown in quantity, as well as *Genistas*, of which about 20,000 are coming on.

Carnation Gloire de Nancy, the favourite perpetual flowering white variety, is represented by immense numbers.

Twenty thousand *Manetti* stocks in pots, plunged out-of-doors, were in course of being budded, mostly with *Niphetos*, the buds to remain dormant; two buds are put in each just above the collar on opposite sides of the stem.

In the plant department at Bexley Heath the centre bed of one of the wide 300 feet long houses

was occupied by African Tuberoses as thick as the plants could stand, presenting a sight of these sweet-scented flowers such as I have not before seen anything to approach; many of the bulbs had from two to four spikes each; some that I counted had as many as sixty flowers on the spikes springing from a single bulb. Three dozen flowers to a bulb would be a moderate estimate of the crop.

The principal Gardenia-house, a double span, 300 feet long by 35 wide, contains a splendid lot of plants, all in pots, dense and bushy. Planting out was tried for some years; pots are preferred. In another house occupied by smaller stock of these plants there are numbers of examples in 48 sized pots, bearing as many as a dozen buds and flowers each. Here, as by most of the other market growers, Général Jacqueminot is the principal high-coloured rose that is forced. The plants are grown on so as to get stout and strong before they are used. In the spring, after the crop of flowers is gathered the plants are turned out-of-doors, and headed right down close to the bottom. Being full of vigorous roots they break strongly; about four shoots are retained to each plant, which, with attention and liberal treatment, get strong before the end of the season. Instead of making away with the old stock of Niphetos, and other Tea varieties that have been forced for a series of years, they are now headed down to within some 9 or 10 inches of the collar, and the stocks plunged out-of-doors. Plants that have been so treated were pushing up shoots as thick as one's finger.

Hydrangea paniculata grandiflora is grown in immense quantities; there is no hardy forced plant that is a greater favourite in the market than this. T. B.

CHICK-HOUSES.

In the *Gardeners' Chronicle* of August 15, 1885, p. 219, a correspondent, writing under the name of Bhundari, Dastypore, says, "I must take exception to an assertion in the *Gardeners' Chronicle* of June 29, in which the writer of the notes claims to be the originator of the chick-house, and must protest against the claim. 'Chick-houses' better known as 'Betel-houses,' have been used for ages in India for the cultivation of the Pan-leaf." While thanking the writer for his information, I would refer him to p. 734 of the *Gardeners' Chronicle* of June 7, 1884. I think I wrote plainly enough there for anybody. This is what I said:—"In 1871 I went to the Royal Botanic Garden, near Calcutta. I saw there that the then Curator, Mr. Scott, had been successful in growing Orchids and Ferns under a grass roof, such as is used by natives for growing the Pan Vine, a species of Piper. On returning to Lucknow I conceived the idea of trying a modification of what I saw in Calcutta, suited to a climate where a hot dry wind usually raged between March 15 and June 15—sometimes even later. In the horticultural garden I erected a house covered on all sides and top with 'chicks' of reeds, called 'Santha,' that is, the dry stems of the Saccharum moonjia. A 'chick' is a blind made either of these reeds or of strips of Bamboos, more or less thin, and fitted to doors and windows of Indian bungalows," &c.

Could any one have shown more plainly how the idea of a chick-house grew out of the idea of the Pan Vine-house, partially adapted to the Calcutta climate (whether by Dr. Anderson or his assistant, Mr. Scott, matters little), and then finally modified to suit a climate totally different from that of Calcutta?

The correspondent from Dastypore further states that had "those assertions been published in India they would barely pass unchallenged." Now, how does he think that the success of the Lucknow chick-house got abroad, so that one can hardly go anywhere without seeing a chick-house? I will inform him. My usual annual report, in which the success of the chick-house was mentioned, was published in the Oudh Government Gazette of the period, which was distributed to all officials in India. Whether the modified idea was reflected back to the Calcutta Botanic Garden, whence its original came, or not, I do not know; but this I know, the present palatial plant-house in the Royal Botanic Garden at Seepore was erected after the success of the Lucknow chick-house was published, and during the tenure of the present director, Dr. King. It is made of iron supports, covered with wire netting, to which are tied the leaves of a long grass, chick-fashion.

The correspondent from Dastypore rather objects to

chick-house, and would prefer "Betel-house." To call a house made solely of chicks a "chick-house" is as little absurd as to call a house made of glass a glasshouse. To call a house which has no Betel in it a "Betel-house" would be as if a glasshouse, in which Orchids are grown, were called a Tomato-house because on some former occasion Tomatoes may have been grown there. The chick-house goes by that name all over the North-west Provinces and Oudh.

As I originated the chick-house (not the Betel-house), I did not see why I should say that some one else did it. I gave the history of the growth of the idea both chronologically and morphologically, and I think that was enough. E. Bonavia, M.D.

Orchid Notes and gleanings.

ANGRÆCUM SEQUIPEDALE.

AT ROSEFIELD, Sevenoaks, this Orchid has been grown successfully four years in a Cattleya-house, nor is this the first time that I have seen and heard of it growing well in the temperature of a Cattleya-house; in fact, this remarkable Orchid is not at all difficult to grow if it be kept free from thrips, which prove to be a very troublesome pest when once allowed to get into the centre of the plants, and difficult to dislodge. The plants require plenty of water when making their growth, but much less when at rest in winter. In the same house the Japanese A. falcatum was in flower, and in good health. The flowers of this species, which are very small, and of the purest white, are produced in a cooler temperature than those of any of the others. The end of June or in July is the proper season for flowering.

In the cool house Mr. Cooke has made a good hit with *Disa grandiflora*; he has placed it near the glass at the end of the house, where the draught of the wind from the opening of the door would frequently reach the plants. They receive a plentiful supply of water at the roots. J. D.

DENDROBIUM DEAREI.

The more one has an opportunity of seeing this new species, more especially when the variety is good, and the spike one of good length, the more it seems to me we shall admire it. On an exhibition stage a large plant has somewhat of a reedy look, the long bulb being rather against its effectiveness, but in the Orchid-house, where we can get near to it and admire the flowers whilst overlooking the growth its purity and freshness, and its long-lasting qualities combine in my opinion to make this one of the most interesting and useful *Dendrobiums* of recent introduction. I enclose a flower cut from a plant now flowering with us which is just 3 inches across. The variety sent is much the best we have of several now in flower, though all are very pretty.

CELOGLYNE PANDURATA.

This curious Orchid does very well with us here, as you will see by the spike I enclose. We have a large specimen with seven spikes, bearing ten, eleven, and twelve flowers. Whilst lacking in the gorgeousness of many other plants, it certainly has a peculiar beauty of its own. The long drooping flower-spikes, bearing pale green flowers 3 to 4 inches across, with a lip of the same colour, strangely marked with black lines on the upper part, spotted with black on the centre crest, and a large black blotch on the front or lower part of the lip, are certainly markings not to be found on any other species in the manner we have them here. The lengthened lip adds also to its distinctness.

CATLEYA GASKELLIANA, VARIETY.

This very distinct and beautiful form is at present flowering very nicely with us here. The plant was imported about two years ago and is now in bloom for the first time. As you will notice, it is very perfect in outline. On the plant the flowers stand up very erect, and have no inclination to fall over as is often the case with this species. The flower is 7½ inches across. Sepals and petals light mauve, lip of the same colour, with beautifully crisped edges. The throat is of a lemon-yellow, whilst a band of clear white separates the mauve colour of the lip from the open throat. As a variety we have never seen anything

like it, and, needless to say, we think very highly of it. W. Swan, Howick House, Preston.

CATLEYA LABIATA VAR. MOSSIE, Lindl.

Mr. Vanner, of Chislehurst, has been so kind as to send me a fine flower of *Catleya Trianae* with side-sepals bearing each an orange-coloured central-stripe. Mr. W. Swan has just flowered at Mr. E. Wrigley's, Howick House, Preston, Lancashire, such a *Catleya Mossie* from a recently imported plant, and the just-named gentleman favoured me kindly with the fine flower. It has a most remarkable character, as on one side near the orange streak there are a few of those broken mauve lines which are characteristic of the *Mossie* lip; hence the flower has the tendency to form three lips in the way I ventured to call *trilabellia bicyclea*, the three lips belonging to the different whorls of the flower. This explained at once to my great satisfaction Mr. Vanner's fine *Trianae* flowers. H. G. Reib. f.

AGANISIA TRICOLOR.

A singular and beautiful species with creeping annulate rhizome, elongate-ovoid pseudobulbs, each bearing a single oblongate leaf. The flowers are borne in loose racemes, each flower about 2 inches across, flatish, with obovate-acute whitish segments tipped with yellow; petals of similar size and form, but bluish in colour; lip with a prominent orange callus near the base, disc saddle-shaped, purplish-brown. This, according to the figure and description given by Mr. N. E. Brown, is a very beautiful novelty to which the attention of collectors should be directed. It is a native of the Amazon district, and is figured in the last number of *Lindley*, t. 45.

TABERNEMONTANA CORONARIA AND OTHER SPECIES.

This plant, greatly resembling the *Gardenia*, is very ornamental in appearance, and from a like resemblance is often called Cape Jasmine. It is well deserving a place in every collection of plants, and if a small house or pit can be devoted to the plants so much the better, as they will then repay the cultivator for his pains. Their pure white flowers and delicate sweetness render them especially adapted for bouquets and buttonholes and other uses. There can be no objection to their use in large quantities, as the scent is very delicate. The plants can also be used when in full bloom for house decoration, standing the exposure and dry air of the dwelling very well. They also make good subjects for exhibition purposes. If only wanted for cut blooms they should, if possible, be planted out in pits or in beds in the stove, where a high temperature is kept up; if treated in this way the plants will flower for nine months in the year. A compost consisting of a mixture of loam and peat in equal parts, with a liberal addition of silver-sand and a little well decomposed manure, suits them. Bottom-heat is not essential to their good culture, and I have found that the blooms will last longer, and there will be a more continuous supply of them, without it.

A little more atmospheric heat is required when the plants are making their growth; when the growth is completed a cooler temperature may be given, applying more heat when they are wanted to flower. After blooming they should be pruned slightly, and be potted on starting. Propagate by cutting off half-ripened wood, which roots freely if plunged in bottom-heat under a bell-glass. The double variety, *Tabernaemontana coronaria flore-pleno*, is far the best; *T. cymosa* is also good, and well deserves to have more attention paid to it. *T. grandiflora* is somewhat rare in collections, and produces its flowers in August and September, and the season of flowering may be prolonged until the other varieties come in for the winter supply. J. Evans, Haslemere.

LANTON'S "NOBLE" STRAWBERRY.—This variety precedes *Excelsior* by from seven to ten days. The plant is a vigorous grower and fertile; fruits large, of a deep crimson colour, in appearance like *Keen's* Seedling. The flavour has a slight acidity, reminding one of *Eton Pine*, and this season it is poor in flavour, possibly from the deficiency of sunshine. It is a seedling from *Forman's Excelsior*.

ORANGE FUNGUS OF ROSES:

COLEOSPORIUM PINGUE, LÉV.

UNDER the name of *Coleosporium pingue*, the "orange fungus" or "red rust" of gardeners has been familiarly known to botanists for at least twenty-eight years. Before that time it was called *Uredo rosea*, *U. pinguis*, *U. ciliata*, and no doubt other names. In different stages of growth the fungus differs, in colour, from pale sulphury-yellow, through vermilion to black, and in each of these stages it has received different names, the names (or variety) being at times interchanged. During late years, with the progress, or supposed progress, of discovery, other names have been given to the "orange fungus" of Roses, and to make "confusion worse confounded" the old name of *Coleosporium pingue* has of late been obliterated and left out of text-books, even as a synonym. It is not even indexed by Dr. Winter in Rabenhorst's *Kryptogamenflora*. "Orange fungus" has long been known in this country as one condition of a fungus named *Phragmidium mucronatum* or *Aregma mucronatum*, but if the index of Dr. Winter's volume is referred to, neither of these names will be found. The followers of Dr. Winter in this country of course imitate their chief, so that to all but advanced botanists "orange fungus" has no botanical name at all, and cannot be found under old and familiar Latin names in the more advanced books. When gardeners write of Vine mildew they call it the *Oidium*, when of the Potato fungus, the *Peronospora*, but when they write of "orange fungus" they simply call it "orange fungus," because they dare not venture on a botanical name. One cannot be surprised at gardeners turning away with disgust from the wordy verbiage of modern text-books. The newer mycological priests are so intent on the utter destruction of the older beliefs that they will not even print the familiar old names as synonyms as slight indications of what former priests taught us but a very few years ago!

"Orange fungus" of Roses has been especially unfortunate in the treatment it has received from botanists, not only in the different names it has received and the total obliteration of its most familiar names, but especially in the definition of its characters. The characters of the different stages of growth of this fungus have been so altered, "enoded" and "cooked," that it is quite safe to say the fungus has almost every character of which a fungus is capable of gracefully bearing. It has as many and as few characters as names, and advanced teachers are always cutting off or squeezing in new characters to make it fit into some pet theory. The theory is never modified to suit the fungus, this would show fallibility on the part of the teachers; poor feeble Nature is clipped, and squeezed, and added to and inflated, as the case may be, so that a wretched fungus may be driven by book or by crook into one of the labyrinths of a cut and dried theory. Mr. Berkeley, in writing of all the British species of the genus *Coleosporium*, says, "we cannot find distinctive characters."

I will endeavour to explain in words as simple as possible the nature of "orange-fungus." It exists in three forms, which gradually run into each other on the leaves and stems of Roses, and these forms gradually vary in colour according to the season of the year. It is very seldom that all three forms are found on one Rose bush or on one Rose leaf, but on rare occasions all three conditions may be found growing together, as illustrated in fig. 15.

In its first stage of growth the fungus is sulphury or creamy yellow. In this condition, as at A, fig. 15, it has long been known as *Lecythea rosea*; in its mid-summer stage it is brilliant cinnabar-red, or vermilion, in colour, as at B; this is the familiar *Coleosporium pingue*, or "orange fungus" stage. At length it is jet black, as at C, and this is the old and equally familiar *Phragmidium* or *Aregma mucronatum* condition.

I quite agree with the majority of observers who conclude that the three forms belong to one fungus, although some botanists think, or once thought, differently; for instance, Le Moine and Decaisne say the third form is a "parasite" on the second, and that a similar parasitism is of "frequent occurrence."

If the sulphur-coloured *Lecythea* is taken first, and a fragment of a pustle enlarged in section under the microscope 400 diameters, it will be seen as in fig. 16. The spores are at first smooth, then almost invisibly spinulose, they are nearly colourless, and are filled with irregular masses of protoplasm, and

shown at D; round the entire margin of each pustule is a fringe of elongated bodies, shown at E, termed paraphyses—these paraphyses are probably abortive attempts of Nature at the production of the stalked spores.

The teachers who obliterate the old landmarks and suppress names wish it to be believed that the three stages of growth in "orange fungus" agree with *Æcidium*, *Uredo*, and *Puccinia*; the teachers are in this case at their wits' end for an *Æcidium*, so the *Lecythea* stage is squeezed in as a gingerbread *Æcidium* condition. To an outsider it is remarkably

FIG. 15—ROSE LEAF, NATURAL SIZE, WITH "ORANGE FUNGUS" IN DIFFERENT STAGES OF GROWTH.

unlike an *Æcidium*, and is as remarkably like an immature *Uredo* (it is described under *Uredo* in some books); the paraphyses, &c., too, are like *Puccinia*, and unlike *Æcidium*; but we are cooly told that in the instance before us the presumed *Æcidium* and *Uredo* stages are "not to be easily distinguished." The eye of faith is required. A large amount of faith is requisite in the proselyte who accepts the sulphur-coloured condition of "orange fungus" as a poor relation of the *Æcidium* of *Barberry-blight*. To me it is no *Æcidium* but a mere early condition of the next or *Uredo* stage of growth—the suppressed *Coleo-*

FIG. 16—EARLY CONDITION OF "ORANGE FUNGUS" OF ROSES (*LECYTHEA ROSEA*): ENLARGED 400 DIAM.

sporium stage. The name of the first condition—*Lecythea rosea*—has of course been suppressed.

Sometimes *Lecythea* is accompanied by so-called spermogonia and spermatia; the names are meant to indicate a sexual function; if sexual, the result must be a resting-spore condition; but *Lecythea* spores are not resting-spores; the resting-spores are produced in the last, or black stage of the fungus.

A section through a fragment of the *Coleosporium* or "orange fungus" condition is shown colored 400 diameters in fig. 17. Here the spores have become much deeper in colour, the wall of the spore is thicker and somewhat more echinulate than in *Lecythea*, and the protoplasm is coarsely granular. Perhaps the fungus before us is not a "good" *Coleosporium*,

especially when viewed in the light of the fact that teachers are always "emending" fungus characters to exclude "shady" species that interfere with theories, and so are not wanted; and to bring in other "shady" growths that happen to be badly wanted, to give dubious support to a theory. As no new name has of late been invented for "orange fungus," let gardeners stick to the old one and still call it *Coleosporium pingue*, although it is at the risk of some superfine mycologist one day telling a learner that he cannot "apprehend" what he means, and that the name is not to be found in the indexes, even as a synonym.

We now come to the black or *Phragmidium mucronatum* stage, as shown, enlarged 400 diameters, in fig. 18. *P. mucronatum* has also now been professionally wiped out, and a new name substituted in *P. subarticatum*; rightly or wrongly I know not, and do not care—life is too short for one to be always hunting down fungus names; it is sufficient to say that the old *P. mucronatum* (like the *Coleosporium*) does not now even exist as a synonym. The name has been stamped clean out of existence by a school of youthful and over zealous teachers, so that no trace can be discovered unless fragments are carefully and laboriously sought for and put together for printing in the *Gardeners' Chronicle*. All gardeners who look at the three handsome compound spores, taken from a fragment of a black *Phragmidium* pustule, will, I think, agree that they are very handsome, well grown fellows. It almost seems a pity to advise the destruction of them by fire. An immature example is shown at fig. 18 F, and the peculiar manner in which the outer of the two membranes of the stem breaks away from the base, is shown at G.

The *Phragmidium* is essentially the resting-spore condition of the fungus, and it is by the black *Phragmidium*, which rests in decaying Rose leaves and stems all through the winter, that the *Lecythea* and *Coleosporium* stages are reproduced each summer.

The *Coleosporium* is the genuine "red rust" fungus which potentially agrees with the "red rust" or *Uredo* of corn. It produces a vast number of bright red spores, which constantly reproduce the *Coleosporium*, but the "orange fungus" or "red rust" would utterly perish each year were it not for the black resting spores of the *Phragmidium*, every segment of which will after a six months' rest germinate and produce sporidia, which sporidia give rise to the sulphur *Lecythea* and orange *Coleosporium* of early summer. It follows, therefore, that when Roses are badly affected with "orange fungus," as they are this year, that the spring (as the wet spring we have passed through) was favourable for the germination of the black *Phragmidium* spores which were produced on Roses last year. These *Phragmidium* spores rested till the advent of the abundant warm showers of the spring, when they germinated, and by their sporidia gave rise to "orange fungus."

Red-rust should be looked for each year in its inconspicuous sulphury stage, and failing this, at the first appearance of the orange stage. If all the "orange fungus" could be destroyed no black *Phragmidium* resting-spores would be produced. If the *Phragmidium* could be utterly destroyed any one autumn, no *Lecythea* or *Coleosporium* could appear in the summer. Mr. Berkeley, in writing of "orange fungus," has said:—"It is so very common that the affection is quite beyond any remedy. Every hedge will diffuse the fungus if you could for a moment drive it out of the garden." Mr. G. Baker, Vice-President of the National Rose Society, says, in the *Rosarian's Year-book for 1882*, that "orange fungus" chiefly attacks the "lower leaves of the smooth-wooded class of Rose plants, such as Victor Verdier, Comtesse d'Oxford, Hippolyte Jamin, and the like; but it is worthy of remark that neither Madame Clemence Joigneaux, William Warden, or Edward Morren, and those of the same character of foliage, &c., are seldom subject to these forms of fungoid disease." If gardeners would send the names of a few Roses that appear to be generally or always free from "orange fungus," the list might lead to good results and further useful observation. Mr. Baker publishes a good suggestion for the prevention of the annual reappearance of this pest in gardens. He says, "This can be attempted by raking off all loose materials and as much of the soil as possible, and burning them. At the same time," he says, "give the ground a good dressing of quicklime. The burnt

soil and other matters can be returned to the Roses, greatly improved by the change they have undergone." The raking and burning, and the application of quicklime, necessarily destroys the resting-spores of the Phragmidium. Mr. Baker says, "At pruning time carefully collect everything cut from the plants and destroy it; then give the plants—stems and branches, stakes and ties, if any—a good coating of the following mixture, applied with a suitable brush:—Quicklime and soot, mixed to the consistency of paint, in a pailful of which add half a pound of sublimated sulphur, and a small handful of coarse salt; stir and mix well together before applying. The object being to destroy the resting-spores of this troublesome fungus. I have tried washes of all kinds, carefully syringing and brushing over the leaves with various compounds, but with little success; and in some instances finding the remedies even more fatal than the disease. I have most faith in an infusion of Hellebore root, 4 oz. to half a gallon of water, then add half a drachm of the bichloride of mercury (first dissolve the mercury in a little spirit), and lastly, add half a gallon of lime-water. I have certainly seen good results from this application, though I must also admit it has sometimes failed." Mr. Baker's plans, therefore, are reasonable attempts at destroying the resting-spores on and in the ground in the late autumn by raking and burning, and by the application of quicklime; destroying any resting-spores on the old stems, branches, and stakes, in the autumn, by a corrosive wash; and by an application of another wash in the summer, which is supposed to make the surface of the stems and foliage unsuitable for the germination of the spores in the "orange fungus" or Coleosporium stage. The washes of course cannot reach the interior of the stems and leaves where the mycelium or spawn of the fungus vegetates.

It is essential to remember that in every stage of growth "orange fungus," or "red rust," vegetates inside the leaves and stems of the Rose, when it is well advanced in growth inside it bursts the membranes of the Rose and litters its spores outside. The "red rust" spores germinate quickly and spread the mischief at once, whilst the black spores produced in late autumn rest in the dead refuse of Rose bushes, on or in the ground, and germinate in the spring after six months' rest.

The effects of "orange fungus" are well known. When the pest attacks the plants very early in the summer, as in the present year, the leaves drop and the branches become naked and disfigured. The wood does not ripen, and so being in a bad state it dies in the winter, and the bushes consequently get into a weak and unsatisfactory state, or sometimes die in the next spring.

"Red rust" is not confined to garden Roses, it may be found in its various stages of growth on the Dog Rose, *R. canina*, and *R. collina*, Sweet Brier, *R. ruginosa*, the wild *R. arvensis*; *R. pimpinellifolia*, *R. cinnamomea*, *R. turbinata*, *R. rubrifolia*, *R. alba*, *R. tomentosa*, *R. gallica*, *R. centifolia*, and others.

A closely allied fungus to the Coleosporium and Phragmidium before us is a parasite extremely common on Brambles; this is Phragmidium bulbosum. Every boy or girl who has gathered Blackberries in the autumn, must have observed the profuse production of black resting-spores of this species on the underside of the leaves of Blackberry bushes. The familiar old name of this fungus—viz., *P. bulbosum*—has (like all the others) been quite wiped out: but as it does not just now specially concern us what has been done with it, or how the old species has been transformed, we will leave it, merely pointing out the fact that the name, like every other name mentioned in this article, does not appear in the newer indices.

Baron Thibmen has written on the diseases of Roses, and I will conclude this brief paper with a quotation from him, so that gardeners may take note. Speaking of "orange fungus" he says, "This disease is of less consequence than other Rose diseases. [...] It is due," he says, "to a fungus named *Cœoma minutum* [name not in latest published indices], which rarely appears on the leaves. [...] It forms cushion-like projections, of an orange-red colour—the *Æcidium*." [...] Other authorities teach that the sulphury Lecythis is the unhappy *Æcidium*. In conclusion Baron Thibmen says the disease is usually not very fatal, but when fatal it is better to burn the plants! Gardeners, take notice—don't preserve the dead plants. *W. G. Smith, Dunstable.*

Foreign Correspondence.

ORANGE CULTURE IN SAN FRANCISCO.

In a recent Government report on the products of San Francisco, it is stated that there are about 12,000 acres planted in Orange trees in Los Angeles County now bearing fruit, and several thousand acres in

FIG. 17.—"ORANGE FUNGUS" OF ROSES. ITS TYPICAL AND MIDSUMMER CONDITION (COLEOSPORIUM PINGUIF); ENLARGED 400 DIAM.

young trees, which will begin to bear fruit in from two to five years' time. In San Bernardino County the Orange crop has, at intervals of from three to four years, been greatly damaged by frost. At less frequent intervals the same trouble has been experienced in this country.

Oranges are being shipped from Mexico to the Eastern States. Should the reciprocity treaty come into effect, the consequences will be very serious to

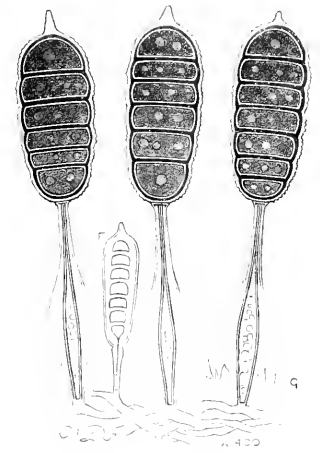

FIG. 18.—"ORANGE FUNGUS" OF ROSES. THE AUTUMN AND WINTER, OR RESTING-SPORE CONDITION (PHRAGMIDIUM MUCRONATUM); ENLARGED 100 DIAM.

Orange growers here. The present duty is sufficient to protect Californian Orange growers from competition with the cheaply-produced Mexican article. As the Mexican Oranges are of better quality their admission free of duty would cripple the industry here.

The "white scale" is still doing immense damage to the Orange trees. Some of the oldest Orange orchards in the country are being topped and pruned to such an extent that they will not bear any fruit for several years. In some cases the trees are being cut down. No cheap effectual remedy has as yet been

discovered to destroy the insect; it is stated, however, that another insect has appeared which preys on the "white scale," and is not injurious to the Orange tree.

TREE PLANTING IN HONG KONG.

It seems that the authorities in the Hong Kong Botanical and Afforestation Department are planting trees on a very large scale, for we notice in the report for 1885 the following figures:—*Pinus sinensis*, 342,302; *Eucalyptus* (fourteen species), 16,408. In addition to the above number of *Pinus sinensis* trees planted, there were sown in sites as many as 204,838. Other trees, which are not so well known to us here, were also planted in considerable quantities.

The soil is rather variable, and the failures chiefly occur on the steep slopes, where the grass is scanty. Where the ground is covered with a fibrous carpet of grass roots the rain, as it rushes down the slopes, is absorbed in sufficient quantities to saturate the soil and render it suitable for the reception and subsequent development of the young tree; but where the ground has been denuded of its herbage by the irrepresible grass-cutter with his blunt sickle, which does not cut but uproots the grass, the young tree is sorely handicapped in the struggle for existence.

The fourteen species of *Eucalyptus* were raised in various quantities. Each species was planted in a clump, and marked with a ticket so as to identify the different kinds, and note their relative adaptability to the soil and climate of Hong Kong. This comparison has been very interesting, and will be valuable in enabling to select the most suitable kinds in future. The three species that are conspicuously superior to the others, and which may be considered an unequalled success, are *E. robusta*, *citriodora*, and *tereticornis*. The next in order are *marginata*, *platyphylloides*, *corymbosa*, *resioifera*, and *haemastoma*. These five kinds have not done so well on the exposed hills near the Military Sanitarium as the three first-mentioned kinds, but they have succeeded very well at Sökongpó, where the position is more sheltered; and the reporter has no doubt that they will succeed in many of the unexposed parts of the island. Other four species, namely, *Suaertia*, *siderophloia*, *microcarpa*, and *maculata*, have grown moderately well. The percentage of deaths is small, but the growth is slow and weakly. They evidently required a richer soil than the above mentioned sorts. The two species that have been least successful are *phularis* and *hemphloia*. A large proportion of both kinds have died, and those that have survived have not a promising appearance.

It is also stated in the report that 10,000 young Camphor trees were raised during the season in Kowloon nursery, and will be planted out as soon as the weather is suitable. Preparations were made in the nursery at Sökongpó for raising a similar quantity of Camphors next summer, but Camphor seeds are very scarce this year, and the price has risen 400 per cent. It has therefore been decided to sow the ground with pine seeds instead.

VITIS MARTINI.

The Superintendent in the report of the Botanical and Afforestation Department of Hong Kong, 1885, states that this "new tuberous rooted Vine from Cochinchina fruited this year in Hong Kong for the first time. The seeds were procured from the Botanic Gardens, Saigon, in 1883. The seedlings were planted out the same summer and made several shoots, each of which died down in the winter. They began to make fresh shoots about the middle of April, 1884, and grew well during the summer, but showed no inclination to flower; and again died down in the winter. Last summer they started vigorously, and showed flower about the end of May. Many of the bunches, however, failed to develop fruit, owing apparently to imperfect fertilisation, but there was a good average crop of bunches on the canes irrespective of the failures. The fruit was ripe in October, many of the bunches weighing 1 lb. each. The berries, when ripe, are jet black, and rather under the average size of ordinary Grapes. The seeds are large in proportion to the size of the berry. The flavour is a peculiar blending of sweetness and acidity, very pleasant, but tending, in my case, to leave a curious smarting sensation on the tongue; others might not find this peculiarity at all objectionable. The flavour might be altered, as is well known, by varying the mode of cultivation, but the size of the seeds is likely to prevent the Grape becoming popular

as a table fruit; it may, however, be very well adapted for a wine producer. A number of seedlings of this Vine were distributed amongst residents of the Colony, but I learn that none of these plants have fruited. A few remarks as to the mode of cultivation may therefore be useful. The tubers should be planted at a distance of 12 feet apart in well manured soil, taking care to keep the surface near the surface, as the tubers take a horizontal direction and do not penetrate the soil to any great depth. When the shoots appear in the spring it is well to cut off all the weak ones, leaving only four strong canes; these should be trained along a trellis or a wall, as the case might be, leaving a width of 3 feet between the canes. All the lateral bunches should be pruned back to within one bud of the main rod, except those laterals that show bunches; but it will be found that very few bunches will be developed on the lateral shoots, most of the bunches springing directly from the main rods; but in the case of a bunch springing from a lateral branch the branch should be stopped at the second bud above the bunch. The laterals might be allowed to grow till they are 2 feet long. It will then be seen if they are likely to throw out bunches or not. If not, prune them back as described, and also pinch back all subsequent growth as it appears. It may be found necessary to thin out the leaves to allow the sun to get at the bunches, but in doing this great care should be taken not to break or otherwise injure the leaf directly above the bunch. If this leaf happens to be accidentally removed the bunch below it will ripen immaturesly and soon shrivel up. It is an advantage to thin out the bunches, leaving a space of 15 or 18 inches between them. It is also advantageous to thin the berries, leaving hardly one half of the original quantity on each bunch; but I am afraid this process would prove impracticable if the Vine were extensively grown, owing to the labour it would entail. After the fruit is gathered the Vines require no further attention till spring. By way of experiment one lot of plants was allowed to grow at will. Some of them threw up as many as a dozen suckers, and produced laterals in profusion, but they all failed to flower. Another lot was transplanted into well-manured ground just as the crowns began to push in the spring; they, too, failed to flower, and presented rather a sickly appearance during the summer.

"The Horticultural Press has already suggested that this Vine should receive the attention of Vine-growers in the wine-producing countries of Europe where the Phylloxera has denuded the vineyards of the old class of Vines. There being no Phylloxera in Hong Kong, I cannot say whether the dreaded insect would spare this Vine; but in view of the wonderful improvements that have been and can be brought about by skillful and persistent cultivation, it is not unreasonable to surmise that this new Vine may ultimately become a wine producer. It is easily cultivated, and seems to be well adapted for a tropical climate, or a climate in which the resting season is comparatively cold and the growing season hot."

THE PENTSTEMON.

I MAY say in answer to "Soixante" that before writing the article alluded to last week, I had added to my practical knowledge by carefully searching the old authorities and examining the coloured plates published during the present century. I suppose one ought to take nothing for granted, but I had also written some years ago about the Pentstemon in the *Gardener's Chronicle*, and stated that P. gentianoides was the parent of most of the garden varieties. My remarks are in vol. xii., n.s., p. 589, and are as follows:—"Probably P. gentianoides is the parent of most of the fine varieties at present in cultivation, although it is not improbable that some of the varieties with large broadly-opened flowers owe their most valued characteristics to that beautiful late flowering species, P. cobaea."

At p. 754 of vol. xxv. I wrote on the supposition that P. gentianoides was the reputed parent of the garden varieties. It is merely a suggestion on my part that other species may have become intermingled with them. I have before me Mr. Fitch's double-page plate of P. gentianoides in *Bot. Mag.* (t. 3661), and that of a very much poorer form of the same species in *Bot. Rec.*, t. 3, 1838. Dr. Lindley and Sir W. J. Hooker were both agreed as to the name P. gentianoides. The *Bot. Mag.* specimen flowered

in the Glasgow Botanic Garden; Lindley's specimen was procured from Mr. Groom, of Walworth. I have not paid any personal attention to hybridising species or varieties of Pentstemons, nor does "Soixante" seem to be any better informed. I find P. Hartwegii was introduced in 1835 and P. gentianoides in 1836. The last-named cannot, therefore, be Lindley's plant. One cannot do everything; but I have often wished I had time to spare for crossing some of the distinct species and varieties of this genus. Some of them are very lovely, and continue in flower after many things are destroyed by the autumn frosts. *F. Doull.*

PRUNING.

No better time than the present could be chosen for general forest pruning, for correcting linal leaders on standard trees, removing overgrown branches from the rides, and cutting back overhanging boughs from rides and drives. This latter should receive particular attention and be regularly attended to at stated intervals, as few things are more unpleasant to foot or other passengers than branches protruding into the walks and drives, and probably surcharged with rain. Where it is not considered advisable to remove branches altogether from trees and shrubs, terminal pruning, picking or disbudbing may be resorted to with favourable results. Prune closely off with a saw all broken and twisted dead or dying twigs and branches, and look over the lawn trees to see that none have died out, and if so, have such removed at once either by stubbing or felling in the usual way.

Pruning in the nursery should likewise receive attention just now, all contending shoots and ungainly side branches being removed or cut into shape. By so doing a great amount of trouble is saved hereafter, but unfortunately this is an operation that is too often neglected even in the majority of nurseries.

CUTTING WEEDS.

Thistles, Nettles, Dock, and any other rank weeds should be cut from amongst young trees, while plantation margins and waste ground will be all the better for an overhaul, as by cutting over the weeds before seeding time their future development is retarded in a considerable degree. Farmers too often perhaps give attention to by no means complimentary language regarding the seeding of woodland woods on their fields, but in nine cases out of ten, at least in this district, the fault is their own, for unencultivated field corners, head-rigs, and stackyards—not to speak of the parks and cultivated grounds—are anything but creditable to a Welsh farmer; but we may be born in a stable and yet not be a horse—so it might have been more truthful, at least conveyed a more truthful meaning, had we substituted "a farmer in Wales" for a "Welsh farmer."

Where Grass bounds in recently formed woods a sharp look-out will require to be kept, as it is apt to encroach too much on the young plants and be rather a nuisance than an advantage.

NURSERY WORK.

Weeds are, owing to the dripping season here, unusually abundant, and every opportunity should be taken advantage of to get rid of as large a number as possible. If being during dry sunny weather is undoubtedly the speediest and best method of getting rid of them; but where this cannot be engaged in from thickness of the plants in the bed or other reasons, hand-weeding is a good but rather expensive substitute.

Seed beds will, during dry weather, require attention in the way of watering—work that is best performed in the cool of the evening, or the last thing before the men leave off work at night. Weeding of seed beds may be done during damp weather, as there is then less chance of the young plants getting loosened or otherwise injured when extracting the weeds. Young hardwoods and Pines may now be looked over and pruned into shape, by the cutting away of all rampant side shoots and contending leaders. The ties and clay around grafts must receive attention, the former by being loosened where the

scion has taken, and the latter by being kept moist and free from cracks.

The pink Hawthorn and Horse Chestnut may now be budded upon the last year's shoots, taking care to bud upon stock that are somewhat in advance of those from which the buds are taken. This is a simple and at the same time inexpensive way of introducing contrast and beauty to our woodland glades and margins.

All vegetable refuse in the nursery should be collected in a heap or heaps, and turned over occasionally, so that fermentation may go on equally over the masses. In the case of weeds this is particularly desirable, so that their germinative properties may be completely destroyed, and to hasten and insure this the admixture of a small quantity of lime is to be highly recommended.

Seedling Rhododendrons may still be planted in lines, care being taken to lift the plants with good balls, keep quite damp until planted, and afterwards shade by means of Spruce branches for a few days until a start to growth is made.

Wind-swayed Pines and Firs in the nursery breaks should be tramped up at once, and in doing so rather incline the tree's head to that from the point where the prevailing winds of the district blow.

Do not use stones into the holes formed by the trees while rocking about, for this is a highly injurious practice, and one that, unfortunately, is by far too often performed, but stamp the surrounding soil firmly into all crevices, and level the surface with a spade. If left unnoticed, wind-swayed plants soon become unhealthy, and assume a yellow, withered appearance previous to dying outright, this being caused by ingress of air at the roots, as well as by the straining and mangling to which such are subjected. *A. D. Webster, Penrhyn Castle, North Wales.*

The Rockery.

THE season has been very suitable for all the various kinds of plants growing in this department. The heavy rains in the early part of the summer greatly assisted them in making good growth. The drought, at present, is rather telling on the Ferns, especially *Onoclea sensibilis*, *Struthiopteris germanica*, and *Adiantum pedatum*, giving them a browned appearance; all other varieties withstand the dry weather very well. The rockery is now in its full beauty, the large clumps of *Spirea japonica* are one mass of their white flowers, the little wild Thyme and Myrtle cloth the rocks, and the various varieties of *Sedums* and *Echeverias*, are all in full bloom, also *Erica scoparia stricta*, *Palafox grandiflora* and *P. setacea var. purpurea*, *Ononis arvensis*, and the small white Campanula, and rock Pinks, all tending to enhance the beauty and variety of this, in my opinion, one of the most interesting branches of horticulture, as there is always something to attract the attention, even in the depth of winter. *Veronica rupestris formosa*, of which I have large clumps interspersed amongst the rockwork, are literally covered with their tiny blue flowers. The *Helianthemum*s are just out of bloom, but the *Lysimachias* are at present supplying quantities of their yellow flowers. *Gaultheria Shallon* and *G. procumbens* are also in full bloom: these are very suitable subjects associated with rockwork. With us *G. Shallon* grows on the sandstone rock without any soil, and sets its fruit freely. *Rhododendrons*, self-sown, grow in the same way. The named varieties of *Pycnethams* and *Lychins* are very suitable for this garden, and are most useful to cut for decoration. I now give the names of a few Conifers that have been planted here many years, and which seem most suitable on the rockery:—*Taxus adpressa*, *Picea excelsa compacta*, *c. clausbrasiliana*, and *Irish Yews*; these all occupy the high places in the rockery. *Picea excelsa pumila*, *c. pygmaea*, *c. parvifolia*, *Abies e. Hudsoni*, and *Juniperus prostrata*, are distributed about in the intermediate and lower places, and are all very suitable to this purpose. I find it a good plan to overhaul the rockwork about every fourth year, taking up all the small plants, dividing them where necessary, turning out the old soil, and putting in fresh material—a mixture of loam and leaf-soil and peat—where required. I generally do this in September and October, so that the plants get settled again before winter really sets in. *Edward Ward, Howell Gardens, Bromsgrove.*

The Flower Garden.

WATERING THE BEDS.

WATERING of plants will call for a large amount of attention during hot weather. This is work that is best delayed as long as possible in the daytime—the later the better; and should a cloudy day arrive advantage should be taken of it. Positive injury is done by dribbling water over the beds, for no sooner does the sun shine than it is again rapidly evaporated. If all the beds cannot be watered at once the better plan is to give one or two beds a thorough drenching in the evening, and next morning, the first thing, to give these beds a careful stirring with a hoe or rake. The fine soil being thereby mixed with a large portion of air makes a capital non-conductor, and moisture will remain in the soil for the benefit of the plants. If we could but produce an atmosphere corresponding to that which is present during a fall of rain, how easy would our task become! Shading is a method which could be resorted to when there are only a few beds, but where there are many of them it is out of the question, and there is nothing for it but artificial watering.

BEDDING PLANTS

should have well filled the spaces allotted to them, but this is far from being actually the case. Many of them have made but little progress in growth, the late very hot weather disposing them to flowering—a disadvantage when the display is not required till the middle or end of August. Most of the flower-heads might be removed, and the plants would then be disposed to make growth. Now is a suitable time for making notes on, and correcting errors in, the arrangement of the beds. Carnations will require abundance of water to keep them in good health. If shading in some shape can be placed over the beds so as to shade them when they are coming into bloom, the flowers will be much finer, and their season of blooming will be much prolonged.

LAWNS.

These had begun to feel the effects of the drought, but the late rains will have improved their appearance. The roasting out of Dandelions, Plantains, and other weeds, should be proceeded with whenever opportunity offers. If the centre be cut out, and a teaspoonful of salt placed on the orifice, they will give little further trouble. *W. M. Baillie Luten Ho.*

PLANTS AND THEIR CULTURE.

THE GREENHOUSE.

THOSE who are fond of variegated or fine-foliage plants will find the variegated Yucca a most suitable class, including *Y. variegata*, *Y. quadricolor*, *Y. Stokesii*, and many others. These plants are best potted in rich loam with plenty of sand. *Aralia Sieboldii* variegata, *A. argentea* var., *A. urea* var., are useful plants, with ample foliage, distinct in habit, that will stand a great deal of rough usage. The New Zealand Flax, *Agapanthus umbellatus* variegatus, *Hydrangea argentea* variegatus, *H. aurea* variegatus, are both handsome and useful. The *Aspidistra lurida* and the variegated variety are always beautiful. The different sorts of *Abutilon Darwinii*, *A. tessellatum*, *A. Thompsonii*, and *A. Sellowianum* marmoratum, are very useful. *Myrtus communis* variegatus is another which is very telling in decoration work, and for cutting. All the above-mentioned plants are easily grown and may be placed for a great part of the year in structures where flowering plants of free growth would suffer.

PLANT PITS

must now be well looked after. To keep the plants in them in good order, turning them round to get them nicely balanced is very essential. *Poinsettias*, *Euphorbia Jacquinifolia*, *Aphelandras*, *Justicias*, and *Gardenias* of sorts, *Lobelia panhensis*, *Impatiens Sultanii*, and others, *Bromeliads*, *Cyclasas* and *Balsams*, which have filled their pots with roots, will be benefited by having a regular supply of manure-water. *Gloxinias* and *Achimenes* must be kept well shaded

when opening their bloom, otherwise they last but a short time and their flowers will not be nearly so bright.

PROPAGATION

should be pushed on now as fast as possible with all the double *Primulas*, as these are the most useful of plants for the autumn and winter months. Any *Draecenas* which it is desired to increase may be propagated by taking off the tops of the plants, which will root freely at this time of year if placed in jars of water in a moist stove, potting them off as soon as a good quantity of roots have been formed. Shift on all plants of *Solanums*, such as *Williams' Little Gem* and *S. Princess of Wales*; these make charming little plants during the dull months. Keep the syringe at work freely in the plant pits during hot weather, especially where cement or impervious stone is used for the walls. Keep *Gardenias*, *Isorais*, and *Taberernaemontanas*, which have recently been cut down, quite close and in a moist atmosphere until they break freely. *A. Evans, Lythe Hill, Hastedere.*

FRUITS UNDER GLASS.

MELONS.

So far, the weather this season has been most favourable to the production of Melons of first-rate quality, and during its continuance fire-heat may be dispensed with. But in the event of a change to dull weather ensuing, the water in the pipes should be sufficiently heated to raise the day temperature to 75°, and to prevent that of the night from falling below 70° or 65°. Especially is it advisable that this should be done during dull weather in houses in which the plants are either in flower or their fruits are approaching maturity, because, in consequence of a more buoyant atmosphere than could otherwise be maintained being commanded, a quicker and better "set," as well as more highly flavoured fruit, are secured. However, when the character of the weather is such as to render fire-heat unnecessary, the amount of atmospheric moisture in the houses in the afternoon should be somewhat reduced in quantity. Melons swelling their fruits should, prior to being watered, have a dressing of manure laid on the surface of the bed, keeping it an inch or two away from the stems of the plants, which will, with proper treatment, bring about the best possible results.

PITS AND FRAMES.

Late plantings in pits and frames will now be coming into flower. For this reason, with a view to securing a good set, the sashes should be drawn off for a few hours—say from 11 A.M. to 2 P.M.—on sunny days, and the blossoms fertilised when the pollen is dry, until the desired number to form the crop be obtained. Three or four fruits—according to the condition as regards strength of the individual plants and the size to which the varieties grown attain to—will be an ample crop for each plant to ripen. Remove all superfluous fruits as soon as it can be seen which are going to swell, and those left for the crop should, as a matter of course, be the most even as regards size, and be distributed as regularly as possible over the bines, and after they have attained to the size of a full-grown *Magnon Bonum Plum*, be elevated above the foliage on inverted flower-pots. The thinning and stopping of the shoots should be attended to, two or three times a week, and not be left, as is not unfrequently the case, until barrow-loads of shoots are removed at one time, to the detriment of the crop. At the beginning of next week a sufficient number of seeds of those two excellent varieties *Bienheim Orange* of Hero of Lockinge should be sown, to furnish plants for supplying Melons in November and December.

VINERIES.

The semi-tropical weather which we have experienced during the last three or four weeks having rendered fire-heat unnecessary in vinerias at night, therefore a diminution should be made in the distribution of atmospheric moisture in houses in which the Vines are swelling their crops, otherwise mildew will be likely to put in an appearance, though there need be no apprehension felt in this direction in the case of Vines from which the crop has been taken, and among the leaves of which there is a free circulation of air day and night. These should be thoroughly

syringed every afternoon with clear water, and like Vines in every stage of growth, should be kept well supplied with water at the roots.

GRAPES AND SPIDERS.

House spiders are quite as troublesome to Grape-growers as they are to housemaids, and they are certainly much more injurious if allowed to locate themselves in the vinerias, as afflicting the appearance of it, may be, otherwise faultless bunches, by partially enveloping the berries in their webs to the detriment of the bloom, than their presence, however objectionable, would be in the interior of the town and country mansion. Therefore, at no time, and particularly during the summer months, should spiders be tolerated in vinerias; they should be hunted daily, and their webs broken up, great care being required in removing these with a camel-hair pencil from the bunches of Grapes, or berries, not to rub the latter, as in that case the work would be better left alone; the spiders may be removed from the interior of the bunches by the aid and careful use of a pointed stick and a pair of Grape scissors. *H. W. Ward, Longford Castle.*

The Kitchen Garden.

SEEDS TO SOW.

Turnips.—During this month, and up to the second week in August, these should be sown largely, as upon these sowings will depend the supply for winter and spring consumption; moderately firm, light, rich soil suits them best, and the surface before sowing should be rendered fine and workable by forking, raking, &c.; afterwards sow in shallow drills 1 foot apart for the small varieties, and from 15 to 18 inches for the larger growing ones; among the latter *Veitch's Red Globe* and *Green-top White Stone* are about the best for the purpose. Thinning out the young plants should be done as early as possible, and before they become in any way overcrowded and weakly. Sow also, about the middle of the month, for a good supply, some fine early Cabbage, such as *Ellam's Early*, or *Wheeler's Imperial*, for early spring use, and a fortnight later a more general one, a portion of which will be available for planting out in October and November, and which will also constitute the main supply for the following spring and summer.

Cucumbers.—A small sowing of *White Lisbon* now, in drills 1 foot apart, in a dry sheltered position; but the main autumn sowing of *Giant Rocca*, &c., had better be deferred until the middle of August. An additional sowing of *Early Horn* Cucumber, if desired, may still be made on a warm border.

Lettuces.—Sow Cabbage varieties now in beds in warmer situations, also *Brown-seeded*, *Bath*, and *White Cos*, for coming into use in late autumn and winter; likewise *Batavian* and green *curd* *Emmie*, *Kalisher*, *Mustard* and *Cress*, and other requirements for salads.

Leeks.—Whete extra fine specimens of these are required, trenches should be prepared for them very similar to those used for planting Celery, that is 1 foot wide, and when ready for planting 9 inches deep; the soil at the bottom of the trench, after being thoroughly loosened and broken up, should be enriched by the addition of some well decomposed manure, and the plants placed 9 inches apart in the rows. During the growing season occasional applications of artificial manure will be highly beneficial; earthing-up should be deferred as long as practicable. Planting on the level, for all ordinary purposes is the best and most profitable method. A plot of ground that has been manured for a previous crop will be the best; holes should be made with a dibber in lines 1 foot apart and 9 inches deep, and the plants dropped into them, soil sufficient to cover the roots only being placed in the holes at the time of planting. Good strong plants will be necessary for planting in this manner, and the holes should be widened at the ground level, and the soil made firm by twisting the dibber a few times round on the inside.

GENERAL WORK.

Plant out late Broccoli, autumn Cauliflower, Kale, &c., and fill up any spare corners and vacancies with Savoy, Cabbage, Coleworts, &c., and attend to the earthing-up, mulching, and watering of growing crops, staking of late Peas, &c. Clear the ground of early Potatoes, in readiness for succession crops, and if not quite ripe the tubers should be allowed to remain on the ground for a few hours, to set the skin, and afterwards removed to a cool shed, and lightly covered over. Cauliflowers should be looked through daily, and as soon as the heads show the leaves broken down over them, to keep them white and tender. Where it is necessary and needful to retard some for a few days, they should be cut off close to the ground, or pulled up by the roots, and placed in water in a cool cellar or shed, *John Austin, Wiley Court.*

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, July 14	{ Sale of Imported Orchids, Palm Seeds, &c., at Protheroe & Morris' Rooms { Bedford Agricultural Society's Show at Hitchin
WEDNESDAY, July 21	{ Newcastle-on-Tyne Horticultural Society's Summer Show (three days) { Sale of a Collection of Established Orchids, Clivia Plants, &c. at Stevens' Rooms Clearance Sale of the Collection of Stone and Greenhouse Plants at Furze Down Park, Tooting, by Protheroe & Morris { Grantham Horticultural Society's Summer Show
THURSDAY, July 22	{ Waterhouse and District Rose Show Sale of Imported Orchids from Mr. F. Sander, at Stevens' Rooms
FRIDAY, July 23	{ Sale of Imported Orchids, at Protheroe & Morris' Rooms

UP to the present time we have heard comparatively little of the POTATO DISEASE this year, but the weather of the last week has been favourable to the growth of the fungus, and we may confidently expect to hear shortly of its appearance in various localities. Probably we shall hear less of it than in some preceding years, for the excellent reason that, for the last year or two, the climatal conditions have not been favourable to its development, and that now, when, as it would seem, these conditions are more favourable, there is less fungus to develop, and that, in consequence, we shall have fewer lamentations. This is only saying in other words that the Potato disease is, to a large extent, an affair of weather, and this is true. Unfortunately it is also true that a large number of persons—the vast majority, indeed—influenced by this fact, are content to sit with their hands before them and do nothing. "We cannot," say they, "alter the weather, and therefore we must put up with the loss." Is this a fair—is it a reasonable inference? We do not think it is. True, we cannot alter the weather. We cannot alter the course of the seasons, but the seasons themselves tell us—if we would but read the lesson aright—that the pest is controllable, and that it is our own fault if we allow it to go unchecked. All the time so-called "practical men," who really are the wildest of theorists, go on talking about things they do not understand—electricity, degeneration of the Potato plant, and the like—so long may we expect their lucubrations to be barren of results.

The truth is, the investigation of the nature and course of the Potato disease is, in all essential points, beyond the powers of untrained observers, and is only to be profitably undertaken by specialists. A man unaccustomed to the use of the microscope, one who is not familiarly acquainted with the nature and mode of growth of fungi in general, and of those in particular which affect the Potato (for there are many), is, for all he may think to the contrary, a visionary theorist. He may pride himself on being a practical man—and on certain points of practice he may be all that his own fancy or the verdict of his neighbours paints him to be—but even from his own standpoint he must be adjudged a failure, if he neglects those practical means which science has laid before him of combating the disease. He either deliberately ignores them, or he has formed the opinion that it is better worth his while to let things go than to adopt such measures as are clearly open to him. This may be so. Abstract science is one thing, fiscal regulations, rent and taxes, the price of labour, foreign competition, form another and very complex whole. It may be that the grower is right when things are looked at from this point of view, but he can only be right for the immediate present. It may be better to let things go for the moment; it must be better to stamp out the Potato disease in the future! Can it be done? Not absolutely, we fear; but that it can be done to a useful extent is, as we think, taught us by the lessons of the weather. The weather has held it in check for the last year or two, doubtless far more efficiently than we could

do, but nevertheless it has shown us that we can be checked. In the meantime what have we done? Have we put our shoulders to the wheel? Have we done a single thing on our parts to follow up the lead Nature has given us? During these years of relative exemption has any one man destroyed a diseased Potato when he has seen it? Not a bit of it. We take little or no heed whether we plant healthy or diseased seed-tubers. When disease of the haulm makes its appearance, we leave it to rot in the garden or the field; so that the fungus may disperse itself to the fullest possible extent; we throw the diseased haulms on the dung-heap, we use it as packing for Potatos that come to market; we give the diseased tubers to cattle and to pigs, and we scatter the manure broadcast. If we wished to do it, could we possibly ensure any better means of securing the diffusion of the Potato disease than those which we adopt? We have allowed ourselves to become fatalists, to act as though half a loaf were not better than none.

The Potato disease is due to the attacks of a parasitic fungus which passes a large proportion of its life within the substance of the plant, where we cannot get at it with any application that would not also kill the plant. Under favourable conditions the fungus comes to the surface, and gives off millions upon millions of spores wafted readily by the slightest breeze, and ready to sprout upon the leaf or haulm when there is sufficient moisture. With such an enemy—endowed with the faculty of propagation by various other means which we need not here detail—is there any reasonable chance that we could by any possibility control its diffusion? The answer to this question is surely given in the narration we have above given as to what we do *not* do. Over and over again we have seen—we have seen them on the day we are writing—one or two diseased haulms in a cottage garden or slip, the rest perfectly healthy; but the diseased haulm is left, and that one is more than sufficient to infect the whole neighbourhood, and if weather be favourable to it, it will do so. That one should be destroyed by fire the instant it is recognised, and its successors should be treated in the same way. We shall be told of course that the plan is not practicable on a large scale; nor is it, but is that any reason why it should not be adopted on a small scale?

We are confident that many a small crop on a labourer's plot—many a crop on which the amateur depends for the supply of his own household—might be saved by the destruction of diseased haulm the instant it is seen. In field culture this destruction of isolated plants could not, it is true, be carried out, but at least the haulms might be destroyed *ex masse*, if not by fire, which is difficult, by vitriol, by soaking in sulphate of copper or potassium sulphide, or other chemical, by avoiding throwing diseased haulm or tubers on the muck heap, and by never in any case giving tubers known to be diseased to the pigs.

— PHYTEUMA COMOSUM. — Our illustration (fig. 19), taken from a drawing of Mr. SENDTNER's, shows how this singular and beautiful plant grows "*chez soi*." A rocky cleft to root in, with plenty of soil therein, limestone *débris* by preference, copious moisture, as there is pretty sure to be in such a situation, and full exposure to the sun—these appear to be the requisites. The plant is allied to the Campanulas and Lobelias, and has deep blue flowers borne in close heads, with oblong deeply-toothed leaves. The flowers themselves consist of five petals, united into a tube at the tips, but balloon-shaped below, where the five petals are separate one from another, so as to leave interspaces between, through which presumably insects enter the flower, and carrying off the pollen from the included stamens would deposit it on the projecting stigma of some other

flower. The plant is a native of the Austrian Alps, and was introduced into cultivation by Mr. GEORGE MAW.

— NOMENCLATURE.—At the Floral Committee on Tuesday the new rule was acted on in one or two instances; just the committee refused to recognise the name *Odontoglossum macranthum* Southgate, and certificated the plant as *G. macranthum*, Southgate's variety. This was done because no authority was cited for the name Southgate, beyond the exhibitor's fancy. The name has not been published, and no description or illustration has been given, as would be implied by the employment of a Latin name; and a Latin name without description or illustration goes for nothing. The adoption of an English name at once shows the true nature of the plant, and avoids confusion by preventing the possibility of confusing it with a botanically recognised plant. Of course there is nothing to prevent Mr. SOUTHGATE calling his plant Southgate, if he so pleases, but the Royal Horticultural Society should not recognise the name except under the circumstances we have mentioned. No hardship is inflicted on any one by such a course, and something is done towards simplification of nomenclature and the avoidance of confusion.—It having been ascertained that the *Doronicum* certificated at the recent meeting of the Royal Horticultural Society as *D. draytonense* had been previously described and figured (*Gard. Chron.*, vol. xx., p. 295) as *D. plantagineum* var. *excelsum*, the name *draytonense* was, on the proposition of Dr. MASTERS, expunged from the record, and the correct name inserted in its place.

— EREMOSTACHYS. — Dr. REGEL has lately published a monograph of the species of this genus, thirty-nine in number. These species are herbaceous perennial Labiates, many of them of an ornamental character. The monograph is of a purely botanical character, and is illustrated with several outline illustrations.

— "ENGLISH BOTANY."—With the eighty-ninth number the new edition of *English Botany*, edited by Dr. BOSWELL, is brought to a close. The present part is almost entirely taken up with the index, which is very copious. A preface informs us that, owing to the ill-health of Mr. BOSWELL, the completion of the work was entrusted to Mr. N. E. BROWN. All concerned may be congratulated on the termination of a work of such magnitude and sustained excellence.

— FRENCH NURSERYMEN AND SEEDSMEN.—We learn from the *Revue de l'Horticulture Belge* that a society has been established in France to protect and develop the interests of the horticultural trade. The discussion of fiscal regulations and legislative reforms, so far as they concern horticulture, is one of the objects of the society, as well as the establishment of a central committee to afford information calculated to prevent the losses in the horticultural trade.

— FLOWERING OF AGAVE FILIFERA. — An object of popular as well as scientific interest has suddenly and unexpectedly appeared in the grounds of the Edinburgh Exhibition this week, in the shape of a very fine specimen of this plant throwing up an enormous flower-stem. The plant forms one of the collection of Messrs. IRELAND & THOMSON. The stem was first observed on Monday last, when it was only just issuing from the crown of leaves, and was the apical growth, that in three days it has attained a height of 23 feet. The stem at the base is about 3 inches in diameter, and is densely clothed with long acutely lanceolate fringed scales of a grey-green colour. It is now protected from injury by a wire guard, and we may hope to see it develop its inflorescence to perfection.

— HOLLIES.—Some beautiful examples of these were noticed at the Royal Horticultural Society's Show at Liverpool, the production of the Elvaston Nurseries of Messrs. BARRON & SONS. Evidently the soil of this nursery suits them admirably, the colouring of the different kinds being clear and well defined. Of kinds we noted *nobilis*, a fine broad-leaved kind; a pendulous variety of *argentea*, very pretty; *ovata*, *aurea*, *variegata*, *medica picta*, *laureifolia*, and *Gold and Silver Queen*.

FIG. 19.—PHYTEUMA COMOSUM AT HOME : FLOWERS LIGHT PURPLE. (SEE P. 80.)

— **DOUBLE FLOWERS AND VARIEGATED LEAVES.**—Some years since the late Professor MOORE advanced the notion that double flowers did not co-exist with variegated foliage. Many exceptions were, however, soon pointed out, and some were shown on Tuesday last at the Royal Horticultural Society, in the shape of silver leaved Pelargoniums with double flowers.

— **MR. RIVEY'S POT FRUIT TREES AT LIVERPOOL.**—It appears that, although we made mention of the beauty and vigour of Mr. RIVEY'S pot trees at Liverpool, we omitted to mention that a Gold Medal was awarded them. In repairing the omission, we may say that the trees amply deserved the recognition they received.

— **INHERITANCE, OR OTHERWISE, OF COLOUR.**—We hear of people ready, from peculiarities of appreciation, to say black is white, and *vice versa*, and some sort of oblique maintenance is given to such a proceeding by the fact that black does not always reproduce black, nor white succeed to white. An instance of this was afforded the other day at Kensington, where a new white Grape was shown with oval berries, and stated to be a seedling from Black Monukka. No foliage was shown, nor was there a bunch of the parent with foliage for comparison, as there should have been.

— **CASSIA LIGNEA AND THE CHINAMEN.**—According to the report of the Superintendent of the Forestation Department of Hong Kong for 1885, there is a great difficulty in growing this tree, as the following extract from the report will show:—"The plantations of Cassia lignea that were made on the hills north of Aberdeen would probably have been in a thriving condition by this time but for the persistence of the Chinese in breaking off the leaves and branches of the plants. They appear to attach some importance to the plant as a medicine, and despite the vigilance of the forest guards, they succeed in keeping the plants in an almost leafless condition. Even in the Botanic Gardens, where the plants are protected by iron tree-guards and wire netting, they have killed several plants by persistently defoliating them and wrenching off the branches."

— **PULTENEA ROSEA.**—writes Baron FERDINAND VON MUELLER—is one of the most local of all plants in existence, being absolutely restricted to the summit of Mount William, in the Australian Gramplains, at about 5000 feet. This is also the exclusive native locality of *Eucalyptus alpinus*. If plants strong enough for experiment are available, they might be tried in mild places of England as outdoor plants, inasmuch as this *Pultenea* has to endure in its native haunts a sub-alpine climate, and is subjected to frosts of more or less severity through several months in the year. In places like Arran in Scotland, the Devonshire coast, and the Channel Islands, it ought to prove perfectly hardy.

— **MYLESIA.**—The last numbers of Signor BECCARI's publication relating to the flora of the Italian Archipelago contains the continuation of the lengthy catalogue of "piante epistatiche," or plants selected as habitations by ants, including not only the curious *Hymenophyllum* and other Rubiaceae, in which large gall-like swellings occur on the plants, and which become the residences of ants, but also of various Asclepiads, Duschida, Nepenthes, Ferns, Palms, &c. The third volume opens with a monograph of the species of *Nepenthes* of which thirty-three species are admitted, as well as eighteen hybrids. A list of the Ferns and Lycopods of Borneo and New Guinea follows, and the commencement of a paper on "Asiatic Palms" is given. Excellent lithographic illustrations of more or interesting species are given.

— **"LINDENIA."**—Among the plants figured in recent numbers are:—

Cypripedium lativerrucosum var. *Hyacinth*, t. 42.—A variety with the mottled leaves of *C. Lawrenceanum* or *C. Dayanum*, with the upper sepal white with green veins; petals narrow, ciliate, green; lip pouch-shaped, green.

Dendrobium striatum, t. 43.—A very curious *Dendrobium*, described by Professor Reichenbach in our columns, vol. xxv., p. 266. The flowers have white lanceolate sepals, the whitish lateral petals are much

longer, narrower, erect, and twisted; the lip with two lateral erect lobes and a spade-shaped flat central lobe, all white, with violet venation. The plant is a native of the Sonda Isles. The flowers are produced in great abundance.

Cattleya speciosissima var. *Malouana*.—A form with large flowers, sepals and petals magenta-coloured, lip trumpet-shaped, with an expanded two-lobed limb, rosy-lilac, mottled and streaked with reddish-purple, and with a white throat blotched with orange.

— **EXTRAORDINARY TITHES.**—A meeting of Hop and fruit growers from the counties of Kent, Sussex, and Surrey was held a few days since at the Bridge House Hotel, to consider the recent Act for the abolition of extraordinary tithes. Mr. T. H. BOLTON, late M.P. for North St. Pancras, who is President of the Anti-Extraordinary Tithe Association, occupied the chair, and explained the provisions of the Act which he had carried through the last Parliament, and suggested the course that would be probably adopted, settling the amount of compensation to be paid. He thought that it would be desirable that persons interested, both as landowners and tenants, should co-operate together to avoid unnecessary complications and difficulty in working out the Act, and to insure the fixing of a reasonable scale of compensation. A long discussion ensued upon the provisions of the Act, which was generally approved. It was resolved, pending the carrying out of the Act, that as far as the association could influence the individual action of Hop growers and others the distress sales should be suspended. A vote of thanks was given to Mr. BOLTON for his services to the Hop, fruit, and market gardeners in obtaining the Act.

— **STATICE SUWOROWI.**—Like many other things that hail from the same quarter of the world, this showy and highly desirable annual is bothered with a difficultly spellable and very unpronounceable name. It varies considerably, both as to size and showiness, under slightly different courses of treatment, but seems to have no difficulty attached to it if grown in a cool place. It is a native of Western Turkestan, and should accordingly, if the best possible results are to be attained, be grown in an unheated house or frame, even at the expense of treating it as a biennial, when it will form a strong crown with large, little divided leaves, and flower splendidly in early summer. A group of flowering specimens in the Cape-house at Kew, and another in the rocky exhibit much branched flowering stems, from 2 to 2½ feet in height. The divisions of the inflorescence are spicate, finger-like, tapering, often of considerable length, and densely furnished with rosy-pink flowers of medium size, having the calyx striped with a darker colour. A figure of the plant in REBEL'S *Gartenflora* gives a poor idea of the real beauty of this species; while another in the *Gardeners' Chronicle*, September 29, 1883, p. 393, gives a more favourable impression of the likely dimensions and showiness of the plant. Very different is the case with *S. leptostachya*, another annual species flowering in the herbaceous ground, with slenderly divided leaves, and slender spikes of inconspicuous, though pretty, pale-coloured, miniature flowers.

— **DRACONTIUM CARDERI.**—We are indebted to Mr. F. MOORE, the Curator of the Glasnevin Botanic Garden, for a specimen of the spathe and spadix of this handsome Aroid. D. Carderi is one of those Aroids which, from a tuberous stock, throw up a single leaf-stalk bearing a much-divided blade. The spathe before us is borne on an erect cylindrical stalk, purplish-brown, spotted with white, and with a few small prickles scattered over its surface. The spathe itself is about a foot long, concave-lanceolate acuminate, convolute near the base, bright velvety-green outside, dull purple within, but yellow near the base. The spadix is about 1½ inch long, cylindrical obtuse, dull purple, covered over the whole surface with purple flowers, having the whole conformation of the genus. The plant is a native of Colombia, and was figured in the *Botanical Magazine*, t. 6523.

— **GHEENT HORTICULTURAL SOCIETY.**—At a meeting held on the 5th inst. the following awards were made:—First-class Certificates: To Mr. Alex. Dalliére, for *Pernettya lilacina nigra* major, and *P. l. fructo albo*; to Mr. Aug. van Geert, for *Hoplophyton robustum variegatum*; to Mr. Desmet-Davivier, for *Anthurium Schizzerianum* var. *sanguineum*; to Messrs. Vervaeet & Co., for *Coccygne Massangana*; and to Mr. Linden, Director of the Compagnie Continentale d'Horticulture, for *Alcacia Augustiana*, *A. macmorata*, *Phrynium variegatum*, *Alcacia nigricans*, *Saxenii mammosula*, *Alcacia gigis*, and for *Amaryllis Bongeroti*. Cultural Certificates: To Mr. J. Hye-Leyssen, for *Cyrtopodium superbiens*. Commendations for Novelty: To Mr. Desmet-Davivier, for *Anthurium Schizzerianum* Brilliant; to Messrs. Vervaeet & Co., for *Odonoglossum Alexandræ* var. *fastuosum*; and to Mr. Linden, Director of the Compagnie Continentale d'Horticulture, for *Dracena Madame Lucien Linden*, *D. Comte de Grunne*, *Alcacia Macedonia*, *Pandanus Kerchovi*, and for *Dracena Mr. James Bray*. Commendations for Culture: To Mr. Alex. Dalliére, for *Todea superba*; to Mr. Linden, Director of the Compagnie Continentale d'Horticulture, for *Darlingtonia californica*.

— **FLOWERS IN SEASON.**—If Covent Garden and editors claying on their business adjacent thereto cannot, except at too rare intervals, visit the flower-gardens and shrubberies of our island, it is fitting that in this case the mountain should go to MAHOMET! On this principle Mr. BURBIDGE, the Curator of the Botanic Gardens, Trinity College, Dublin, obligingly sends us a boxful of flowers, which act as reminders to tell us what is in bloom, and to testify to the way things are grown in the Home-Rule counties. *Tropaeolum polyphyllum*, with its glaucous palmate foliage and wealth of yellow flowers. *Aster cadubicus*.—A tall species, with short-stalked, lanceolate leaves, slightly serrated, and hoary on the lower surfaces. The flower-heads are individually small (about half an inch across), but disposed in corymbs, the ray-florets pale lilac. *Chrysanthemum leucanthemum*, the Ox-eye Daisy, with the outer white florets not strap-shaped as usual, but tubular and irregularly lobed as in a *Centaurea*; as if to compensate for their irregularity, their size is much smaller than usual. This is a variety which will please the botanist, but lovers of *Marguerites* will not be so appreciative. Will Mr. BURBIDGE tell us if it is constant from seed? *Astrantia carniolica* is an improvement upon the common form, in having larger bracts tinted with rose. *Enflaurum fruticosum* is a half shrubby Umbellifer with thick, leathery, entire leaves, very unlike those of Umbellifers in general. The plant, we may add, does well in towns, and is striking even if not beautiful. *Anemones* in July are what we did not dream of some time ago, but in the Emerald Isle they seem to be able to make *Anemones* bloom for half the year. *Silene ciliata* is after the pattern of our common *S. inflata*, but has foliage more like that of a *Calcetaria*. *Danile Crinson Sweet William* may be recommended for general adoption as a border plant. *Centaurea glauca* is remarkable for its globular flower-heads the size of a Cherry, and consisting of overlapping silvery scales. *C. macrocephala* is the handsomest of its class, with large flower-heads as large as a mid-sized Apple or bigger, with curious brown jagged bracts, and a head of bright yellow flowers. *Lithyris tuberosa*, a species with wiry branches, obovate leaflets, and racemes of small lilac-rose flowers. *Achillea Millefolium* is a useful plant for lawns and banks. Sheep do not object to it, every one says how pretty it is, both in flower and foliage. The deep rosy variety may sometimes be found wild, and is well worth growing. *Acron argentea* is like our common Burnet, but has glaucous foliage.

From Mr. SMITH, of Newry, come the following notes with illustrative specimens:—*Abelia triflora*, now finely in bloom here. As a distinct free-growing, and free-flowering shrub it occupies a high position. *Calceolaria Stuebelii*, from New Zealand, is very distinct in shape from the better-known *C. violacea*, though the spotting and general appearance of the flower is much the same. Grown in a mass along with Musk and large-flowered *Minimus*, in a damp and half shady spot, it is very good. *Crocus Chathamia* is a most distinct rockwork shrub, mimicking as it does in flower-spike and foliage some of the large-leaved group, though its stems are quite prostrate.

THE ORCHID HOUSES.

CATLEYAS.

In all Orchid collections that are divided into three sections there is almost sure to be what is termed the Cattleya-house. But we find (as others no doubt do) that some Cattleyas do not grow well, flower freely, and keep in good health for many years if all are grown in the one Cattleya-house. Take, for instance, *C. speciosissima*: include all varieties of this grand Cattleya, and it will, I think, hold its own against any other species. We have had flowers as large as any Cattleya *gigas* I have ever heard of, and shades of colour that would please any Orchid fancier; and another point in its favour is that with proper treatment it will flower twice in the year. We grow this Cattleya at the south end and east side of an East Indian-house; they have but little shading, only running the blinds down when the sun is very powerful, and as they are all grouped together they can be managed without injuring the more tender plants in the house. *C. amethystoglossa* receives the same treatment. This plant I have seen standing in the Cattleya-house and not show the least sign of growing, while other species would finish up their growth and flower well. *C. Eldorado* is a very pleasing variety, and flowers at a time when most of the others are past. It is not a giant among Cattleyas, but it is very interesting. When several plants are grown it will be seen that the flowers vary much in their shades of colour, from the variety *crocata*, which I consider to be the best of the whites, and from the dark purple *ornata*. This species did not give satisfaction when grown with *C. Mossie* and *C. Trianae*, &c. On entering the Cattleya-house here, at the north end, close to the boilers, is about 12 feet divided from the main house, which forms a sort of lobby; this has brick sides and wall at the end. Over the slate stages at the sides (which have an opening at the back to let the warm air rise) is placed, about 6 inches above the other stage, and close back to the wall, a temporary stage of corrugated iron; this is covered with shingle, and a little live sphagnum is shaken over it, which soon grows, and formed a moist bed; here *C. Eldorado* grows and flowers well.

Cattleya Dowiana and its variety *aurea* are still among the grandest of Orchids, and one which the hybridist will not easily improve by crossing, as other colours do not blend well with the gold. I hope some day to see one with pure white sepals and petals. This Cattleya, if not well attended to, will, after five or six years from the time of being imported, begin to languish. If grown in the East Indian-house it should be in a light position under the top ventilator, so that the growths might make up with plenty of fibre in them, otherwise if grown in a close atmosphere and heavily shaded the plants will look green and healthy, and should the growths not rot off, the following spring will be a trying time for it, as it will probably turn yellow, and then it will take some coaxing to bring it round again. But take an imported plant of the same appearance and give it warm treatment and it will grow freely, while the former would make a very weak start. We grow this Cattleya at present in two ways, some are suspended in baskets over the *C. Eldorado*s, where the temperature at night is a few degrees higher when the fires are going, and there is more moisture in the air; and another lot is grown in pots on the stage at the warmest end and on the west side of a large division where a general collection of Cattleyas and *Leelias* are grown. Hence they get much of the afternoon sun, a rather light shading being used. The latter plants appear to be doing rather better than those hanging from the roof. Amongst them we find *C. Dowiana aurea* is the best grower. Now is a busy time for potting and top-dressing the various species, viz., *Cattleya Mossie*, *C. Mendelii*, *C. Skinneri*, *C. Lawrenceana*, and *Leelia purpurata*. Any plant that it is necessary to pot is attended to when the growth has started about half an inch, but some Cattleyas, such as *Mossie*, sometimes begin to root freely before the buds begin to break. These can be potted as soon as the flowers are over. Top-dressing can be done at any time, taking care not to disturb the roots more than can be avoided.

As the flowers of *Ojontoglossum vexillarium* fade and new growth commences the plants must be potted, and those in which the compost has become

Triteleia laxa, in a mass and grown as strong as the specimen I send, is often mistaken in the distance for *Agapanthus*; the latter frequently does not grow 2 feet high or bear forty flowers on a stem.

Deutzia candidissima, fl., is perhaps the best white-flowered shrub we have, and it would be hard indeed to imagine anything finer than it is just now. A mass of huge arching, 5 to 6 feet long, flower-laden branches, bending to the ground with the weight of their full double pure white blossoms.

Eucalonia leucantha is distinct and good on a wall; it is of moderate growth, and shows no tendency to outgrow the space allotted to it, as many of its near relatives do.

Philadelphus parviflorus.—This, though about the smallest of the group, is free in growth and free blooming, and is, moreover, the sweetest of all. Its delicious perfume approaches more nearly to that of *Boronia megastigma* than any other flower I know.

Bacchia aristata, as a cool greenhouse flowering shrub would not be easily surpassed. A specimen planted out here, and about 6 feet high, is now a dense mass of pendent flower-laden spray. It is in bloom nearly the year through.

Dianthus Acaulis.—This is a "come by chance" kind of seedling *D. barbatus*, and is probably a natural hybrid. However that may be it is a very charming perennial, bright, beautiful, and continuous blooming. [It looks like a cross between a Sweet William and a garden Pink. ED.]

— SCOTCH HORTICULTURAL ASSOCIATION.—

The ordinary monthly meeting was held on Tuesday, July 6, in the Society's rooms, 5, St. Andrew Square, Edinburgh.—Mr. ALEX. MILNE, President, in the chair. The President read a paper from Mr. DEAN, Ealing, on "The Primrose." After referring to the earlier history of the Primrose, he described the various varieties he cultivates himself. He was awarded a vote of thanks for the paper. The following were the exhibits.—Dr. PATERSON, Bridge of Allan, a collection of Orchids; Messrs. DICKSONS & CO., nurserymen, Edinburgh, a collection of single and double *Dolphins* and of *Crimm Moorlannum*. Mr. RUSHTON, Clatwood Garden, sport from *Pelargonium Beauty of Oxton*, which is identical with *Baltic*; Mr. McMILAN, Edge Hill, a variegated double white *Pelargonium*, which received a Certificate; also a bunch of *Chrysanthemum segetum*; Mr. MORRIS, Hay Lodge, a collection of hardy cut flowers; Messrs. MATHYEN & SON, nurserymen, Edinburgh, *Passiflora Constance Elliot*. The meeting closed with a vote of thanks to the exhibitors.

— CAMBRIDGE BOTANIC GARDEN.—

The most important operation, according to the annual report, has been that of planting the unique and remarkable specimen of *Aloe plicatilis* in a new tub, which, on account of the weight of the specimen and its exceptional liability to be injured, was one of considerable anxiety. It was, however, safely accomplished without the breakage of a leaf, or any disturbance of soil that was not intended. Extra good drainage was secured by means of drain-tiles, which were so arranged that the specimen may at any future time be lifted without difficulty by means of bars passed through them. The labelling of trees, shrubs, and other plants in the garden, has had a large share of attention. 7400 labels of all kinds have been used. 1120 labels, of a form noticed in the arboretum at Oxford, have been used for trees and shrubs, and it appears satisfactory; it has the upper part turned over so that the name is protected from falling dirt and drip without being in any degree hidden from view and is fixed in its place by means of copper wire. The use of zinc as a material for labels continues to be satisfactory, and several inquiries have been made about the system of making and writing that has been adopted. LaOuro provided by the special grant has been chiefly devoted to the continuation of thinning the belt of trees and laying down the ground with grass. In addition to this 400 yards of the path between the Panton Street gate and the Trumpington Road gate have been re-made. Among the principal plants of scientific interest that have flowered are: *Callisia insignis*; *Clematis Davidiana*, illustrated in the *Gardener's Chronicle*; *Crotalaria lamarifolia*, drawn for the *Botanical Magazine*, and not before known as a native of Africa, whence the seeds came; *Dioon edule*, of which the cone, a female, is preserved in the Museum; *Eucomis zambesiana*, n. sp.; *Iris*

Eulefeldii, drawn for the *Botanical Magazine*; *Iris kumaonensis*; *Iris Leichlinii*, *Iris Mislii*, *Iris reticulata* var. *sophemensis*; *Myosotidium nobile*, a plant of difficult culture and great rarity; *Opuntia cananichia*; and *Xanthoceras sorbifolia*, drawn for the *Botanical Magazine*. *Thladiantha dubia* was of interest in fruit, the female plant being rare. About 1319 plants and 1047 packets of seeds have been received. Contributions have been received from various Botanic Gardens, and a return has been made to most of them. Many interesting and rare plants have been received, among which may be mentioned *Amasonia punicea*, *Anemone Fannini*, a remarkable species from Souh Africa; *Dracunculus creticus*, *Drosera Barkeri*, *Galactedendron utile*, the Cow tree of South America; *Gymnogramma Pearcei*, several new species and varieties of *Iris* from Professor Foster, *Paulinia sorbilis*, the *Guarana*; and *Poincillas*, *Sisyrinchium filifolium*, the Pale Maiden of the Falkland Islands; *Streptocarpus*, n. sp., with red flowers; *Utricularia bifida*. In exchange about 763 plants and 1358 packets of seeds have been distributed. A number of plants have been very successfully forwarded to the Botanic Gardens, Georgetown, Demerara, and it may be interesting to state that *Neiumbum luteum* has become established there, having in a few months covered a large piece of water, producing thousands of leaves. *Vitis pterophora* has also made an immense growth.

— THYSANOTUS MILLIFLORUS.—

At a hasty glance this curious Liliaceous plant is rather misleading as to its real affinity on account of the absence of three out of six stamens. Other species also exhibit this peculiarity in a more or less perfect manner, and were for that reason grouped under *Thysanella*. The various other members of the genus are characterised by very unequal perianth segments, the outer being narrow and entire, while the three of the inner series are broad, overlapping those of the outer series, and finely fringed or fringed. This is well exemplified in the species under notice, the flowers of which are violet-purple, numerous produced in an umbel terminating a leafless scape, that rises sufficiently high to carry the flowers clear of the foliage. Like many other highly attractive flowers they are very ephemeral in their duration, in this instance expanding in the morning and closing up again early in the afternoon. A few only of an umbel expand at once, so that a succession is kept up for a considerable time by one umbel, and a good sized plant or rather group of plants, such as that flowering in the Cape house at Kew, is even more effective and more lasting. The leaves are radical, numerous produced, narrowly linear, and resemble one of an *Allium*, *Milla* or *Tulbaghia*, but have a semi-rigid or leathery character, another peculiar feature of a dry and arid climate, such as that of Australia, to which it belongs. Nineteen species are known, only one of which is found out of the above country.

— SENEIO SQUALIDUS.—

Every Oxford man must be familiar with, and well nigh every visitor to the famous University town must have been struck with the abundance and beauty of this plant on the old walls of the city. According to Mr. DRUCE's excellent flora, the first notice of the plant in its present situation was in the preface to SIBTHORP'S *Flora*, 1799, but how long before that, it had been established there is no evidence to show. PILLENIUS sent seeds of it to LINNÆUS, but whether from the garden or the college walls is not stated. Our present concern with it is as a decorative plant, and for the rockwork we know of no plant more effective over a long period than this curiously named plant. One caution we must however give, viz., that, wherever planted, let it be in dry poor soil. Under opposite conditions, it grows rankly, and loses half its beauty. We have used it with great effect in a flower bed, taking care that the bed was thoroughly drained, and that water was only sparingly given. Under such circumstances compactness of habit is ensured, and continuity of bloom during many months. Transplantation by means of seedling plants, is better than propagation by seed.

— PUBLICATION RECEIVED.—

How I Managed and Improved my Estate. Reprinted from the *St. James's Gazette*. (London: G. BELL & SONS, York Street, Covent Garden.)

— GARDENING APPOINTMENT.—

Mr. ANDREW ARMSTRONG, late Gardener to R. S. DUNBAR, Esq., Eagle Cliff, Greenhithe, has been engaged as Gardener to Mrs. CORBETT, Ember Court, Thames Ditton, Surrey.

sour must be shaken free of it, cutting away any dead roots; then half fill the pots with new crocks for drainage, and pot the plants in two parts peat and one of sphagnum, adding a few pieces of broken pot-herb. If the weather should be hot and dry it will help the plants much if extra shading be put on after potting, keeping the house damp, and also round about the pots and on the surface, but do not water the plants for a time. *C. Woolford, Downside.*

SUMMER PINCHING OF THE SHOOTS OF FRUIT TREES.

FOR the better elucidation of the directions as to the summer pruning of Pears and Plums given in our Notices to Correspondents, we give a figure (fig. 20) showing how summer shoots can be made to form fruit spurs without the wasteful method of wholesale cutting back of young shoots so often practised by gardeners.

The block is one which illustrated an article on this subject in the *Gardeners' Chronicle* for July 10, 1847. Since that time the art of making fruit trees fruitful after this manner has been successfully taught by the late Mr. T. Rivers, M. De Breuil, and others. Mr. Cappel says, in describing the method, he commenced to pinch the young shoots nearest the leader (this would apply to young trees in course of being formed, but is equally applicable to branches of old trees) as soon as they are from $2\frac{1}{2}$ to 4 inches long, as seen at *a, a*; then let all the other shoots go on until they have of a certain length, when he pinches them at *b, b*. This severe pinching will sometimes cause the shoots to die off, and to convert the existing spurs into shoots. In general, however, the young shoots after they have been pinched will remain stationary, with only one or two leaves on them, and, in the year following the operation, will form fruit spurs. Under certain circumstances, when the trees are of a very vigorous growth, they will break again, so that they will require to be pinched a second or third time, as will be observed at *c, c, f, f*, and *g*. When it was found that the tree had too much sap, Mr. Cappel allowed those branches that had been pinched a second or third time to remain untouched at the winter pruning, and he only cut them in after they had produced some shoots, by that means preventing some of the branches taking too great a development. The branches *b, b*, illustrate the case, and they will be cut off at *i, i*. The pinching of the shoots on a leader differs a little from that practised upon the lateral branches. Supposing fig. 20 to be a leader of a pyramid, instead of pinching the shoots *a, a*, as they are represented, he let them grow to the length of *b, b*, before he pinched them, this being necessary to secure wood for the next winter pruning.

HOME CORRESPONDENCE.

Rose coloured Wild Primrose, and Primrose craticulosis.—May I be permitted to revert to a note of mine which appeared in the *Gardeners' Chronicle* of the 5th ult., p. 649, regarding a plant of the above description, which I found growing wild near Fochabers? At the time I referred to it I considered it an unusual departure from the usual yellow colour of our uncultivated native Primrose, and I was under the impression that any departure from either its specific form or colour only occurred, and that rarely, in the Southern Counties of England. The editorial note appended to my inquiry for information, so far undecided me on this point, and I have now confirmatory evidence that the aberrant colouring in question is not the result, or, at least, the sole result, when occurring, of a comparatively warmer temperature. A lady friend, on seeing my plant in bloom, informed me that some years ago a forester or keeper brought her several Primroses of the same colour, which he had gathered in a still more northern district—on the estate of Skibo, Sutherlandshire. These she carefully preserved, and has cultivated ever since. She subsequently sent me one of the plants, which I found identical in all respects with the one I submitted to you. I am in hope of being able to raise ripen the seed of one or other of these, and to raise the plants therefrom, so as to ascertain if any or all of the produce will come true, and adhere to the abnormal colour, or revert to what is supposed to be the permanent colour of the species. On the whole, I suppose it may be held that the farther north we go the Primrose has a lessened tendency to diverge.

Apropos of my last remark, I am reminded that the recent National Primula Conference, and also the selection of late years of the Primrose as a political party emblem, will both be the means of bringing our sweet, modest, and favourite flower from its retiring and haunts into public favour, and a colorty only hitherto accorded to its more pretensions and well-to-do relatives, the cultivated and highly-prized show Auricula and Polyanthus. On that account I may be allowed to refer to a circumstance connected with its habit of growth which I have never been able to clear up. As our American cousins would say, I was "raised" in a dry sandy district where Primrose seedlings were unknown. On coming (nearly fifty years ago) to reside in another north country village, I was delighted by seeing this attractive flower growing abundantly along the banks of a neighbouring river. On becoming aware of my partiality for these "earliest nurslings of the spring," an intelligent villager told me he had introduced them into his garden and cultivated them for more than a quarter of a century for borders to the footpaths in same. On showing them to me, I observed that they differed from those growing by the river side, inasmuch as each flower of the latter was borne on a single flower-stalk or scape, while those of the first-mentioned kind were on pedicels of short or moderate length (as I afterwards became aware), like the other four or five recognised indigenous British species of the same genus, none of which grew in or near the district referred to. My friend, however, assured me that they had all under cultivation, and several years after their removal, assumed this form of inflorescence. His garden, I may remark, was favourably situated and sheltered, had rich and suitable alluvial soil, and he treated his plants generously with manure; all which might have been the exciting cause of the change. At the time I suggested that the plants he showed me might possibly have been self-sown from, and had gradually supplanted, those he had transplanted from the river side. He, however, was confident that they were the original plants, and had all, without exception, undergone the structural change referred to. Their umbelliferous uniformity did certainly support both his statement and theory, more than it did my supposition. In all my subsequent enquiries I never forgot, though I have never been able to verify, or, I may say, disprove the theory held by my old observant and long since deceased friend. I have cultivated and raised from seed all our aboriginal species (at present, from an unsuccessful attempt to hybridise *farinosa* and *scotica* with each other, I have obtained, and now in flower, vigorous and true seedlings of both the originals), but I have never found an undoubted form of vulgaris which had once assumed its recognised form of flower afterwards appropriate that of any of its congeners, or the reverse; and what one might consider the retrograde process take place with them. I am not overlooking the well known fugitive character of many of the Primulae, and that not only the garden forms and varieties, but that (excluding *farinosa* and *scotica*) our indigenous species merge into forms peculiar to each other when produced from seed, both under cultivation and when produced under their natural conditions. I am aware that of the several single flower-bearing flower-scapes of vulgaris are traced downward they are found to terminate and unite in the crown stock of the plant, and that their union there might be held to constitute, as it were, a sessile umbel. Such being the case, if we were to suppose the crown of the root or the part of union were stimulated by a high or changed mode of cultivation into elongation, it would practically become the peduncle, while the scapes thereby upheaved and borne on it would in like manner become the pedicels of an umbel. It is a conclusion, and no doubt somewhat in antagonism to this supposition, let me add that I had opportunities of traversing during eighteen summers the main island of the Shetland group, where by "peerie" rivulets, and in rock-sheltered nooks along its wind-swept coasts, *P. vulgaris* (the "Mayflower" of the Shetlanders) grows abundantly, and enlivens the silent and otherwise often flowerless scene they grace with their presence. On these occasions I never failed to keep a watchful eye, when passing, my favourites, but among these I never detected the least change or tendency to change, either in their form or colouring. The cool and moist climate, the (over the year) equable temperature, and the unstimulating soil, may account for the sameness and uniformity of form I met with. Opportunities for similar observations in the Channel Islands might have favoured opposite conclusions. Some of your better informed readers may remove my uncertainty, and enlighten me on the interesting if perplexing questions I have referred to. *J. G.*

Helianthemum rosarinifolium.—I think there is a slight mistake in the foliage of the above. *C. M. Owen* speaks of it as having "small white flowers," whereas the true *H. rosarinifolium* has bright yellow flowers, and has leaves clothed with white tomentum; and, besides, it is an upright, not

a spreading shrub. The one mentioned by *C. M. Owen* I have no doubt is *H. umbellatum*, which is a sub-prostrate shrub, with dark green leaves, and has small but very pretty white flowers, which are borne in umbels—hence the specific name. It has a very geographical range, being found in considerable quantity through Central and Southern France; while *H. rosarinifolium* is, I believe, confined to the sea coast—at least, I have always found it in such positions. Both the above may be seen in the York Nurseries, Illogate, York. *R. Fetter.*

Gladiolus Watsonioides, Baker (see p. 49).—You will find this fully described in the *Journal of the Linnean Society*, vol. xxi., p. 405, and it will appear shortly in the *Botanical Magazine*. It was discovered by Mr. Joseph Thomson, and introduced into cultivation by Mr. H. H. Johnston. It is quite distinct from the Cape *Gladiolus Watsonius* of Thunberg, for which the name adopted in my Catalogue ("Systema Iridacearum," *Journ. Linn. Soc.*, vol. xvi., p. 161) is *Homoglossum revolutum*. Like many other of the Cape bulbs this latter has received a great many different names. You will find no less than eight cited in my paper. The Cape plant has a convolute subulate leaf, like that of *Gladiolus tristis*. The climatic conditions are also somewhat different (too long, and a third or half an inch broad, and grows twice as tall as the Cape species, and it has longer spathe, a shorter perianth tube and a more unequal perianth limb. *J. R. Baker.*

Secreting Glands of *Oncidium Batemanianum*.—It is contrary to the usual rule for secreting-glands to be developed outside of the flowers, or in any way unconnected with fertilisation in Orchids, but instances occur which have evidently been selected as ally for some other purpose. The primary function of glands is generally considered to be that of excreting waste products, which may, of course, be utilised by Nature for a secondary purpose. The present instance, however, is one of those peculiar cases where it is difficult to assign a satisfactory reason for their occurrence and use. Outside of, and at the base of each bract, subtending the flowers, is a gland that exudes a good-sized drop of a clear but viscid or sticky liquid. This takes place soon after the expansion of the flower, and when it has attained its best—probably when the latter is ripe for fertilisation. Not only does it exhibit a considerable degree of viscosity, but it is possessed of a rich and sugary taste, quite unlike the watery and insipid taste of the nectar usually contained in the nectaries of those flowers furnished with such. This tall-growing species does not seem to enjoy a wide popularity, judging from the fact that there are few published figures of it, but one or two in the "Knowledge" and "Scientific American" regularly and annually in the cool season of the Orchid-house at Kew about this season. *J. F.*

Wollaston's Apospory.—In your issue of Dec. 19, 1885, there is a most interesting account of Mr. S. B. Wollaston's discovery of apospory in connection with *Plysiychem angulare* var. *pulcherrimum*, Padley found some twenty years previous in North Devon; I have now much pleasure in announcing the appearance of precisely the same phenomenon (viz., the production of true prothalli from the apices of the pinulets in stead of by the mediation of the spore) upon another and distinct form of *P. a.*, *pulcherrimum* which was found by Dr. Wills near Chard in Dorsetshire. Mr. Padley's find was observed at the time to bear some abnormal excrescences upon the pinulets, but they were assumed to be a minute kind of cresting. Wills' find, however, has apparently until now produced nothing of the kind, and I believe the phenomenon has been induced by the very close Todea treatment to which I have subjected the plants in my possession with precisely the object I have attained. The growth of new form is a very beautiful fruiting along the inferior edge of the pinna, but are too immature at present to permit me to do more than chronicle their existence. *C. T. Drury, Fernholme, Forest Gate.*

Cocoons found in an Acorn at Cannes.—At your request I have applied to my niece for further particulars respecting these curious seed-like bodies, and now give you her account of the matter, which I think you will say does credit to her powers of observation and description [I have already observed in your issue of the 17th ult.].—"Thank you for your letter about the cocoons: I will tell you all I know about them. I picked up, last January, three acorns free from the cup on a road through a deserted garden at Cannes, and brought them home intending to plant them. One was a very large one. When I got back to London, I noticed something rattle inside the shell, and on breaking it open some of the little cocoons fell out. I took the shell and found it covered with a fine nearly covered with these little seed-like bodies, which were easily shaken off, and left little white "pits" where they had been, and a network of the

FIG. 20.—SUMMER PINCHING IN THE PEACH. (SEE P. 84.)

inner skin of the acorn. I opened one of the cocoons and found a little white body in it, just as you did at Ely. They did not change in the least (as far as I could see), during the months I kept them before bringing them to you. Neither of the other acorns had any cocoons in them. All the cocoons were found in one acorn. They were embedded in the nut and covered it completely and spread round the acorn." *W. Marshall.*

Odontoglossum vexillarium.—When the plants are in flower they are kept in a cooler and drier house to prolong their beauty. In such a place they continue in perfection from four to six weeks. During that time they make no perceptible growth, but when the flowers decay they make fresh breaks, and are from that time kept growing for the remainder of the year. Mr. Douglas would have preferred the sentence he quoted without the word "nearly." Such would

not truthfully express our treatment, as they are not encouraged to grow when in bloom. *J. Ridout.*

Ripe Mistletoe Berries in July.—Your correspondent seems to think that Mistletoe berries in July are something wonderful, but if he had made use of his perceptive faculties he would have seen they were the produce of last year, which had escaped the ravages of birds, probably owing to their immature condition from a late and cool season. I see that several large bunches on some Apple trees in my kitchen garden are now full of berries. I enclose a spray on which are last year's berries, and this year's in course of formation. *F. G. Rogers, Southampton.*

Pinus Lambertiana.—I send you by post a small box containing male and female flowers of *Pinus Lambertiana*, Douglas, sent to me by Mr. Thomson from Kenfield Hall, near Canterbury. The flowering of *P. Lambertiana* in this country has been so rare an occurrence, so far as I am aware, that these flowers seem to me exceptionally interesting, and I cannot help saying what a boon it would be to those who study Conifers in their scientific aspect if you would have them figured in the *Gardeners' Chronicle*, especially as the flowers of other rare species have lately been figured there. Among the rarer species of Conifers that have recently coned at Kenfield are *Abies bracteata*, *A. Pindrow*, and *Pinus Coulteri* (*macrocarpa*). *A. H. K.* [We shall endeavour to comply with our correspondent's wishes, and with those of others at home and abroad who have written in the same strain, and shall be grateful for specimens. *ET.*]

Work on Colour.—If there is such a thing as the science of colour it must be in a very rudimentary or at all events a very chaotic condition. Not only is the general public at sea in the matter of colour description, but even professionals and those whom we should look upon as adepts in colour painting frequently signally fail to give anything like an exact representation of natural colours. This refers to the colours of foliage, fruit, and especially to that of flowers. It is surprising and to be regretted that a popular work on colour has not been attempted and committed to the patronage of the public. Such a work would indeed be a boon, as expressed by "B." at p. 53; but its real value to the public at large would be difficult to realise if care were taken to inculcate its principles and disseminate its teachings. The primary value would depend upon its being authoritative, and to be accepted as a standard work it should be both exhaustive, definite, and decisive. Why should not instruction in colours be disseminated just as we are instructed or educated in other matters by illustrated books and periodicals innumerable? A recognised and reliable authoritative work of this character would not only greatly assist the artist, professional or adept, but constitute a source of instruction and pleasurable recreation to thousands of amateurs who earned their bread by other means. Take, for instance, the word green, and fathom, if possible, its significance. To simply state that a plant has green leaves gives but a feeble conception of what they are really like, and the same expression as applied to flowers is even more vague. Green (colour) is in reality a class word, including an innumerable variety of shades and tints. Referring to some of the old figures in botanical works, it has been jocularly remarked that the evolution of colour in flowers is often so rapid, that the latter are with difficulty recognisable alongside of the coloured figures of their historic progenitors. How different their prehistoric ancestors must have been! *Darlingtonia californica* is an instance in point, where the figure in the *Botanical Magazine*, t. 5920, has little in common in the matter of colour with living specimens. The sepals are too deeply green, without exhibiting any of their pale purple markings, while the petals exhibit a contrast of yellow and brownish-red that is altogether unnatural and misleading to those who have not seen living specimens. Many of the older botanists paid little attention to colour, and even yet some of them regard it as of minor importance, and dried specimens, especially of the great Orchid family, often do not even afford a clue to the natural colours. For this very reason figures coloured true to Nature would be invaluable; but it often seems an open question whether the artist meant to improve Nature, or whether the latter completely eluded or baffled his skill. A figure of *Barkeria Lindleyana* in the *Botanical Magazine*, t. 6098, and another in *Paxton's Magazine of Botany*, xiii., p. 103, agree in most points of structure and with the living plant, but the colour in both instances is altogether discordant with Nature. The second of the two figures quoted exhibits an extraordinary mixture and association of colours. The exterior surface of some of the flowers is of a nearly uniform pale violet-blue or some such indescribable colour, while the same aspect of others is all red except the lower half of the labellum. The apex of the labellum is deep almost blood-red with a large glaring white blotch above the column. All these colours, doubtless

ment to represent different shading due to the position of the flowers, are too exaggerated and too violent in contrast to be by pleasant, to say nothing of natural. That colour varies accordingly as the light is transmitted or reflected, and also upon its intensity, is well exemplified in *Masdevallia Veitchii*, or even better in *Nardodes Medea*, figured in the *Botanical Magazine*, v. 5723, and reproduced in the *Flores de Soree*, 1771, in both of which the labellum is described as lurid purple. The labellum is elsewhere described as purple or amethyst-purple. A notable feature in the latter figure, although a reproduction from the original. The spathe is differently individual in colour (which there is great reason to believe they do), or else the colour is so peculiar that scarce two writers describe it alike. In *Regeis's Gartenflora*, 1854, p. 307, the colour is described as "brilliant rose-carmine," and in the *Gardener's Chronicle*, xxi., p. 185, the spathe is said to be pale rose or pink-coral, and again as a lustrous pink-coral colour, while another writer says a peculiar deep red. These are but a few of the many instances that might be selected to show the necessity of some reliable and standard work on the subject. *F. F.*

— Under the above heading, your correspondent "H." raises a question of some importance, and well worthy of consideration. If, as he advocates, some authoritative book were published, describing the different colours, and the shades varying between, what an admirable work for reference it would be. It is in the diversity of the shades that confusion arises, and opinions differ; and this difference of opinion leads to an uncertainty on the part of others. As for instance, among the many things for which we are indebted to the gardening Press, not the least important are the notices of new plants; but if the descriptions are at variance concerning colour, doubts are raised in the minds of those who are intending purchasers—who have not the opportunity of seeing for themselves, but rely solely upon what they read. Some have been misled by the so-called "blue Primula," yet, on examination, the "blue" proves to be one of the many existing shades hard to describe, being neither one thing nor the other, and which would probably be classed under purple. Surely then, a standard work from a reliable authority, would be the means of clarifying all this, and prove highly beneficial to all who consulted its pages. *H.* [Our correspondents must not overlook the personal question, Do any two people really see colour alike? Again, the colour-printing processes now in use often do not at all fairly represent the original drawing, and moreover generally fade after a short time. Ed.]

Reports of Societies.

ROYAL HORTICULTURAL: Tuesday, July 13.

THE evening was enlivened by a beautiful display of hardy herbaceous plants from our suburban nurserymen and others, among which *Roses*, *Gaillardias*, *Lilies*, *Delphiniums* figured largely, and good vegetables and fruit added to the attractions of the show. A few new plants of merit, some *Orchids*, and Australian productions made up the more miscellaneous items of a beautiful and interesting display.

Scientific Committee.

H. Pascoe, Esq., in the chair.—Present: Messrs. W. G. Smith, J. O'Brien, G. F. Wilson, A. Grote, G. Maw, and Dr. Masters.

RHODODENDRON PONTIUM VAR. MYRTIFOLIUM.

Mr. G. Maw doubted this being a true native of Gibraltar, as stated at the last meeting. At the same time Mr. Maw mentioned that *R. ponticum* was wild at Algiers, where it grew in company with *Balanium dulcitra*, both cases affording instances of isolation.

CISTUS LADANIFERUS.

Mr. Maw remarked that plants of this with blotched flowers grew in Spain in company with others in which no blotches were perceptible. He had also seen a few instances of blotched and unblotched flowers on the same plant.

DICHLIS LUTEA AND GRANDIFLORA.

Mr. Maw suggested that these might be dimorphic forms of one and the same species.

DAMPFOLDS.

Mr. Maw reported on the occasional occurrence of erect-flowered *Baldouins*. He also stated that *N. minimum* of *Botanical Magazine*, t. 6, was identical with *N. minor*, and abundant in Central Spain at high elevations. Drawings of various hybrids were

shown, and the opinion expressed that *N. calathinus* and *N. triandrus* were one and the same species.

MASDEVALLIA DAYANA.

Mr. O'Brien alluded to this interesting species, in which the three sepals cohere by their tips, leaving, however, lateral apertures through which insects may enter, as in *M. fenestrata*. The peduncles originate from the top of the shoot, and not from the base as in other forms of the genus. A Botanical Certificate was awarded to the plant.

CATILEVA LODDIGESII.

A dimorphic flower was shown, on which Dr. Masters undertook to report at the next meeting.

FUNGUS ON MANGOS.

Mr. W. G. Smith alluded to a fungus *Cappadonium mangiferum*, which he had received from G. S. Jennan, Esq., of Demerara. The fungus occurs also in India, but there attacks the leaves only. In Guiana it bursts through the bark of the trees.

MISTLETO IN JULY.

Dr. Masters showed a spray of Mistleto with ripe berries.

SELENIPEDIUM AND UROREDIUM.

Dr. Masters exhibited a drawing by Mr. W. G. Smith of a specimen, received from Mr. Bull, interesting as confirming the notion that *Uropedium* is a monstrous state of *Selenipedium*.

FIRE BLIGHT IN PEARS.

Dr. Masters exhibited specimens of this disease received from Professor Arthur, of New York Agricultural Station. The disease is attributed to *Bacterium*, and happily has not yet been noticed outside the United States. To the naked eye the young shoots look dry, shrivelled, and black as if scorched by fire. Mr. Worthington Smith undertook to report.

Floral Committee.

Present: G. F. Wilson, Esq., in the chair; and Messrs. H. T. Masters, H. Bennett, W. Bealby, H. Herlot, J. Walker, Shirley Hibbard, W. Wilks, G. Duffield, J. Hudson, W. Holmes, R. Dean, C. Nolle, H. Ballantine, J. Dominy, J. O'Brien, G. Paul, J. Douglas, A. F. Leney, and E. Hill.

Mr. W. Bull, Kew's Road, Chelsea, showed *Impatiens Hakkeni*, described in the *Gardener's Chronicle*, vol. xxv., p. 209. The plants shown were healthy, vigorous, and remarkable for the lively tint of rose of the flower. Lower pedicel, a slender habitated plant with a leaf of a light green shade banded transversely with brown, and whose breadth is twice that of its length; *Aphelandra* chrysops, the foliage marked on the lines of main ribs with creamy-white, the flowers and flower-bracts yellow, tipped with pale green—a handsome addition to those already in cultivation. A flower of the handsome *Arrostichia elegans* was shown; and *Pteris* indurata, a species with large foliage, deeply lobed, of cheerful shade of green, the stipe dark brown, and smooth.

Messrs. J. Veitch & Sons, Royal Exotic Nursery, showed a basketful of new hybrid *Gloxinia*s, of which *Iraea* is a brilliant scarlet; *The Moon*, rich purple; *Peppers*, a variety with white and pink; and *Ten-week Stock* (Snowflake), a pure white flower borne on a stout spike, were likewise exhibited by this firm.

Mr. B. S. Williams, Paradise Nursery, Holloway, showed the rare *Dendrobium Willmsianum*; the flowers are waxy-white, round in form, the throat and lip purple; pedicels terete, and stems slender erect; *Sarracenia* hybrida, a dwarf variety, with pitchers, either red or green according to age, that are spotted with white near the apex.

Mr. W. Bealby, Rothampten, showed an *Isyadef Pogonanthum*, taken in Arabia, having semi-double pink flowers; and *Delphinium Colbert*, a very robust spike of a metallic blue.

Mr. Trevor Lawrence, Bart., Burford Lodge, showed several choice *Orchids*—viz., *Phaius Huttonii*, a new species of sepals and petals of pinkish-purple, erect bracts yellow, and lip rose-purple; the flower-stems all 15 inches, and foliage those of the genus generally; *Spathoglottis Augustorum*, having a tall stem surmounted with a corymb of white starry blossoms, with the faint shade of lilac in the centre of each; *Ardisia var. roseum*, possessing a short drooping spike of rose-coloured blooms.

Mr. R. Dean, Rauding Road, Ealing, showed a number of Canterbury Bells, of "hose-in-hose" character, in shades of pink, lilac, and blue; *Everlasting* *Phacelia*, frilly, pink and white; *New Giant*, crimson, and *Mauve Beauty*, *Ten-week Stocks*, fine stout spikes of defined colours; *Carnation Elsie Deans*, of a cerise colour; and flowers of *Malva moschata*.

Mr. Salter, gr. to J. Southgate, Esq., Felbourne, Southsea, showed a flower of *Odontoglossum crispum*, Southgate's variety, and a flower of the type to show difference of marking on the petals; the difference consists in the variety having a large brown patch spread over one-half of the petal from the base upwards.

Mr. White, gr. to C. Dorman, Esq., The Firs, Lawrie Park, Sydenham, showed a fine form of *Odontoglossum*

crispum, named *Imprati*; it is a grand flower, with blue-coloured tints on the lower petals; *O. crispum*, Mrs. C. Dorman, a splendid, large, almost pure white, finely filled flower, of much substance; and *Epiglotium villosum maximum*, a showy, large-flowered variety.

Baron T. Hruby, Pesechik, Bohemia, showed *Odontoglossum crispum Hrubyanum*, with dark purplish spots of a large size over all parts of the flower.

Mr. Nicholas, gr. to Earl Fortescue, Castle Hill, showed a spike of *Ranunculus coccineus*, evidently cut from a plant possessed of considerable vigour.

Colonel E. T. Berkeley, Sibbertoft, Market Harborough, showed *Phalenopsis speciosa* var. *Imperator*, of much darker tints (bright pink) than the type, although the substance, size goes with the latter, which was exhibited alongside.

Some charming varieties of *Papaver* theas came from Rev. W. Wilks, Shirley Vicarage, Croydon; the colours were white, pink, scarlet, and mixtures, of all three, and the flowers were comparatively large.

Mr. J. Naylor, St. Hill's Nursery, Harrow, showed a much crested variety of *Pteris serrulata*; the habit is dwarf, and densely bushy.

Mr. Thurstone, nurseryman, Merlevalle, Wolverhampton, showed seedling *Pinks* with fine markings.

Messrs. Paul & Son, The Great Nurseries, Chesham, obtained a Silver Bankian Medal for boxes of cut *Roses* of good quality, in which were some excellent samples of *Madame Aphose Lavalle*, a *Rose* we do not remember to have observed in good form this season.

Mr. T. Bunyard, nurseryman, Abingdon, Kent, showed a small collection of cut *Roses*, many of which were of fine quality.

Messrs. W. Paul & Son, Waltham Cross, received a Silver-gilt Bankian Medal for a very extensive collection of *Roses* in the cut state, consisting of varieties raised by them, as *Grand Mogul*, a neatly-formed crimson; a seedling from A. K. Williams, Silver Queen, in the way of *Captain Christy*, but smaller as seen; *Tea Rose*, *The Bride*, *Lady of the Lake*, blue-coloured; *Horace Paul*, medium-sized, bright crimson; and *Garden Favourite* and *Mr. Dickens*, two good seedling varieties. Baskets of various kinds were shown besides those in boxes.

A Silver Bankian Medal was awarded to R. J. Measures, Esq., Cambridge Lodge, Canberwell, for a group of miscellaneous *Orchids*, set up with *Ferns*, *Caladiums*, and other plants to flowers. Amongst the *Orchids* were several of the newer *Cypripediums*, a few *Catleyas*, *Vandas*, *Odontoglossum crispum*, *Laelia* *amazonica*, &c.

The permanent exhibitions of Messrs. P. Barr & Sons and Messrs. Thos. Ware, Tottenham, were gay with light flowers in shades of blue, pink, and white. Boxes for hardy plants, and Messrs. G. Paul the 2d, both competing groups being rich in rarer kinds of plants.

Mr. W. Chitty, florist, Stamford Hill, showed a bold foliaged *Coleus*, named *Prince Albert*. The leaves are dark purple marked with crimson and gold.

Messrs. J. Carter & Co., Holborn, showed their *Silene pendula* compacta, double flowers. It is showy as seen in bunches.

Mr. Gordon, Twickenham, showed a few varieties of *Iris Kempteri*, richly potted and handsome.

Odontoglossum hexilatum, Mr. Hollington, came from A. J. Hollington, Esq., Forty Hill, Enfield.

Messrs. H. Cannell & Sons, Swanley, Kent, showed a dark, long-tubed variety of *Fuchsia*, *General Roberts*; *yellow Carnation*, *Pride of Penhurst*; and a number of bedding *Pergandiums* with variegated foliage and semi-double flowers.

Messrs. Kelway & Son, Langport, showed a quantity of cut tuberos of *Gaillardia*, *Glaudiolus ramosus*, *Pentstemon*, *Alisternaria*, *Phloxes*, *Poppies*, &c., and were awarded a Bronze Medal.

FIRST-CLASS CERTIFICATES.

To Baron Hruby, for *Odontoglossum crispum Hrubyanum*.

To Mr. Naylor, for *Pteris serrulata*, "Naylor's Crested."

To C. Dorman, Esq., for *Odontoglossum crispum*, Mrs. C. Dorman.

To Messrs. J. Veitch & Sons, for *Ten-week Stock*, Snowflake.

To Mr. W. Bealby, for *Pergandium punctatum*, Eden March.

To Mr. Trevor Lawrence, Bart., for *Phaius Huttonii*.

To Messrs. W. Paul & Son, for *Rose H.P. Grand Mogul*.

To Mr. T. S. Ware, for *Papaver nudicaule minimum*.

To Mr. W. Bull, for *Aphelandra chrysops*.

To Mr. W. Bull, for *Impatiens Hakkeni*, and to Mr. B. S. Williams, for *Dendrobium Willmsianum*.

To J. Southgate, Esq., for *Ocimum macranthum* Southgate's var.

Fruit Committee.

Present: T. F. Rivers, Esq., in the chair; and Messrs. H. J. Veitch, W. Paul, C. Ross, J. Roberts, W. Denning, W. Warren, C. Norman, G. Bunyard, T. B. Haywood, J. Burnett, G. T. Miles, F. Crowley, F. Rutland, K. Hoag.

The Commissioners of the Cape of Good Hope received a Silver Knightian Medal, for a meritorious exhibit of *Raspberries*, with and without stalks, dried *Peaches*, *Pears*, *Pigs*, and *quinces*, Cape Province, in 1885.

A large cockscomb-shaped dark-colored *Strawberry*, Waterloo, come from the Society's Garden. It is a vigorous grower, cropping well, and is of fairly good quality.

Messrs. Vickers, Collyer & Co., Leicester, showed a few fruits of an American Blackberry, the name of the

and Captain Christy being a good 2d and 3d in that order.

In the corresponding class for six varieties seven lots were put up. J. P. Budd, Esq., was a good 1st, his Princess of Wales and Marie van Houtte being very good; W. Narrows, Esq., was 2d; and W. J. Grant, Esq., was 3d; all showing creditable blooms.

OPEN CLASSES.

Fourteen stands of twelve single trusses of any Rose were put up.—1st, Messrs. Keynes, Williams & Co., with twelve superb blooms of Reynolds Hole; 2d, Messrs. Curtis, Sandford & Co., with Ulrich Brunner; and 3d, Mr. F. Cant, with Mons. Noman. The last named exhibitor was 1st for a like number of fine blooms of Marchal Niel; 2d, Mr. B. R. Cant, with the same variety; 3d, W. J. Grant, Esq., with Marie van Houtte. Each exhibitor in this class got placed.

In the class for twelve blooms of any crimson Roses six stands were put up, the 1st prize going to Mr. George Pince, with Reynolds Hole; 2d, Messrs. Keynes, Williams & Co., with Xavier Olibo in fine form; and the 3d to Messrs. Curtis, Sandford & Co., with Marie Banann.

In the corresponding class for twelve blooms of La France there were seven claimants for honours, all showing good blooms. 1st, W. J. Grant, Esq.; 2d, Mr. F. Cant; and 3d, Messrs. Curtis, Sandford & Co.

The prizes offered for six trusses of any new Rose of 1884 or 1885 brought up three exhibitors, Mr. E. R. Cant securing 1st prize with six perfect blooms of Madame Watteville; 2d, Messrs. Curtis, Sandford & Co., with Benoit Comte; Messrs. George Cooling & Son being a good 3d, with Alphonse Souperet.

LOCAL PRIZES (AMATEURS).

S. P. Budd, Esq., secured the 1st prize and the National Rose Society's Gold Medal for a stand of twenty-four varieties, single trusses; his best blooms were Prince Arthur, Camille Bernardin, and Xavier Olibo; 2d, Mr. J. Jolly.

The Rev. G. E. Gardiner had the best stand of twelve distinct varieties, Mr. J. S. Pope the 2d best, and Mr. H. J. Walker the 3d best.

S. P. Budd, Esq., had the best stand of Teas, nine varieties, Princess of Wales being very good in this stand; 2d, Mr. F. Clerk; 3d, Mr. H. J. Walker.

Bouquets of Roses for the hand (open).—1st, Mr. John Mattock; Messrs. Cooling & Sons being a close 2d, with a good arrangement of small neat blooms in variety.

THE NATIONAL ROSE SOCIETY'S SILVER MEDALS.

Two of the National Rose Society's Silver Medals were awarded to the Rev. J. H. Pemberton and Mr. Frank Cant, the former for the best hybrid perpetual, and the latter for the best Tea or Noisette Rose (Souvenir d'Elise Vardon) in the show.

EALING, ACTON, and HANWELL:

July 7.

HELD in the fine pleasure-grounds of E. M. Nelson, Esq., Hanger Hill, Ealing, in beautiful weather, the exhibition was a great success, exceeding all previous ones in extent—this, too, in spite of the fact that the Richmond show was somewhat perversely put back a week, thus taking the customary Ealing date. Not only were five huge tents entirely filled with exhibits, but the entries were in excess of any previous years. It is worthy of record that in this locality, where cottage gardens and allotments are so warmly encouraged, not only are twenty-six prizes awarded for the best of these, but that also some twenty-eight classes for cottagers at the show, and these brought no fewer than 473 entries, and of vegetables and fruits alone no less than 743 distinct dishes. A finer display of cottagers' produce cannot be seen at any similar exhibition.

Decorative groups formed a feature—one from Messrs. C. Lee & Sons, Hammersmith, quite excellent all that excellent firm's previous efforts. It was not less than 60 feet in length and proportionately broad, and was throughout edged with nice plants of the Bambusa Fortunei variegata, alternated with small Araucaria excelsa, and behind comprised of large numbers of pot Roses, Hydrangea paniculata, Spirea palmata, &c., in bloom; and of Palms, Yuccas, standard Euonymuses, &c., &c., in great variety. Messrs. Fromow & Sons, Chiswick, sent a neat group.

From Mr. Roberts, gr. to the Messrs. Rothschild, Gunnersbury Park, came a choice lot of plants, including some good Orchids, all admirably set up in a carpet of foliage plants.

Mr. Chadwick, gr. to E. M. Nelson, Esq., Hanger Hill, occupied the centre of one tent with a massive group of conservatory plants, which was of a very effective character; and Mr. Hudson, gr. to H. J. Atkinson, Esq., M.P., Gunnersbury House, also had a pleasing group of elegant foliage plants in great variety.

Mr. Chadwick was the fortunate winner of the 1st prize for the best-arranged large group of plants, one of a very pleasing kind, in which Lilliums, Gloxinias, and the striking Pancratiums, told with good effect, a margin of Caladium Belemeyi and Selaginella greatly adding. Mr. A. Wright, Chiswick, was 2d, some good pink Hydrangeas lending colour. Mr. Hudson was 3d, with a pretty but rather thin group; and Mr. Fountain, gr. to Miss Wood, Hanger Hill, 4th.

Ferns are always good here, the best six coming from Mr. Fountain, who had good Davallia Mooreana, Dicksonia antarctica, fine Adiantums in variety. Mr. Smith, gr. to T. Nye, Esq., Ealing, had excellent Davallia elegans, Blechnum brasiliense, &c. Mr. Davis, gr. to H. G. Lake, Esq., Chiswick, had the best four Ferns, and the same exhibitor was 1st for six foliage plants.

Mr. Smith had the best four Caladiums, medium-sized, but well done, Mr. Fontaine coming 2d.

Very fine pyramid Fuchsias, full of growth and bloom, came from Mr. Smith. Mr. Wright, gr. to S. Greenfield, Esq., Hanwell, was 2d with very good plants. Mr. Davis had the best zonal Pelargoniums, good compact plants. The finest plants of Coleus, huge bush forms of Baroness Rothschild, Mrs. Simpson, Ada Sentance. The best Begonias, in bloom, came from Mr. Sutton, gr. to Mrs. Williamson, Ealing, and Mr. Fontaine had the 2d best. A remarkable feature was found in the six huge pyramids of mosses sent by Mr. Wright, of Chiswick; each grew 24 to 3 feet high, and proportionately broad. They were admirably done, and comprised Selaginella Martensii, M. stolonifera, M. variegata, uncinata, Kraussiana, and K. variegata.

CUT ROSES.

The open class for twenty-four trebles was not so well filled as on previous occasions, doubtless owing to the great heat which prevailed. Mr. C. Turner found it an easy task to win the 1st prize; and Mr. Rumsey, Watham, came 2d. The kinds shown were those so often recapitulated. Mr. Turner's blooms being excellent. This exhibitor also took the 1st prize for twelve Teas in the popular kinds; Mr. Elliot, gr. to Joseph Moore, Esq., Ealing, and Mr. Langdon, Ealing, following with credit in an adjoining class. Mr. Langdon was a good 1st with admirable fresh blooms. Mr. Sutton had the best box of stove Pelargoniums, Mr. Fulford, gr. to J. Boosey, Esq., Acton, the best cut Gloxinias; and Mr. Wright the best box of zonal Pelargoniums.

Good stove and greenhouse flowers came from Mr. Stevens, gr. to F. Tautz, Esq., and Mr. Chadwick, who also had the best hardy flowers. These, with the plants, are but a few mentioned from many, for full details of the exhibit would be impossible.

A handsome wedding bouquet from Mr. J. Morris, Acton, took 1st prize in one class, and Mrs. G. Weedon, Ealing, had the best bouquet of Roses. In the chief class for dinner-table stands, Mrs. Hudson, Gunnersbury, won a silver salver with arrangements hardly up to her usual form. Mrs. Chadwick, Hanger Hill, came 2d, and Miss Dean, 3d, with very pleasing stands. Floral baskets were numerous and pretty, one composed of orange-scarlet Begonias, with foliage was much admired. Mr. H. B. Smith, Ealing, had two superb bouquets, one having a base of Lillium lancifolium rubrum, dressed with single flowers of Odontoglossum Alexandræ, and the other of white, scarlet and rose Carnations; also some beautiful sprays for ladies adorned. From Messrs. J. Veitch & Sons, and C. Lee & Sons, came fine collections of cut Roses.

Fruit and vegetables were abundant and excellent. Mr. Lockie, gr. to Lord Ocho Fitzgerald, Oakley Court, Windsor, staged some fine Melons, Beauty of Windsor being of such splendid quality as readily to secure a Certificate of Merit. Of Grapes, Mr. Wilson had the best blacks in fine Hamburgs; Mr. Baird, gr. to C. A. Daw, Esq., Ealing, having good Madresfield Court. Mr. Smith had in white kinds good Muscat of Alexandria, and Mr. Baird, Foster's Seedling. This latter exhibitor had the best collection of fruits. The best Strawberries came from Mr. Galandring, gr. to B. Eingley, Esq., Greenford, whose dishes of Jas. Veitch and Sir J. Paxton were grand. Mr. Wilson took 1st prize for vegetables with an admirable collection.

SIDCUP HORTICULTURAL: July 10.

The leading feature of this exhibition was Roses, and for a suburban district it had a Rose show of extraordinary dimensions and of unusual interest. Prizes were offered in four classes, open to all comers, and in that for forty-eight varieties, single to crosses, eight lots competed, the exhibitors representing some of the best and most amateur growers of the day. The 1st prize was awarded to T. W. Girdleston, Esq., Sunningdale, who set up a magnificent lot of blooms—as good a lot as we are likely to look upon this season, comprising Crown Prince, Victor Verdier,

Jean Ducher, Reynolds Hole, Marie Finger, Charles Leveuf, Madame Emma Hall, Abel Carriere, Comte Raimboud, Baroness Rothschild, Dr. Sewell, Souvenir de Madame Alfred Vy, Mons. Noman, Prince Arthur, Madame Geo. Schwartz, Marie Baumann, Merveille de Lyon, Duke of Teck, Marquise de Castellane, Star of Waltham, Bride of Waltham, Madame A. Dumesnil, Duchesse de Valombrosa, Horace Vernet, Etiole de Lyon, Henri Ledebaux, Madame Bravy, Jean Lamy, Souvenir d'Elise Vardon, Thomas Mills, Caroline Kuster, Etienne Levot, Mons. E. Y. Teas, Catherine Mermet, Françoise Michelon, Innocenta Pirola, Général Jacqueminot, A. K. Williams, Constantine Treitakoff, a beautiful cerise-red Rose; Lord Macaulay, &c. The foregoing may be taken as a good selection of cut Roses for show purposes. 2d, Mr. B. R. Cant, nurseryman, Colchester, with a fine lot of blooms, a few of the most striking being Comtesse d'Oxford, Earl of Pembroke, Louis van Houtte, Reynolds Hole, Merveille de Lyon, Jules Chretien, bright crimson-red, large and full; Queen of Queens, very fine; Charles Leveuf, A. K. Williams, Souvenir d'Elise Vardon, Marie Baumann, Etienne Levot, Ulrich Brunner. A fine stand, shown by Messrs. Paul & Son, Chesham, should have been placed 3d, but a collection from Mr. W. Rumsey, Waltham Cross, was preferred to it, Messrs. Paul & Son receiving an extra prize. A good collection from Mr. F. Cant, Colchester, had to be disqualified through containing two blooms of Madame de Watteville.

In the class for twenty-four varieties Mr. B. R. Cant was placed 1st, with a good lot, comprising Horace Vernet, Marquise de Castellane, Duchesse de Moray, Comtesse d'Oxford, Alfred Colomb, Le Havre, Madame de Watteville (the Colchester soil appears to bring out this Tea-scented variety in fine character), Marchal Niel, Madame Eugene Verdier, A. K. Williams, &c.; 2d, R. E. West, Esq., Reigate; 3d, T. W. Girdleston, Esq. It will thus be seen that the amateurs were more than equal to some of the most noted trade growers.

The best twelve Teas and Noisettes came from Mr. B. R. Cant, who had remarkably fine flowers of Catherine Mermet, Souvenir d'Elise Vardon, Comtesse de Nadiailles, Marchal Niel, Souvenir d'Ami, Etiole de Lyon, Madame de Watteville; 2d, Mr. F. Cant, with a remarkably good lot also; 3d, Messrs. Geo. Bunyard & Co., Maidstone.

T. W. Girdleston, Esq., had the best six trusses of any one variety, staging fine Marie Baumann; 2d, Mr. B. R. Cant, with Ulrich Brunner; 3d, Mr. F. Cant, with Marchal Niel. Several fine lots were exhibited in this class.

In addition to the foregoing prizes many others were offered for the encouragement of amateur Rose culture, and some very good flowers were staged in the classes. Mrs. Fuller, of Bexley, had the best twenty-four, and also the best twelve; Mr. G. T. Ongley, of Eltham, being 2d in both classes. Mr. E. A. Lockhart, Sidcup, had the best six; Mr. S. Hodgkinson, Sidcup, being 2d. Mr. Ongley had the best six. Tea-scented varieties, Mrs. Fuller being 2d.

Special prizes were offered by several of the trade growers; thus Messrs. Geo. Bunyard & Co. offered prizes for twenty-four Roses, twelve H.P.'s and twelve Tea-scented, Mr. G. T. Ongley being 1st; Mr. W. Rumsey, Waltham Cross, offered prizes for the best twelve Roses, and Mr. Ongley again beat all the competitors. Mr. B. R. Cant's special prize for eighteen blooms went to Mr. Fuller of Bexley. Sidcup and Bexley grow good Roses, for Strawberries and other fruits are largely grown there, and what suits the latter, appears to do well for Roses also.

It is not necessary to go into detail in reference to the many classes in the schedule for plants, flowers, &c., but it may be mentioned that the Silver Medal of the Society was awarded to Mr. Thomas Crisp, gr. to Earl Sydney, Frogna, Foot's Cray, for a group of plants, including some admirable pot Vines; while a fine group of fruit trees in pots from Messrs. Thomas Rivers & Son, Sawbridge-wood, consisting of Vines, Peaches, Nectarines, Cherries, Apples, Plums, Figs, &c., and a large and showy group of plants from Mr. B. S. Williams, Victoria Nurseries, Holloway; one from Messrs. J. Laing & Son, nurserymen, Forest Hill, including some fine Begonias; and one from Messrs. James Carter & Co., Holborn and Forest Hill, containing among other things some excellent Stocks growing in pots, were highly commended.

AYLESBURY FLORAL AND HORTI-

CULTURAL: July 8.

THE annual exhibition of this Society took place, as usual, in the Corn Exchange and Meat Market, in the centre of the town; and, though the buildings do not show off the exhibits to the same advantage as tents, they were certainly cooler, besides being so central. It was an exhibition decidedly in advance of that of last year, and, large as the buildings are, they were scarcely roomy enough to take all the exhibits sent for competition.

GROUPS OF PLANTS

were a good feature, and were found round the sides of the Corn Exchange, tables being placed down the centre. Lord Rothschild's special prize was awarded to Mr. Alfred Bradshaw, gr. to Baron F. de Rothschild, Waddesdon, Aylesbury, for a bold group, consisting of specimen Palms, Crotons, Orchids, Caladiums, Ferns, including some fine *Troica superba*, &c. In competition for the special prizes given by the President, Alfred de Rothschild, Esq., for the best collection of plants arranged for effect, Mr. Gibbs, gr. to Miss Alice de Rothschild, Elythorp, Aylesbury, was placed 1st, having a fine group, comprising Orchids in variety and other flowering plants mingled with Palms, Ferns, &c.; Mr. Shrimpton, gr. to Lady de Rothschild, Aston Clinton, Tring, was 2d, also with a good collection.

Baron F. de Rothschild offered special prizes for the largest and best collection of plants, the 1st prize going to Mr. Gibbs; Messrs. Ingram & Whitfield, florists, Aylesbury, being 2d. The competition in the foregoing class was very great.

There was a class for the best general collection of plants, flowers, and fruit; and Mr. Robins, gr. to E. D. Lee, Esq., Hartwell, Aylesbury, was 1st, fruit being a strong point; Mr. Maggs, gr. to C. Threlfall, Esq., Aylesbury, 2d.

FERNS.

Mr. Shrimpton staged the best six plants, putting up good specimens of *Dicksonia antarctica*, *Adiantum brasiliense*, *Adiantum formosum*, A. Farleyense, A. Acanthum, and *Gymnogramma chrysochyla*; 2d, Mr. C. Neal, gr. to H. Cazenove, Esq., Aylesbury. Mrs. Gunn, Aylesbury, had the best three varieties; H. Guney, Esq., Aylesbury, being 2d; the latter staged the best three Mosses.

BEGONIAS.

Some excellent tuberous-rooted Begonias were shown by Mr. Wheeler, gr. to F. Parrot, Esq., Aylesbury, and no one visiting country shows can help being struck with the marked improvement in the culture of these during the past few years. Mr. H. Cazenove was 2d.

There were other classes for plants, but those mentioned were the leading features in the plant classes.

CUT FLOWERS.

Roses were a leading feature, and a special prize for twenty-four blooms brought a good competition: Mr. J. Walker, nurseryman, Thame, being 1st, with fine blooms of *Marquise de Castellane*, *Reynolds Hole*, *Comtesse d'Oxford*, *Charles Lefebvre*, *Mille Lionnaire*, *Senateur Vuisse*, *Prince Camille de Rohan*, *Marie Van Houtte*, *Maréchal Niel*, &c.; 2d, Mr. Gibbs. Mr. H. Cakbread, gr. to Sir P. Rose, Bart., Raynes Penn, had the best (thirty-six varieties). Mr. Robins being 2d. In the class for twelve varieties, Mr. T. Austiss, Brill, Bucks, was 1st; and Mr. C. A. Lippincott, 2d. There were prizes for collections of cut flowers, for florist flowers in six varieties—*Carnations* and *Piotees*, &c., but the classes contained nothing worthy of special notice.

The best three pieces for table decoration came from T. E. Barnett, Esq., Aylesbury (Mr. White, gr.), made up mainly with varieties of *Centaurea minor*, and very pretty they were: Mr. Smith, gr. to the Duke of Buckingham, Wootton, Bucks, was 2d.

FRUIT

was fairly well represented. The only exhibitor of twelve dishes in competition for the special prize given by Leopold de Rothschild, Esq., was Mr. Robins, who had Black Prince and Foster's Seedling Grapes, Grosse Mignonne, and Early York Peaches; Lord Napier and Violet Hative Nectarines, Figs, Strawberries, Melon, &c. In the class for two bunches of Grapes, Mr. G. M. Giles, gr. to Lord Carrington, Wycombe Abbey, was 1st, with fine examples of Gros Maroc and Muscat of Alexandria. Mr. Cakbread being 2d, with event Black Hamburg, and Foster's Seedling. Mr. Morton, gr. to H. A. P. Cooper, Esq., Aylesbury, had the best three dishes of Strawberries, staging good fruits of Amateur, President and James Veitch. Mr. Cazenove had the best two dishes, stagio Empress Eugénie and President. Mr. Cakbread had the best dish of Peaches in Belle Bauce, a very fine half-doz indeed. Mr. Robins being 2d.

VEGETABLES

were extensively and finely shown, and filled a considerable space of tabling. Excellent specimens of these are grown about Aylesbury, but the drought is being felt there, and rain is urgently needed, especially by the main crops of Potatoes.

Tsuga Sieboldii.—A fine specimen of this was shown at Liverpool by Messrs. Barron, of Borrowash. It is like the common Hemlock Spruce, but has bolder foliage, and is hardier, starting in spring some two or three weeks after the variety nana.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, JULY 14, 1886.

MONTH AND DAY.	BAROMETER.		TEMPERATURE OF THE AIR.				HYGROMETRIC DECISIONS FROM GLAISHER'S TABLES 5th Edition.		WIND.	RAINFALL.

- July 8.—Fine day, overcast at times.
- 9.—Fine, occasionally overcast.
- 10.—Dull.
- 11.—Fine day.
- 12.—Rain in early morning, and all the afternoon.
- 13.—Rain in early morning; fine day; rain between 11 a.m. and midnight.
- 14.—Fine and bright in early morning, and at times during the day; heavy rain from 8.45 a.m. to 9 a.m. Strong wind.

LONDON: Atmospheric Pressure.—During the week ending July 10, the reading of the barometer at the level of the sea increased from 30.30 inches at the beginning of the week, to 30.34 inches by 9 A.M. on the 4th, decreased to 30.26 inches by 5 P.M. on the same day, increased to 30.29 inches by 9 A.M. on the 5th, decreased to 29.80 inches by 9 A.M. on the 8th, increased to 30.19 inches by 9 A.M. on the 10th, and was 30.18 inches by the end of the week.

The mean reading of the barometer for the week was 30.09 inches, being 0.17 inch lower than last week, and 0.10 inch below the average of the week.

Temperature.—The highest temperature in the shade in the week was 86°.8 on the 7th; on the 9th the highest temperature was 63°.5. The mean of the seven high day temperatures was 76°.5.

The lowest temperature was 48°.0 on the 10th; on the 5th, the lowest temperature was 61°.0. The mean of the seven low night temperatures was 56°.2.

The greatest range of temperature in one day was 29°.2, on the 6th; on the 8th the smallest, was 8°.5. The mean of the seven daily ranges was 20°.3.

The mean temperatures were, on the 4th, 71°.7; on the 5th, 71°.0; on the 6th, 69°.2; on the 7th, 69°.3; on the 8th, 61°.8; on the 9th, 56°.4; and on the 10th, 57°.6; of these the first four were above their averages by 10°.4, 9°.5, 7°.6, and 7°.5 respectively, and the rest were below by 0°.2, 5°.7, and 4°.6 respectively.

The mean temperature of the week was 65°.3, being 1°.9 higher than last week, and 3°.5 above the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun, was 139°.5 on the 6th. The mean of the seven readings was 122°.8.

Rain.—No rain fell during the week.

ENGLAND: Temperature.—During the week ending July 10, the highest temperatures were 88°.0 at Cambridge, 86°.8 at Blackheath, 83°.5 at Nottingham, the highest at Newcastle was 70°.0, at Liverpool, 72°.0, at Bradford, 78°.6. The general mean was 80°.9.

The lowest temperatures were 40°.0 at Sheffield, 41°.6 at Wolverhampton, 43°.0 at Truro; the lowest at Brighton was 52°.0, at Liverpool 50°.7, at Preston, 50°. The general mean was 46°.1.

The greatest ranges were 44°.2 at Cambridge, 43°.0 at Sheffield, 40°.2 at Wolverhampton; the least ranges were 21°.3 at Liverpool, 23°.0 at Newcastle, 26°.0 at Brighton. The general mean was 34°.8.

The mean of the seven high day temperatures was highest at Cambridge 77°.4, at Blackheath 76°.5, at Plymouth 75°.0; and was lowest at Newcastle 65°.5, at Liverpool, 65°.7, at Preston 69°.9. The general mean was 72°.3.

The mean of the seven low night temperatures was highest at Brighton 56°.5, at Blackheath 56°.2, at Plymouth 55°.0, and was lowest at Sheffield 43°.0, at Wolverhampton 50°.2, at Cambridge 51°.2. The general mean was 53°.1.

The mean daily range was greatest at Cambridge 26°.2, at Wolverhampton 22°.9, at Sheffield 22°.6, and was lowest at Liverpool 11°.9, at Newcastle 14°.2, at Preston 15°. The general mean was 19°.2.

The mean temperature was highest at Blackheath 65°.3, at Plymouth and Brighton 63°.1, and was lowest at Newcastle 56°.5, at Sheffield 57°.4, and at Liverpool 57°.9. The general mean was 60°.8.

Rain.—The largest falls were 0.14 inch at Nottingham, 0.11 inch at Leeds, 0.08 inch at Preston; the smallest falls were 0.02 inch at Brighton and Cambridge. No rain fell at Plymouth, Bristol, Blackheath, Wolverhampton, Sheffield, or Liverpool. The general mean fall was 0.04 inch.

SCOTLAND: Temperature.—During the week ending July 10th, the highest temperature was 78°.0, at Aberdeen, at Paisley the highest was 66°.8. The general mean was 72°.1.

The lowest temperature in the week was 37°.5, at Perth; at Leith the lowest temperature was 44°.1. The general mean was 41°.4.

The mean temperature was highest at Perth 58°.5, and lowest at Greenock 55°.8. The general mean was 57°.5.

Rain.—The largest fall was 0.55 inch at Dundee, and the smallest fall was 0.07 inch at Aberdeen. The general mean fall was 0.26 inch.

JAMES GLAISHER, F.R.S.

SUMMARY OF TEMPERATURE, RAINFALL, AND DURATION OF BRIGHT SUNSHINE in the United Kingdom, for agricultural and sanitary purposes, for the week ending Monday, July 12, 1886, issued by the Meteorological Office, 116, Victoria Street, London, S.W. The weather continued fine during the earlier days of the period, but subsequently became cloudy or dull, with a general, but not heavy, fall of rain.

The temperature has equalled the mean in the "Midland Counties," "England, S.," and the "Channel Islands," but in all other districts it has been below it, the deficit ranging from 1° in "Scotland, E.," and "England, S.W.," to 3° in "Ireland, N.," and 4° in "Scotland, N." The highest of the maxima, which were registered on the 6th over England and in most parts of Ireland, and on the 11th in Scotland, ranged from 65° in the N. and W. of Scotland to 75° in "England, N.E.," and "Ireland, S.," 76° in the "Channel Islands," and to 85° in "England, S.," and 87° in "England, E." The lowest of the minima, which were recorded either on the 9th or 10th, ranged from 33° in "Scotland, N.," 35° in "England, S.W.," 37° in "Scotland, E.," and 38° in "Scotland, W.," to 44° in "England, S.," and to 50° in the "Channel Islands."

Rainfall has been a little more than the mean in the south-west, south, and east of England, and equal to it in the north of Scotland, but in all other parts of the Kingdom it has been less than the normal value.

Bright Sunshine has been more prevalent than it was last week in the north and east of Scotland, but in all other districts a decided decrease is shown—especially in Ireland. The percentages of the possible amount of duration ranged from 20 in "Ireland, N.," and 24 in "Ireland, S.," to 43 in "England, S.," 41 in "Scotland, E.," and "England, S.W.," and to 62 in the "Channel Islands."

Depressions observed.—Some large, but shallow disturbances passed in an easterly direction to the northward of Scotland, and a very few small and shallow subsidaries over our islands, but beyond these no depressions have appeared in our neighbourhood. Light to moderate breezes from between N. and N.W. to H. have been most general over the

United Kingdom, but towards the end of the period the wind on our W. and N.W. coasts backed to the south, and increased considerably in force.

* OUR TELEGRAPHIC ADDRESS.—Our correspondents are requested to bear in mind that our Registered Telegraphic Address is "GARDENERS, LONDON." Telegrams (but not letters) thus addressed will reach the Editor, or the Publisher without other address being needed.

AGARIC IN MUSHROOM-HOUSE: R. M. L. No; the Agaric is neither Agaricus venus nor A. phalloides, but a large white variety of A. cepesipes, and probably of exotic origin. The first mentioned fungus is a mere variety of the second. W. G. S.

BOUQUARDIA: G. Russell. Unfortunately too common. Cut the plants in hand—the young growth that follows may be healthy. We know neither the cause nor the cure.

CAFE BEANS: E. G. H. Most of these enjoy a warmer temperature than that of a greenhouse, and you could not do better than to pot them at once into pots just large enough to hold the bulb, sinking them to about half their depth in the soil, which should consist of sand, not too much of the latter. All bulbs like very firm potting, so see that the soil below the bulb is formed before placing the bulb thereon, and that the soil around it is made firm with the hand. Put the plants by themselves, as they usually abound with mealy-bug and other pests. A pit or frame on a mild hotbed of leaves will suit them, especially if about 6 inches of finely sifted coal-ashes be placed over the surface, into which the pots may be plunged. Give little or no water until signs of growth appear, and afterwards it must be given with great care. A shelf in a stove near the light will suit them during the winter. After treatment will depend on the species and the time the bulbs flower.

CORRECTIONS AND ADDENDA.—Messrs. Sutton & Sons, Reading, received a Gold Medal, and not a Bronze, for their fine display noticed in our report of the Provincial Show of the Royal Horticultural Society at Liverpool. Mr. Lantons's new Strawberry, "Noble," at the same show, was awarded a First-class Certificate.—At p. 56, "Miscellaneous," in report of Tunbridge Wells Show, for Mr. A. H. Webber, Tunbridge Wells, read, Mr. F. Webber, Tonbridge.

FRUIT TREES: J. F. After laying-in now what young wood is required on Pears and Plums, the foreright and other wood of 41. Vegetation in Kent, and to make them payable to William Richards, at the Post-Office, Drury Lane, London, W.C.

FOREIGN SUBSCRIBERS sending Post-Office Orders are requested to send them to the Publisher of this Chronicle, 41, Wellington Street, Covent Garden, and to make them payable to William Richards, at the Post-Office, Drury Lane, London, W.C.

COMMUNICATIONS RECEIVED.—W. H. F.—D. M.—T. H. P. Drinkstone Park.—J. A. Arthur, New York.—G. A. G. J.—Ed. Adair, Paris.—J. W.—A. K.—T. C.—W.—S. I.—O. W.—J. F.—T. M.—H. G. R. W. G. S.

FUNGI ON PLANTS: H. Munro. 1, on Silver Fir is Peridermium elatum; 2, on leaves of Strawberries is Oidium balsam, described and illustrated in Gardeners' Chronicle, September 25, 1886—also common on Turnip-leaves; 3, on Viola leaf Ecidium depauperans, described and illustrated in Gardeners' Chronicle, September 16, 1886. W. G. S.

GENERAL INDEX TO BOTANICAL PLATES: W. H. T. Pritz's Iconum Botanicoorum Index is the work you want. The supplements bring the work down to 1886. Our index of young growths whilst still green and sold would be the better way, as then less of the vigour of the trees would be wasted in wood which at last has to be sacrificed.

GRAFTING BLACK HAMBURG AND MADRESFIELD COURT VINES ON ROYAL MUSCADINE: Old Subscriber. We do not doubt the capability of this as a stock for either of these, but it would be likely to cause diminution of fruit, and to be very likely to influence the flavour. The experiment is worth trying.

INSECT ON ORCHID: J. H. G. The specimens were smashed in the post; send some wrapped in damp blotting-paper, and enclosed in a tin box.

INSECTS: W. P. & Son. It is one of the weevils, which are all very destructive to vegetation. The insects feed during the night, when they may be caught by spreading a sheet beneath the Vines or other plants being attacked, and then going into the houses suddenly with a light; many are thus scared and fall on the sheet; these should be quickly collected and destroyed. During the day the insects hide in chinks and under stones, where they can be destroyed in great numbers by pouring in not-water into their haunts. By following up these methods the creatures can be kept within bounds.

INSECTS IN PEAR TREE BARK: J. R. In the spring and early summer the larvae can be killed in the holes by inserting a piece of wire, or by the application of strong insecticides injected by means of a small syringe into the holes. Where the insects, abound it will be

found a better practice to coat the stems and main limbs with a mixture of clay, lime, and soot, to which a little tar or spirits of tar can be added. This is not unsightly, and is distasteful to most living things.

MOSS ON TREES: W. G. S. Moss is not injurious when not over-abundant, but it is often a sign of water stagnant in the soil, and of great moisture in the surrounding air. During winter, when the ground when the moss is damp, with powdered quicklime, or white-washing the trees, will rid you of the objectionable parasite.

NAMES OF PLANTS: A. Young. The shrub is Rubus odoratus, the flower the Parrot Tulip.—W. F. A medium-sized flower of Phalenopsis grandiflora, not P. amabilis.—E. M. The Thunus is very likely Marshallia.—W. S. A nice pale form of Cattleya Gaskelliana.—Barr & Son. Gladioli communis.—M. & C. Sibthorpia peregrina.—E. H. F. Linaria Pellerisiana.—H. J. R. A very bad common Cattleya Elrodiana.

SUBJECTS TO PLANT IN A HEATRO HOUSE OF 60 FEET IN LENGTH AS SUGGESTED BY MR. H. H. You might grow Tomatos and Cucumbers together or separate for early work, or very late Grapes of good keeping kinds. In plants there are numerous subjects. You might cover the roof with Stephanotis floribunda, growing Adiantums underneath; or you could grow Marzella and Rose.

VINE LEAVES: C. H. Your Vines leaves have the appearance of having been burnt. The ventilation has probably not been well attended to and the house may be too dry. There is neither disease nor decay present; want of attention to the above details is the cause of the appearance.

WEED ON LAWN: R. C. Crepis biennis. When did you mow your lawn last? You are doing the best way to check your lawn with this weed. Copious mowing will favour the grasses and proportionately enfeeble the weeds. Meantime carefully cut off all the flowers to prevent their seeding.

WHITE-SKINNED CUCUMBER: Cucumer. The form is that of the common ridge variety the "short prickly," only the spines are quite rudimentary. You have clearly been deceived by the words "white-skinned" unintentionally, the differences between the "Telegraph," and this one being too marked for any one to fancy he could send out the one for the other.

* All communications intended for publication should be addressed to the "Editor." Such communications should be written on one side only of the paper and sent as early in the week as possible to the printer, who sends newspapers should be careful to mark the paragraphs they wish the Editor to see.

INTELLIGENT READERS, DO PLEASE NOTE.—Letters relating to ADVERTISEMENTS, or to the supply of the Paper, should be addressed to the Publisher, and NOT to the Editor.

FOREIGN SUBSCRIBERS sending Post-Office Orders are requested to send them to the Publisher of this Chronicle, 41, Wellington Street, Covent Garden, and to make them payable to William Richards, at the Post-Office, Drury Lane, London, W.C.

COMMUNICATIONS RECEIVED.—W. H. F.—D. M.—T. H. P. Drinkstone Park.—J. A. Arthur, New York.—G. A. G. J.—Ed. Adair, Paris.—J. W.—A. K.—T. C.—W.—S. I.—O. W.—J. F.—T. M.—H. G. R. W. G. S.

Markets.

COVENT GARDEN, July 15.

[The subjoined reports are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list weekly, and are responsible for the quotations. It must be remembered that these quotations are averages for the week preceding the date of our report. The prices fluctuate, not only from day to day, but often several times in one day, and therefore the prices quoted as averages for the past week must not be taken as indicating the price at any particular date, still less can they be taken as guides to the price in the coming week. Ed.]

OUR market is heavily supplied with all classes of goods, and clearances are only made at a sacrifice, James Webber, Wholesale Apple Market.

FRUIT.—AVERAGE WHOLESALE PRICES.

Table with 2 columns: Fruit and Price. Includes Cherries, Currants, Figs, Grapes, Lemons, Melons, Peaches, Pine-apples, Onions, Strawberries.

VEGETABLES.—AVERAGE RETAIL PRICES.

Table with 2 columns: Vegetable and Price. Includes Artichokes, Asparagus, Beans, Beet, Carrots, Cauliflowers, Cery, Coleworts, Cucumbers, Endive, Herbs, Leeks, Lettuce, Mint, Mushroom, Mustard, Onions, Parsley, Potatoes, Radish, Shallots, Spinach, Spinae, Tomatoes, Turnips, Veget. Marz., Watercress.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table with 2 columns: Plant and Price. Includes Aralia Sieboldii, Bedding Plants, Begonias, Bouvardias, Cactularias, Cypripedium, Dracena terminalis, Ericas, Erythraea, Ferns, Evergreens, Ficus elastica, Geraniums, Heliosyris, Liliun longiflorum, Marguerites.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table with 2 columns: Flower and Price. Includes Arum Lilies, Aster, Bouvardias, Campanulas, Carnations, Calliophorus, Cassia, Delphiniums, Eucharis, Forget-me-Not, Myosotis, Geraniums, Lagueria, Lilium candidum, Lilium longiflorum, Marguerites, Mignonette, Pansies, Peonies, Pelargoniums, Pyrethrum, Rhododendros, Sweet Peas, Sweet Sultan, Tuberoses.

CORN.

MARK LANE, July 15.—The Wheat trade opened with a firmer tone, which improved towards the close, and rather better prices were obtained for some descriptions of foreign. The flour trade was slow, and the large imports into London are against prices, but the receipts of English are very small, which is calculated to help them a little. Barley was firm, and met rather more inquiry. Beans were also firm at late rates. With rather more supply Peas were 6d. lower on the week. The heavy arrivals of Oats have put the market rather in favour of buyers.

July 14.—There was not much animation in the trade to-day, but the tone was steady. Both English and foreign Wheat supported Monday's prices. Flour met inquiry, and remains unscarce. Barley was steady, with a moderate demand. Oats were slow of sale. Beans tended against buyers, and Peas sold slowly at Monday's rates.

FRUITS AND VEGETABLES.

COLUMBIA (East London): July 14.—Plentiful supplies, for which there was a fair demand. Prices:—Black Currants, 5s. to 5s. 6d. per half sieve; red currants, 4s. 6d. to 5s. 0d.; Gooseberries, 3s. 6d. to 5s. per bushel; Raspberries, 5s. to 6s. 6d. per peck; Cabbages, 5s. to 7s. 6d. per tally; bunch Greens, 3s. to 3s. 6d. per dozen bunches; do. Onions, 4s. to 4s. 6d. do. Carrots, 3s. 6d. to 4s. do.; Broad Beans, 2s. 6d. to 3s. 6d. per sieve; Peas, 2s. 6d. to 3s. 6d. per bushel; Lettuce, 10s. to 12s. 6d. per score; Mint, 2s. per dozen bunches; Parsley, 2s. 6d. do.

STRAFORD: July 13.—There was a good supply, and a fair trade at the following prices:—Cabbages, 4s. to 6s. per tally; Greens, 1s. to 1s. 6d. per bunch; Onions, 11s. to 14s. per ton; Peas, 3s. to 5s. 6d. per bag; Lettuce, 10s. to 12s. per score; Cherries, 5s. to 6s. per bushel; Gooseberries, 3s. 6d. to 4s. 6d. per sieve; do., green, 1s. to 2s. do.; Currants, black, 3s. 6d. to 4s. 6d. per sieve.

POTATOS.

BOROUGH AND SPITALFIELDS: July 13.—Fair supplies of foreign, and fairly suitable assortment. English conditions:—Jersey and Kent Kidneys, 6s. to 7s.; rounds, 3s. 6d. to 4s. per cwt.

COLUMBIA (East London): July 14.—Quotations:—Jersey Kidneys, 6s. 6d. to 8s.; do. rounds, 5s. to 6s.; St. Malo Kidneys, 6s. to 7s. 6d.; do. rounds, 4s. 6d. to 5s. 6d.; Cherbrough Kidneys, 6s. 6d. to 7s. 6d.; do. rounds, 4s. 6d. to 5s. 6d. per cwt. Magnums, 5s. to 6s.; Champions, 4s. to 5s. per ton.

HAY.

WHITECHAPEL: July 13.—The supply was short, and there was a fair demand at the best qualities. Quotations:—Clover, prime, 90s. to 107s.; inferior, 70s. to 85s.; hay, prime, 70s. to 95s.; inferior, 45s. to 65s.; and straw, 25s. to 37s. per load.

July 15.—A moderate supply was on sale. The trade was fair, and prices dearer for Clover.

CUMBERLAND (Regent's Park): July 13.—A good supply, with a firm trade for meadow hay, but dull for Clover. Quotations:—Clover, best, 90s. to 105s.; seconds, 75s. to 85s.; hay, best, 54s. to 65s.; seconds, 70s. to 80s.; and straw, 30s. to 35s. per load.

Government Stock.—Consols closed on Monday, Tuesday, and Wednesday at the best qualities. Quotations:—Clover, prime, 90s. to 107s.; inferior, 70s. to 85s.; hay, prime, 70s. to 95s.; inferior, 45s. to 65s.; and straw, 25s. to 37s. per load.

THE GARDENERS' CHRONICLE

(Established 1841)

CONTAINS ARTICLES ON ALL DEPARTMENTS OF

GARDENING, PRACTICAL AND SCIENTIFIC,

REPORTS of EXHIBITIONS, REVIEWS of BOOKS, and NOTICES of all HORTICULTURAL MATTERS of CURRENT INTEREST.

HOME, COLONIAL, and FOREIGN CORRESPONDENCE.

Special attention is given to the following subjects:—

ALPINE PLANTS. ARBORETUM.—The. BEDDING PLANTS. BEES.—BOTANY. BULBOUS PLANTS. CHEMISTRY of PLANTS. CONIFERS. DISEASES of PLANTS. EVERGREENS. EXHIBITIONS.—FERNS. FLORISTS' FLOWERS.

Rosher's Garden Edging Tiles.

THE ABOVE and many other PATTERNS are made in materials of great durability. The plainest sorts are specially suited for KITCHEN GARDENS, as they harbour no Slugs or Insects, take up little room, and, once put down, incur no further labour or expense, as do "grass" Edgings, consequently being much cheaper. GARDEN VASES, FOUNTAINS, &c. in Artificial Stone, very durable and of superior finish, and in great variety of design. F. ROSHER and CO., Manufacturers, Upper Ground Street, Blackfriars, S.E.; King's Road, Chelsea, S.W.; Kingsland Road, E.
Agents for LOOKER'S PATENT "ACME" FRAMES, PLANT COVERS, and PROPAGATING BOXES; also for FOXLEY'S PATENT BEADED GARDEN WALL BRICKS.

HILL and SMITH'S BLACK VARNISH,
for Preserving Wood, or Stone.

This VARNISH is an excellent substitute for oil paint or any outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of forty years ago by the Advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitations, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requiring no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of most of the Nobility and Gentry, from whom the most flattering testimonials have been received. Sold in Casks of about 20 gallons each, at 1s. 6d. per gallon, at the Manufactory, or 1s. 8d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL.

From ALFRED LOWE, Esq., *The Rybys, Altherly Lodge.*
"Some twenty years ago I used your Black Varnish, and shall be glad if you will forward me a cask, as I consider it the best thing known for the preservation of all outdoor work, either wood or iron, that requires to be painted."
CAUTION—HILL & SMITH, particularly warn their Customers against the various cheap Varnishes now so much advertised. Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine. Large Illustrated CATALOGUE on Fencing, Hurdles, Field and Entrance Gates, &c., sent free on application to

CLERK, in the Nursery or Seed Trade.—Good Book-keeper and Correspondent, and well experienced in both branches. First-class testimonials.—A. R., Gardener's Chronicle Office, 41, Wellington Street, Strand, W.C.

FIREMAN and USEFUL MAN in a Nursery.—Has been with Messrs. H. Low & Co. nine years. Can have first-class references.—H. J., 67, Sixth Avenue Bank Hill Park, Epsom.

CARPENTER and JOINER on a Gentleman's Estate.—HOUSE PAINTING and GLAZING if required.—Married, age 33, no encumbrance; abstainer; three and a half years with present employer.—A. BROOKER, Renham, Henlow-on-Thames.

HOLLOWAY'S OINTMENT and PILLS.—Coughs, Influenza.—The soothing properties of these medicaments render them well worthy of trial in all diseases of the lungs. In common Colds and Influenza the Pills take internally and the Ointment rubbed externally are exceedingly efficacious. When Influenza is epidemic this treatment is easiest, safest, and surest. HOLLOWAY'S PILLS and OINTMENT purify the blood, remove all obstructions to the free circulation through the lungs, relieve the over-gorged air tubes, and render respiration free, without reducing the strength, irritating the nerves, or depressing the spirits. Such are the means of saving suffering when afflicted with Colds, Coughs, Bronchitis, and other complaints by which so many are seriously and permanently afflicted in most countries.

SALES BY AUCTION.

New Orchids.

Brought home by Mr. Edward Wallace. MR. J. C. STEVENS has received instructions from the New Plant and Bulb Company to SELL by AUCTION at his Rooms, 67 and 68, Cheapside, E.C., on THURSDAY NEXT, July 22, at half-past 12 o'clock precisely.

A NEW CATILVA collected in a fresh locality. The bulbs resemble somewhat those of *P. Prateri*, the flowers nearly as large, but self coloured, light same colour as sepals and petals, with rich orange throat; many are pure white, others nearly so, very brilliant and fragrant, six or eight flowers were seen on one spike. Flowers after C. Trianae is over; from a cool locality upon the mountains, about 1300 feet above sea level, and easily grown as C. Trianae. Dried flowers will be shown.

A NEW EPIDENDRUM in the way of E. Stamfordium, but different and far finer. Has much broader and shorter leaves than that species, 4 more dense and richer coloured. Collected at an elevation of 1500 feet above sea level. Growth aloft in tufts on the trees. The spikes are emitted mostly in pairs from the base of the bulb, and were observed to descend 1 to 2 feet, with three to five branches, and large sprays of white or rose-tinted flowers. Described by Mr. Wallace as a most beautiful sight. Dried flowers will be shown.

A NEW WHITE SOBRIALIA-LIKE PLANT, with bunches of flowers looking on the mountain side like masses of snow. With dried flowers.

A WHITE BLETIA, found growing on the mountain slopes in grass and loamy soil. With dried flowers. As the following are new plants: A yellow CATILVA, a yellow CATASELUM, a yellow SCKOMBURKIA, a grand new TERRESTRIAL ORCHID, with flowers a rich, achroic, of a purple colour; and a few plants of MASDEVALLIA FICULATA, the first established plants offered for sale in Europe.

On view morning of Sale, and Catalogues had.

Tuesday Next.

SPECIAL SALE OF SEEDS IN FLOWER. MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION at their Central Sale Rooms, 67 and 68, Cheapside, E.C., on TUESDAY NEXT, July 27, at 12 o'clock precisely, a splendid lot of the best types, also CATILVA SANDERIANA and C. SKINNEI, and various other Orchids, comprising Oncidium, Cattleya, Sanderiana and Gaskelliana, Masdevallia, Haryana sanguinea, seventy five, twenty-five, and thirty-five, and many other Epidendrum, Odontoglossum varieties, and many other ORCHIDS.

On view morning of Sale, and Catalogues had.

Wednesday Next.

MESSRS. PROTHEROE AND MORRIS will include in their SALE OF FLOWERING ORCHIDS, on TUESDAY NEXT, about 150 types, also CATILVA SANDERIANA and C. SKINNEI. MESSRS. Shuttleworth, Gardner, & Co.

On view morning of Sale, and Catalogues had.

Harrow Road, W.

By order of the Executors, Mr. Henry Fuller, of Cheapside sale.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION on the Premises, The Woodfield Nursery, Harrow Road, W., at 10 o'clock precisely, on WEDNESDAY, July 28, at twelve o'clock precisely, the whole of the well-grown stock-in-trade consisting of a complete collection of 2000 SUCCESSFUL COLLECTION, possibly unequalled in this country; a variety of STOVE and GREENHOUSE PLANTS; 2000 Ferns and Palms, specimen Plants and other plants, including the healthy American exotics in 45 pots; the Treasures of FINE GREENHOUSES, 1000 feet HOT-WATER PIPING, BOILERS, nearly new Sprinkler, FAN, FORT, CASK, spring VAN, light brown MARKING, MOULD, LOAM, MANURE, and other effects.

On view prior to sale; catalogues had on the premises, of J. O. Jacobs, of the Executors, Harrow Road, S.E., and of the Auctioneers, 67 and 68, Cheapside, E.C.

Chertsey.

In the village of Chertsey, about 20 miles from London, a healthy and airy site, with a fine view, and five minutes' walk from Egham and Virginia Water Stations. IMPORTANT TO GENTLEMEN and OTHERS seeking a country or FRESH AIR RESIDENCE, a most desirable and commanding business with pleasure. For Sale, with possession.

MESSRS. PROTHEROE AND MORRIS are instructed to SELL by AUCTION, at the Mart, Lokenhouse Yard, City, E.C., on THURSDAY, July 29, at 12 o'clock precisely, the valuable FREEHOLD ESTATE, known as the West End Fruit Garden, Thorne, near Chertsey, embracing a total area of about 40 Acres of excellent Land, well stocked with Fruit Trees and Bushes in bearing condition, and a well-kept Garden, with a fine brick-built residence, containing seven Bedrooms, Dressing-room, fitted Bathroom, three Reception-rooms, two Kitchens, and domestic offices, numerous outbuildings, including a large stable and Stabling; the fruit garden is bounded on one side by a concrete wall, 6 feet in length. The property has a frontage of 100 feet to the River, and is close to Chertsey, a portion of which can be easily utilized for building, without detriment to the remainder of the land. The entire Estate possesses a great prospective building value, and a portion contains a valuable bed of the best gravel in a good depth. May be viewed. Particulars, plan, and conditions of Sale may be had on the Premises, at the Mart, E.C., of W. Sharp, Esq., Solicitor, 9, Abchurch Lane, E.C., and of the Auctioneers and Surveyors, 67 and 68, Cheapside, E.C.

Lewisham.

By order of the Mortgagees. MESSRS. PROTHEROE AND MORRIS are instructed to SELL by AUCTION, at the Mart, Lokenhouse Yard, City, E.C., on THURSDAY NEXT, July 29, at 12 o'clock precisely.

A valuable PLOT of LAND, situate in George Lane, Lewisham, near the entrance of Mr. P. B. Bostwick and used by him as part of his well-established Nurseries, together with the three well-built Houses standing thereon, two being used as one in hand, the whole representing a total net of £58 per annum.

Lot 2.—Four LEASEHOLD COTTAGES, Nos. 58, 59, 60, and 61, in the village of Chertsey, near the River, and producing £275 16s. per annum, and 14 builded Grounds, situate upon 54 and 55, in Green Lane, and houses in rear.

The property may be viewed on any day between 10 and 12 o'clock. Particulars may be had at the Mart of Messrs. HARDE and LODGER, Solicitors, 1, Raymond Buildings, W.C.; and of the Auctioneers, 67 and 68, Cheapside, E.C.

Friday Next. ABRIDES GODEFROYANUM.

MESSRS. PROTHEROE AND MORRIS are instructed by Mr. F. Sander to SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, E.C., on FRIDAY NEXT, July 30, at half-past 12 o'clock precisely, a fine lot of ABRIDES GODEFROYANUM. It is a superb new species, of the genus ABRIDES, described in the *Gardener's Chronicle* for June 25 last, and says:—"The most stately member of the Foxglove group." The flowers can, however, only be compared to those of the *maculatum*. This might be considered a giant *Abrides* affinis, with Lobelia flowers improved. Professor Reichenbach also states that "it produces a magnificent and glorious inflorescence"—a statement which is not exaggerated. We saw the plant in flower a few weeks since.

At the same time will be sold a splendid lot of CATELOVANE PANATA, a new DENSOVIA of the genus CATELOVANE, also another species, no doubt quite new: a yellow SACCOLAHUM, a very pretty and lovely species, the spikes are erect, and the colour is a pale yellow.

Many other fine ORCHIDS will be offered the same day. On view morning of Sale, and Catalogues had.

Friday Next.

CYPRIPEDIUM SANDERIANUM. MESSRS. PROTHEROE AND MORRIS are instructed by Mr. F. Sander to SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, E.C., on FRIDAY NEXT, July 30, at half-past 12 o'clock precisely, a splendid lot of this remarkable and superlative CYPRIPEDIUM, offered for the first time.

CYPRIPEDIUM SANDERIANUM is figured and fully described in the *Keichenbachia*. It stands by itself in its singular and quaint beauty, and is the only *Cypridium* which bears a light hue, the petals are pink-purple, and the tips are quite light, covered with thick hairs.

The pouch is a dark brownish-red. It is all together a showy, refreshing, and first new Orchid, says:—"This is an extraordinary surprise, as well as a great beauty, from the Malayan Archipelago. It is a great pleasure to dedicate this fine orchid to Mr. Sander's name."

On view morning of Sale, and Catalogues had.

Friday Next

NEW CYPRIPEDIUM. MESSRS. PROTHEROE AND MORRIS are instructed by Mr. Sander to include in the SALE at their Rooms on FRIDAY NEXT, a grand importation of a new and highly improved CYPRIPEDIUM. A plant in bloom will be on view.

On view morning of Sale, and Catalogues had.

Dutch Bulbs.—Trade Sales.

MESSRS. PROTHEROE AND MORRIS are instructed to announce that they have arranged the SALES of FINE DUTCH BULBS for the coming season as usual. The first sale is especially well made up of the best and other large buyers, and will commence in AUGUST.

Further particulars next week. 67 and 68, Cheapside, E.C.

Bothwell Castle Collection of Heaths

Very Important Public Sale of the RARE and CHOICE COLLECTION of Heaths, by the Right Honourable Earl of Home, N.B., cultivated by the late Mr. Andrew Turnbull for the Right Honourable the Earl of Home.

MESSRS. MORRISON, DICK, AND McCULLOCH are instructed by the Right Honourable the Earl of Home, to SELL by AUCTION, in Houses Nos. 1 and 2, Bothwell Castle, Bothwell, N.B., on THURSDAY, July 29, at 12 o'clock Noon, the COLLECTION of RARE and CHOICE HEATHS, as they were presented to the Earl of Home in the United Kingdom, and containing many Varieties, some of which are new.

On view at the Garden says:—"The cultivator can scarcely ever possess himself of the different varieties originated by such men as Mr. Turnbull of Bothwell Castle, who has been raised more excellent varieties than any other man of his day."

The whole will be on View in the Houses on Monday, Tuesday, and Wednesday, July 27, 28, and 29, from 10 to 4 P.M., and on Fossenden up till Hour of Sale. To prevent overcrowding, admission by Catalogue only (price varying, reasonable to all purchasers, on application at our office, 97, Sauchhall Street, Glasgow, or forwarded by post on receipt of Sixpence in Stamps).

MORRISON, DICK, & McCULLOCH, Auctioneers.

Stanwell, Middlesex.

FREEHOLD LAND, suitable for Market Garden or Building Purposes; also HOUSE, HOMESTEAD, and Small Dairy Farm, with a well-placed, close to the Villages of Stanwell and West End, within 14 miles of Hyde Park Station, 1 1/2 mile from Ashford Station, 2 1/2 miles from Maidenhead, and 1/2 mile from the Victoria Railway to London, all in a high state of cultivation, and in the occupation of the Vendors, comprising together 91 Acres of the best and most fertile soil, with extensive GRASSES, with extensive Gardens, fronting the road to Ashford Station. Let at low weekly rents.

MESSRS. BUCKLAND AND SONS will SELL the above by AUCTION, in Lots, by order of the Executors of the late Mr. W. C. Buckland, at the "Angel and Crown" Hotel, Staines, on THURSDAY, August 5, at 5 for 6 o'clock P.M., unless an acceptable offer be made previously, at the residence of Messrs. Buckland and Sons, 21, Adam Street, Strand, W.C., and Windsor.

To Nurserymen, Florists, &c.

MESSRS. FLEWITT and GODEFREY are instructed to SELL by PRIVATE CONTRACT, the Goodwill, Growing Stock, Houses, of an OLD-ESTABLISHED NURSERY, established and successfully carried on by the same proprietor for Eighteen years, and now sold on account of the proprietor's declining health and business. The Nurseries and Houses are well stocked with a varied and Saleable Stock. The concern is now in working order, and a young man about to commence business. An immediate purchaser would be liberally dealt with and part of the purchase-money might remain on account. Price £5000 and upwards.

Full particulars of the Auctioneers, 47, Cherry Street, Birmingham.

THE LIVERPOOL HORTICULTURAL COMPANY (John Cows), Limited.

Have a large and fine stock of EAST INDIAN ORCHIDS: and they are constantly receiving fresh Importations from various parts of the world. Full particulars of Orchids in stock, and also of fresh importations to receive, forwarded on application. The Company have also a large stock of TEA and other HERBS in pots, GRAPE VINES, FERNS, and other ORNAMENTAL PLANTS. LISTERS with full particulars on application.

THE VINEYARD and NURSERIES, GARSTON, LIVERPOOL. ADDRESS for TELEGRAMS—"COWAN, LIVERPOOL."

FOR SALE.

NURSERY AND SEED BUSINESS.

THE OLD-ESTABLISHED NURSERY and SEED BUSINESS, so successfully carried on for upwards of 60 years by THOMAS IMRIE and SONS, Ayr. The Nursery Grounds extending 40 Acres, near the Railway Station, and are well stocked with saleable Trees and Shrubs, and there are commodious premises for carrying on the Seed Business. The Nursery is to be Sold either as one, or Nursery and Seed separately; and is being disposed of solely on account of Mr. Imrie's delicate state of health. Full particulars of THOMAS IMRIE and SONS, Ayr, N.B.—June 21, 1885.

TO BE SOLD, an old-established FRUITERER'S, GREENGROCER'S, and FLOWERIST'S, Long Lease, 2000 Yards; every thing for use. Price £250 Apply at 455, Fulham Road, S.W.

TO BE DISPOSED OF, through ill-health, an old-established FLOWERIST and NURSERY BUSINESS, 6 miles from London, S.E. A good trade (no main) is being done, and every satisfaction given for leaving, and back can be inspected. Capital required for fresh hand, buildings, &c. about £6000. For further particulars, apply The Victoria Nursery, Malham Road, Forest Hill, S.E.

FOR IMMEDIATE DISPOSAL, a FLOWERIST'S BUSINESS.—The Proprietor of a large and highly lucrative business, in full swing, which has been established for over twenty years, and is beautifully situated in the main thoroughfare of a large town, commands the traffic from the principal entrance to Kensington Gardens, is desirous of disposing of the same. There is an extensive trade, and the business is carried on at an exceptionally low rental, and the trade return represents a large amount per annum. The books show various records of patronage, and the business is carried on at a great increase, as a large portion of the business is in Hall and Rout gardens, and in the ever increasing demand for floral decorations in refined society at all seasons of the year. The whole stock, plant, goodwill, and lease, will be sold together as a going concern, as the Proprietor, being practically single-handed in the management, now finds it much too great a strain upon him, and he wishes to retire in consequence of ill-health. The entire partnership will only be furnished to Principals or their Solicitors. Apply to

J. A. KING, 29, Queen's Road, D, Finsbury, London, W.

Florists or Gardeners. 5 minutes' walk from Rye House Station, G.E.R.; TO BE SOLD, a Plot of excellent LAND, 1/2 Walled-in, and with Double and Single Gates, and the frontage of 93 feet 5 inches, and having a well-built Glass Greenhouse, each with a separate entrance, and highly adapted for horticultural purposes, or for the erection of a villa residence. Apply to Mr. HENRY BRILLINGFIELD, Ware, Herts; and to, Union Court, Old Broad Street, E.C.

TO BE LET OR SOLD, as a through-going concern, A NURSERY, Comprising 34 1/2 acres, about 50 miles from London, with Shop in Market Place, Good Dwelling House, Greenhouse, Frames, &c. For particulars, apply to F. FLOOD, 57, Albert Street, Mornington Crescent, London, N.W.

To Florists and Others.—Chelsea.

TO BE LET, on a well-walled Garden, Glass and Gardener's Cottage. Apply to J. G. GODEFREY, 13, Bouverie Street, S.W.

TO BE LET, ON LEASE, MARKET GARDEN GROUND at Camberwell, close to the station on the London, Chatham and Dover Railway, containing about 1 1/2 Acres, and three miles of Covent Garden and other Metropolitan Markets.

For particulars, apply to Messrs. DRIVER and CO., 4, Whitehall, London, S.W.

To Landed Proprietors, &c.

A MCINTYRE (late of Victoria Park) is now at liberty to undertake the FORMATION and PLANTING of the GARDENS, GROUNDS and REMODELING existing GARDENS. Plans prepared. 115, Lisson Park, Stamford Hill, N.

CYCLAMEN SEED.

in Sealed Packets, 2s. 6d. and 5s. each, separate colours, red, white, pink, and marginata or mixed.

H. PAGE & SONS are offering for the first time their well-known strain of CYCLAMEN SEED, three Medals by the Royal Horticultural Society during last season, and gained highest honours wherever shown.

Orders will be supplied in 1/2 lb. cellophane, and size; and as the quantity is limited, Orders will be executed in strict rotation, and sent Post-free on receipt of Postal Order after August 1. Application.

H. PAGE AND SONS,

Grove Nurseries, Teddington, S.W.

NORWEGIAN

FISH-POTASH MANURE.

Fish Manure is composed of flesh and bone—the best of all fertilising materials, and in combination with pure Salts of Potash and Magnesia forms a perfect fertiliser, as it contains the important ingredients of Ammonia, Phosphates and Potash in their most concentrated and available form. It is equally valuable for Farm Use, for Fruits, Flowers, and Vegetables, and produces wonderful growth, especially with Vines.

The Average Manurial Constituents are as follows:—

Table with 2 columns: Cod Fish and Potash, Herring and Potash. Rows include Ammonia, Phosphates, Potash, Magnesia.

Or, in other words, a ton of COD FISH and POTASH is composed, approximately, of—

Table with 2 columns: 10 cwt. of Dried Fish Flesh—Organic Matter, 4 .. of Dried Fish Bone—Phosphates, 3 .. Sulphate of Potash, 2 .. Sulphate of Magnesia, 1 .. of Moisture, and ingredients not of manurial value.

The Prices are £10 per Ton (bags included) for the COD, and £9 for the HERRING, on Rails in the Docks, subject to Discount for prompt Cash.

Retail Prices, Carriage Paid, upon receipt of P.O.O. IN TINS.—2 lb. for 1s; and 56 lb., 10s. 6d.

Apply to all our Nurserymen and Florists, or to J. JENSEN & CO., 10, ST. HELEN'S PLACE, LONDON, E.C.

REG TO ANNOUNCE THEY HAVE RECEIVED THEIR USUAL CONSIGNMENTS OF

THE ABOVE VALUABLE BULBS FOR EARLY FORCING,

And will be pleased to receive Orders for immediate delivery.

ROYAL EXOTIC NURSERY, KING'S ROAD, CHELSEA, LONDON, S.W.

NEW ORCHIDS,

Brought home by Mr. EDWARD WALLACE.

MR. J. C. STEVENS has received instructions from the NEW PLANT AND BULB COMPANY to SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY NEXT, July 29, at half-past 12 o'Clock precisely:—

A NEW CATTLEYA, collected in a fresh locality. The bulbs resemble somewhat those of *Trianea*, the flowers nearly as large but self-coloured, lips same colour as sepals and petals, with rich orange throat; many are pure white, others nearly so, very floriferous and fragrant—six to eight flowers were seen on one spike. Flowers after *C. Trianea* is over; from a cool locality among the mountains, about 3000 feet above sea level, and as easily grown as *C. Trianea*. Dried flowers will be shown.

A NEW EPIDENDRUM in the way of *E. Stamfordianum*, but different, and far finer. Has much broader and shorter leaves than that species, is more floriferous and richer coloured. Collected at an elevation of 1500 feet above sea level. Grows aloft in tufts on the trees. The spikes are emitted mostly in pairs from the base of the bulb, and were observed to descend 1 to 2 feet, with three to five branches, and large sprays of white or rosy-lilac flowers. Described by Mr. Wallace as a most beautiful sight. Dried flowers will be shown.

A NEW WHITE SOBRALIA-LIKE PLANT, with bunches of flowers looking on the mountain side like masses of snow. With dried flowers.

A WHITE BLETIA, found growing on the mountain slopes in grass and loamy soil. With dried flowers.

Also the following valuable plants, *GALEANDRA DIVES*, a yellow *CATASETUM*, a fine *SCHOMBURGKIA*, a grand new *TERRESTRIAL ORCHID*, with flowers 4 inches across, of a purple colour; and a few plants of *MASDEVALLIA PICTURATA*, the first established Plants offered for sale in Europe. *On view morning of Sale, and Catalogues had.*

FRIDAY NEXT.

CYPRIPEDIUM SANDERIANUM.

MESSRS. PROTHEROE AND MORRIS are instructed by Mr. F. SANDER to SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, E.C., on FRIDAY NEXT, July 30, at half-past 12 o'Clock precisely, a splendid lot of this remarkable and superb

NEW CYPRIPEDIUM—offered for the first time.

CYPRIPEDIUM SANDERIANUM is figured and fully described in the *Reichenbachia*. It stands by itself in its singular and quaint beauty, and is the only *Cypripedium*, besides *caudatum*, producing flowers with tails 18 and 20 inches long. It produces three flowers and more on the stem. The petals are very broad at the base, and of a reddish-purple, mottled with a light hue; the tail-like part is black-purple, and the tips are quite blunt, covered with thick hairs. The pouch is a dark brownish-red. It is altogether a showy remarkable, and fine new Orchid.

Professor REICHENBACH in describing it says:—"This is an extraordinary surprise as well as a great beauty, from the Malayan Archipelago. It is a great pleasure to dedicate this fine novelty to Mr. F. Sander."

On view morning of Sale, and Catalogues had.

THE

Gardeners' Chronicle.

SATURDAY, JULY 24, 1886.

MAX LEICHTLIN'S GARDEN.

AFTER a journey of two days from Haarlem, the next place at which I made a halt was Baden-Baden. It is the Mecca of all true gardeners, where plants and bulbs of the greatest interest are to be found. Of course all this centres in Herr Leichtlin's Botanischer Privat Garten. A more delightful situation could hardly be imagined than that which is occupied by him. The town is stretched out at his feet amid an amphitheatre of richly-wooded hills. In front are the Greek church and the villa of Prince Solms, besides many other residences of one kind and another. On the left he is flanked by the palace of the Grand Duke, and the ruins of a fine old castle are against the sky-line at the back. I have scarcely anywhere met with a prettier scene than this. If flowers have any sense of beauty themselves, they must be supremely happy in Herr Max Leichtlin's hands. It was difficult at first to realise that I had come to a spot of which I had heard so much before. How many envelopes of the brightest possible yellow have I not received from here! How many boxes or tinfuls of bulbs have been sent to me from here! How often have I received the best possible horticultural advice, and how in almost every garden of any note which I have visited (and the number has mounted up very considerably of late) has not Max Leichtlin's name appeared on label after label, and "grandiflora Leichtlini," or "Leichtlini macrantha," or something else of the same sort has been a certain passport to fame. From a bulbist's point of view this little spot of ground is the umbilicus of the world—for into it are poured in one continuous stream the treasures of Central Asia, of Persia, of Siberia, of the Himalayas, of Asia Minor, of the Cape, and of many other regions of botanical interest which are too numerous to be named. By a kind of force of attraction especially good thing when it first comes to light gravitates here before it travels elsewhere. Consuls in out-of-the-way parts of the world, soldiers, missionaries, ladies, doctors, adventurers, as well as professional collectors—all hand over any exceptionally interesting treasure which they may have found to the well-known gardener at Baden-Baden. But it does not follow from this that all plants and bulbs leave Herr Max Leichtlin's hands just as he found them. It is true he is not one of those professional hybridisers who like to carry a flower away from its own proper type as far as they can do it—who think they can so improve on Nature that they hide it and disfigure it altogether. He emphasises and deepens the true characteristics of a flower. In the first place, he knows what they are, and then by patient attention and selection he makes them more clear. As an example of this let me mention *Crocisma aurea macrantha*. It has not yet been sent out, but the whole stock is sold, and it will be one of the best autumn flowers of the future I am sure. Max Leichtlin showed me the different stages through which

this *Crocsmia* had passed. He has dried specimens of each and all of them, and it was most curious to note how improvement had followed upon improvement till now it can no longer be desired.

In the same sort of way who does not call to mind a certain *Freesia* which gladdens us in the spring?—and I think *Primula rosea* must bend its head before *Primula rosea grandiflora*, as it has come out of Herr Max Leichtlin's hands. There are many other instances that might be given of the same sort of thing. With Irises he has been conspicuously successful, and he looks for greater victories still; but what struck me first of all on entering his garden was a charming *Aubrietia* that was clinging to the wall. I know *Aubrietia græca*, and *A. Campbelli*, and several others, and I possess one which goes under the name of *A. erubescens*, and which flatters itself that it ought to be noticed because it is perhaps a little more red than blue. Really it is of no particular colour at all, but it does its best to be blushing, though with very indifferent success. Max Leichtlin's new *Aubrietia* is of a most captivating rosy-carmine hue that could be imagined; there is no mistake about it at all. The colour is attracting and pleasing in the highest degree, and while the plant still is an *Aubrietia* all over, it is very much better than anything else which I have ever seen before of the same sort. The magician informed me that it took him ten years to accomplish this feat. A life has not been lived for nothing which could do so much.

With the greatest possible kindness Herr Max Leichtlin has from time to time gone over his garden with me, and has shown to me his greenhouses, his seed-beds, and his frames. A garden like this requires an interpreter at every turn. It is by no means large, and though I believe some three or four acres are attached to the house, the inner sanctuary, where such wonderful things are done, is not more than three-quarters of an acre in extent. This is crammed full to overflowing, and not a square foot or even an inch of ground has been lost. The Privat Botanischer Garten lies open towards the south with perhaps a slight inclination to the east, and one of its features is that terraces rises above terraces—they are made upon a slope. This arrangement of terraces has its advantages and its defects. The rain sometimes comes down in torrents in these parts and washes the soil of one terrace over another, but they have a pretty effect, and the extent of available walls for creepers and of the shelter of tender things is largely increased by their means.

SOME OF THE CONTENTS OF THE GARDEN.

Among the most noticeable of plants and bulbs which were in blossom in May may be given the following:—*Iris paradoxa*, which I have never seen before, and which is excessively striking. It comes from the Caspian Sea, and in his own words it may be said "the claws are ochreous-yellow, speckled with small crimson spots; and the falls, which are attenuated and tongue-like, much resemble small pieces of black velvet." *Iris Korsolkowi* in its best form, was, to my great misfortune, just over. This must be a very great beauty indeed. When it is admittedly the finest of all the Irises, what more can be said of it? Max Leichtlin, to whom flowers are as the breath of his life, stops still in his garden to look at it. He is unable to pass it by. The colour—the veining—the whole contour of this *Iris*, are said to be incomparably good. A variety was in blossom of olive-green appearance, and with black markings on it. One might well have been contented with it if only it had been the best. *Polygonum sphaerophyllum*, of a pleasing red colour; *Androsace foliosa*, *Isxlorion macranthum*, *Eremurus robustus*, and *E. Bungei*, *Tropæolum brachyceras*, *Ethionema caudatum*, a new *Lachenalia*, which had the good points of *area* and of *Vancouveri pedicula* combined; *Polemonium grandiflorum*, *hexandra*, *Dracocephalum grandiflorum*, and very many more things, which are

too numerous to be named, were in blossom at the time of my visit, and were very attractive indeed. In most of these cases there was newness, and some special point had to be observed. *Polemonium grandiflorum* is of great size. *Isxlorion macranthum* is the best *Isxlorion* I have ever seen. *Ethionema caudatum* is pure white, and other notes of the same sort might be given about some of the rest. Even where a plant or bulb is not quite new, it often has a different look in this garden from what it assumes elsewhere, e.g., *Eremurus robustus* is by no means as good under one set of conditions as it can be under another. I never saw anything equal to the specimen of this glorious plant as it is in Max Leichtlin's hands. It has seemed to me sometimes to be rather overrated, but no one would say that for a moment who has ever beheld it in all its glory. As I looked upon it the other day it must always take first rank, and *Eremurus Bungei*, which is of a very clear yellow colour, is a most worthy companion for it, and sure to be very highly appreciated. A large bed of *Iris moræoides* should not be passed over without a word. It was quite at its best when I saw it, and it showed how differently flowers often look when grown in large quantities from what they do when only single specimens are obtained. Of plants and bulbs which have yet to grow into celebrity the number is legion. Here is a wonderful *Thistle*, *Cnicus* conspicuous, which will have a very large head of blossom of a bright red colour. There is a distinct *Arnebia*, of which outsiders are ignorant at present. An *Amaryllis* from China, which is said to be quite hardy, raises much expectation at once, and a shrub, *Lonicera Alberti*, promises great things, and will be wreathed in rosy blossoms before long. But to deal with the future would be an endless task in such a garden as this. I prophecy that the *Aubrietia* I have referred to above will be a wonderful favourite in villa gardens before long, and so also will many other things which are seen all packed together be exceedingly admired when they come to be distributed and properly planted out. A large frame full of *Tecophilæa* must have been a sight to see a few weeks ago in Max Leichtlin's garden, and when this comes to be better known, and specially because it appears to be quite hardy, no lover of flowers will ever be contented without it. There is one thing which is certainly a pity, and it ought to be remedied. I am told by Herr Max Leichtlin that very often he grows a large stock of some desirable plant or bulb, and it is altogether passed by on the other side. No one seems to care for it, no one notices it, and the whole lot of valuable things is then thrown away, and consigned to oblivion. Such a plant is *Dianthus pulcherrimus*, a little gem of only an inch or two in height. It was known and cared for in the distant past, then it was utterly lost to sight, and when it was accidentally rediscovered by Max Leichtlin a few years ago in an apothecary's garden on the Polish frontier it found no favour at all, and it soon passed into forgetfulness again. It is much to be deplored that such a thing as this should happen at all, but it does happen, I am told, over and over again. What in the world can our nurserymen be about to permit it? They are the channels through which these fine things should come into the hands of the community at large; they ought to be much more wide awake, I am sure. The loss of Herr Max Leichtlin's plants must be the loss of so much silver and gold to their coffers.

It must be a matter of some anxiety to carry on operations in such a garden as his. Who does not know how some favourite may be lost through an awkward turn of the water-pot? and too much shade or too much sun may work havoc at once; but, in our case there is no need for despair. Experience always must be bought at some cost, and a letter to the generous donor of a plant that has come to grief, or a few shillings spent for the second time at some nursery garden from which it was obtained, will very often put things right again for the future, and the worst that has happened is delay. But nothing of this sort takes effect at the Botanischer Privat Garten at Baden-Baden. To work there is something like playing with edged tools—you may cut your fingers before you think about it at all. All the nursery gardens in the world would fail to repair the loss of this or that very scarce and correspondingly precious plant or bulb if it should fail. Pounds instead of shillings will never bring it back if it goes. Only a few days before I arrived, the gardener who works under Max Leichtlin's eye, and who seems to be intent on his

business, mistook a flower for a weed, and *Incarvillea Oligæ compacta* went its way and disappeared from the scene. *Incarvillea Oligæ* is not uncommon, and we all know it very well, but *Incarvillea Oligæ compacta* is a very different thing, and a stranger to most of us. No careless gardening will do in a place like this—it would work havoc in a very short time indeed.

But if plants are lost in grievous and unexpected ways, I was glad to find that they sometimes hold their own, and are saved after the strangest adventures. The best *Gladolus* that Max Leichtlin has ever had—his favourite of favourites with that particular flower—was growing once in a bed of seedlings which he had occasion to move, and which were doomed to destruction, as he set no great value upon them. Ninety-nine, we may say, perished accordingly, but the hundredth was not so minded to die. It conquered bravely in the fierce struggle for existence which it had to endure, and its owner took pity on it when it reappeared the following spring, much to his surprise, and he let it live, merely because it stood out so well against adverse circumstances, and seemed unwilling to perish. The reward was this—a very singular and beautiful *Gladolus*, which in leaf and general habit differed from all others, and of which the blossom could not fail to be admired.

MR. MAX LEICHTLIN'S EXPERIENCES.

In addition to the great pleasure and profit of viewing his plants, there is an immense deal to be gained from discoursing with the master himself. I have seen him very often, and he most kindly gave me access at all times to his domains. The following may be taken as samples of the very valuable hints which dropped from his lips.

We were bending over a very large patch of *Omphalodes Lucilite*, and I said, "How do you propagate it? Do you grow it from seed?" The reply at once was, "There is just one fortnight in April which is good for increasing it, and if you manage to catch that one fortnight every little tiny bit of it will grow." What length of experience may have been wanted to find out this one all-important fortnight in the course of the year!—for he would not allow that outside of it there is the same chance of success.

Omphalodes Lucilite is very tractable for fourteen days, and for 351 days in the year, according to Herr Max Leichtlin, it is very capacious indeed. But my lesson did not by any manner of means end there. We passed on, and soon another great favourite, *Pulmonaria dahurica*, was reached. In my crass ignorance I said, "I shall try to find a fortnight for this *Pulmonaria* in the spring, after the way of *Omphalodes Lucilite*." "Then you will do no good with it at all," was the immediate reply, "for it only divides in the autumn."

It is the very quintessence of horticultural experience which Herr Max Leichtlin abounds, and what is so very important to other persons is, that he does not try to keep it to himself. Who has not admired *Nerines* and often failed with them if he has tried to grow them at all? But it makes all the difference in the way of encouragement if you know there are two sorts which stand out from all the rest in point of facility of culture, and other good properties which they possess. Begin with *Nerine excellens* and *N. pudica*, and let the troublesome *N. sarioensis* go its way. Over and over again the thought was uppermost in my mind, "Would only that my friend would write a book!" I have never felt this so strongly with regard to any one else. He has a manner of treating things, and a bold upon all minutiae which have to do with either plants or bulbs that seem to command success, and long patient trials have of course brought enlightenment with them. Max Leichtlin can now tread certainly where most other persons have still to feel their way. A book from him full of horticultural lore would be of priceless value to amateurs, and to those to whom progress is dear. I was much amused at hearing that exactly the same thing had already been suggested to him.

All along Max Leichtlin made me anxious to learn from him. It is true I went to Baden-Baden for that purpose, but the desire only deepened as it was fed. If I could not put back the hands upon the clock of Time, and I had nothing important to do, I should like nothing better than to serve an apprenticeship under him, and to enter fully into all the inner mysteries of his profession. But valuable as his suggestions certainly are from every point of view to the lover and cultivator of plants, it should be borne in mind that his example must not be servilely copied in every case.

It is right so far as it goes beyond all question and doubt, but he lives and works amidst surroundings which no English gardener can know. A lizard which almost runs across your hand and then stands motionless and stares you in the face reminds you that you are in rather a hot place. In the merry month of May the process of putting on and taking off the scrim coverings from his frames requires great attention and care. But who would see such a need for it in England at that early season of the year? And at midsummer the trouble is even greater to which he submits—the ground becomes so heated and baked by the fierce rays of the sun during the daytime that it does not answer at all to water in the evening, which is just the very time that our gardeners take for the purpose. Max Leichtlin rises at half-past three o'clock in the morning, and he then and then only deems it safe to water his favourites. In winter time he seems to suffer in the opposite way. He tells me that snow very frequently falls to the depth of half a foot in a night.

But the man must have his eyes closed to what is beautiful and his ears shut against all that is instructive in the way of gardening here who does not find a visit to Baden-Baden refreshing and useful in the very highest degree.

We all have to be thankful that there is one person who gives himself up so undividedly to the study of his choice, and who does it so well that his are no barren investigations, but they blossom and bear fruit abundantly. *A Wanderer.*

New Garden Plants.

ADIANTUM CAPILLUS-VENERIS VAR.
GRANDE, T. J.

THE remarkably handsome form of *Adiantum Capillus-Veneris*, of which a description is subjoined, was sent to us by the raiser some two years since, at which time it was not fully developed, and we advised its being grown on in the expectation that it would prove to be something noteworthy, and such it has proved to be, for it is not too much to say it is the finest and most noble of all the varieties of this species of Maidenhair.

The plant is of creeping habit, and soon develops a dense spreading tuft of its handsome fronds. These grow about a foot high, springing up from a creeping scaly rhizome, and have a black shining stipe of about 6 inches, and a triangular ovate lamina of the same length, made up of alternate spreading pinnae which consist of a few very large pinnules, the basal ones on the lowest pinnae being just sufficiently divided to render the fronds technically tripinnate. These pinnules are very peculiar, for when growing on the frond they appear to be solid, and one supposes they are large and undivided; when, however, they are gathered and placed between paper for the herbarium they appear to undergo some degree of shrinking without being reduced in their general bulk, for they are parted into from ten to a dozen dichotomously-divided segments, which are cut down fully two-thirds to the base, so that a frond laid in paper one day would scarcely be recognised the next. In both forms, the concrete and the divided, the fronds are particularly handsome. The pinnules, of which the larger ones measure fully an inch across, vary somewhat in form, some being half-circular in outline, some roundish-lanceolate, and some few cuneate, or occasionally more or less rhomboidal with the posterior line concave. The margin is in all cases deeply lobed, in a dichotomous manner, with a sorus occupying the apex of each lobe, and either oblong or linear in shape according to the breadth of the lobe on which it is produced; this is covered by a narrow indusium, which is regular or toothed at the margin. The rachides and pedicels are of a glossy black, like the stipes.

The fortunate raiser of this fine novelty is Mr. T. Jannock, of the Lily Nursery, Desingham, King's Lynn, who makes a specialty of the cultivation of the Lily of the Valley. He reports that he finds this Fern most useful as a decorative plant, and adds, "It is hardy, and will stand out-of-doors in sheltered places during the summer." It will grow in shallow pans or vessels of any description; the specimen sent to us—a very fine example of good cultivation, with quite a forest of vigorous fronds, was growing in a shallow pan some 1½ inch deep and 6 inches across, which was literally hidden from above by the mass of bright green fronds with which it was furnished.

Fronds 10 inches to a foot long (including stipes of 5–6 inches), evergreen, glabrous, triangular ovate, tripinnate; pinnae spreading, alternate, the lowermost slightly bipinnate; pinnules large, shortly and finely pedicellate, the larger ones fully an inch across, half-circular roundish flabellate or cuneate, the intermediate ones sometimes rhomboidal, with the posterior side recurved, all more or less deeply dichotomously lobate, the largest ones parted quite two-thirds to the base into 12–15 segments; veins flabellately forked; sori oblong or linear, occupying the apices of all the lobes; indusium narrow, irregular or toothed at the edge; rhizome creeping, covered with pointed dark brown scales; stipes, rachis, and pedicels glossy black. *T. Moore.*

LASTREA DILATATA VAR. DENTIGERA, n. nov.

This neat and pretty variety, unlike anything we find in our herbarium of British Ferns, is well worthy of record. It is almost symmetrical, the few variations in the two fronds before us consisting in one of them having two blank spaces where there should have been pinnae, the pinnae opposite one of these blanks being forked; and in the occurrence in the other frond of a group of three pairs of pinnae which are smaller than the normal size, are unequal in length, are set on askew, and are more crowded than usual. The fronds are dwarf (6–8 inches long), slender, lanceolate or narrowly ovate-lanceolate, the larger pinnae about 1½ inch in length, the pinnules ovate acute, quite distinct in the lower part, and more or less decurrent in the upper part of the frond; they are parted, according to their size, into from two to four lobes, which are again cut into one or two short acute teeth. This toothing being very even throughout the frond becomes a very conspicuous feature, and is intended to be indicated by the name adopted. The slender stipes and rachis are each furnished with small lanceolate scales, which are mostly recurved, and though *petite*, are large enough to show here and there the dark brown stripe which is one of the recognised marks of this species. The specimens here described were sent to us by the Countess of Ilchester, the plants, now growing at Melbury, having been found by her in August, 1855, near Loch Laggan, in Inverness-shire, at from 1500–2000 feet above the sea-level. In its minute toothing it perhaps comes nearest to *L. dilatata crosa* among the older forms, but that is much larger, and a more vigorous grower. *T. Moore.*

MASDEVALLIA STRIATELLA, n. sp.*

A small flowered *Masdevallia*, in the way of *Masdevallia chloracea* and *camptyliglossa*, with a closed perigone going out into three short tails, which are yellow, while the body of the perigone is white, with several (always nine?) cinnamon longitudinal stripes. Petals lanceolate, with an angle in the middle of the inferior side, white, with a brown mid-nerve. Lip lanceolate acute, with an angle on each side at the base, white, yellow at the base and apex, and with three longitudinal purple nerves. Column white, with purple side borders. The leaf is rather thick, cuneate, ligulate, blunt, acute, reaching 5 inches in length, not 1 in breadth. I had this nice little beauty through the kindness of Mr. W. Lee, Downside, Leatherhead. *H. G. Rehb. J.*

CHONDRORRHYNCHA LENDYANA, n. sp.†

Major A. C. Lendy, Sunbury House, Sunbury-on-Thames, Middlesex, has grown this for some years. Finally it has flowered, and has proved a chaste novel beauty. The flower is nearly as large as that of *Warsewiczella discolor*, but the petals are very large, and much superior to the sepals, the lateral ones

are reverse and retrorse, which produces a very peculiar impression; and the large elliptical lip has a small bidentate callus in the centre. Sepals and petals are of the lightest whitish-yellow, but the lip is much darker. The column is white with some small purple lines at the base in front. It is dedicated with great satisfaction to its excellent possessor. *H. G. Rehb. f.*

THE GENUS ODONTOGLOSSUM.

(Continued from p. 39.)

THE following form a very pretty section, many of them come under Lindley's division *lanthium*, and most of them bear branched panicles of rather narrow-petalled or comparatively small flowers. All are from high elevations, and all succeed best in the cold house, and with a liberal supply of rain-water. Many of this section are difficult to import and slow to come into regular flowering condition, but they are all very beautiful and free flowering even when once they get established. Many of them also partake more of the habit of growth of *Oncidium macranthum* than of the other sections of *Odontoglossum*, and they succeed well when grown in the same manner as the plant named.

ODONTOGLOSSUM AUROPURPUREUM, has large pear-shaped pseudobulbs, more or less erect leaves, the whole plant being of a light green; flowers about 2 inches across, of good substance; sepals and petals narrow, yellow marked with purple, borne on stiff much-branched upright panicles, often 5 feet in height. Peru; Venezuela.

O. REVOLUTUM.—Similar in habit to *O. Lindenii*, but with stiff leaves rolled back on either side of the midrib. Flowers yellow, borne on stout spikes in a dense pyramidal panicle.—Hartweg. Paramo of Guanacas, Popayan. Height, 11,000 feet.

O. LINDENII.—Habit of *O. auropurpureum*. Flowers on upright spikes, 2 to 3 feet, the upper half branched, each arm bearing several narrow-petalled flowers, wavy at the edge, of a clear yellow tint, and nearly 2 inches across.—New Grenada; 6000 feet.

O. SPATHACEUM.—Of this Lindley, in *Folia Orchidacea*, says:—"A noble plant, with large panicles of spotted flowers, apparently yellow, with sepals 1½ inch long. The bracts are much larger and more spathaceous than in the allied species." More recently received dried specimens prove the plant to be a very fine one, with golden-yellow flowers, sometimes marked with crimson spots. It is, however, very difficult to import, and but few of it have survived.—New Grenada.

O. PARDINUM, originally discovered by Dr. Jameson in the Andes of Ecuador at a height of 10,000 feet, and well flowered by Backhouse, of York, in 1857, has ovate compressed pseudobulbs and narrow acute leaves, all of a greyish-green. It bears narrow-petalled flowers on strong panicles, and the variation in the colouring is very great, some of the varieties being wholly yellow, some spotted, and some barred with reddish-brown. All are pretty and fragrant.

O. ANGUSTATUM.—This is a very elegant plant, with narrow pyriform pseudobulbs, each bearing one leaf. The flowers are on erect branched panicles. Sepals narrow, greenish-yellow with a line of brown in the middle. Petals broader and wavy at the edge, yellow with brown bars.—Peru, in the valley of the Lloa; height 8000 feet.

O. CLAVICES.—This curious species has large twiggy branched panicles of flowers, reminding one of *Oncidium phymatocilium*. The narrow wavy petals and sepals are cinnamon, barred with darker brown, the lateral sepals being under the labellum.—Ecuador.

O. RAMOSISSIMUM.—This, although known for many years, is not yet plentiful in collections. The pseudobulbs are oval and compressed, leaves long, narrow, and pointed. Flowers on upright, much branched panicles, sometimes almost wholly pure white, in others tinged with lilac, and in some, of the forms white, profusely spotted with purple; lip purple at the front portion. The late Mr. Roez mentions having found it at Manizal, Columbia, at 12,000–13,000 feet, where it is often subjected to frost.

O. EDWARDII.—Plentifully sent from Ecuador about 1878 by Edward Klappach, after whom it was named. It is a fine and distinct species, with stout dark green pseudobulbs and strong panicles of violet-coloured

* *Masdevallia striatella*, n. sp.—*AF.* *Masdevallia chloracea*, Rehb. f., ac *M. camptyliglossa*, Rehb. f.: foliis cuneato oblongo ligulatis obtuse acutis pedunculis subrevioribus floribus solitariis porrectis; ovaris pedicellatis bracteis excedentibus; mentis in sepalorum tubo minuto; caudis crassis tubum ipsum non exsertantibus; tepalis lanceatis infra angulatis; labello basi utrinque angulato lanceo, columna clavata apice acuta. Sepala alba nervis, cinnamomeis, caudis auranticeis. Tepala alba nervis medianis brunnea. Labellum basi apice flavum nervis teris perispermis. Columna alba purpureo marginata. *Cult. d. Lee, H. G. Rehb. J.*

† *Chondrorrhyncha Lendyana*, n. sp.—Sepala impari ligulato obovato ovata, lobis ellipticis, linearis ligulatis reversis retrorsis; tepalis oblongis, labello elliptico antromum obscurem subrenatulo, callo depresso bidentato in disco, rostellulo producto tridentato. Sepala pallidissime ochroleuca. Petala distincta coloris. Labellum cereum magis antice pollidius. Columna alba striata in basi purpurea. *Exc. Lendy Sunburyensis, culta, H. G. Rehb. J.*

flowers, each about an inch across. It is also very fragrant.

O. IOPLOCON resembles a plant intermediate between *O. ramosissimum* and *O. Edwardii*, both of which it resembles in some of its features. Flowers mauve, the wavy segments being broader and shorter than those of *O. ramosissimum*. It flowered with Mr. Bull, of Chelsea.

O. LILIFLORUM.—Under this name a very charming plant was exhibited at a recent meeting of the Royal Horticultural Society. It bears a resemblance to *O. Ioplocon*, but is much stronger growing if Mr. Fuchan's plant fairly represents it. It has since been imported and sold under the name *O. liliflorum*, and thus the name is established in gardens. It bears stout flower-spikes 3 to 4 feet in length, naked for two-thirds of the length, and bearing at the top a dense head of rose-coloured flowers, each over an inch across, the segments being broader and shorter than *O. ramosissimum*. *James O'Brien*.

ACORN GALLS.

THE inquiry in a recent issue of the *Gardeners' Chronicle* as to the origin of "cocones in an acorn at Cannes," furnishes a convenient opportunity for a brief sketch of what is known of this interesting phenomenon. From the description given I have little doubt that these so-called cocones are true galls, and probably produced by a small gall-making Cynips known as *Andricus glandium*, or a closely allied species. Mayr, in his *Die Mitteleuropäischen Eichen-gallen*, in describing the acorn-galls of *Andricus glandium*, says:—"If we cut through the fallen acorns of the Turkey Oak in autumn, we often find in their interior a remarkable thickening of the brown shell, which takes the place of part of the nut, and in section show white, hard, oviform, or polyhedral inner galls of about the size of a Hemp-seed. They are joined together with slightly dense tissue, and in each there lies a gall-fly larva. Sometimes we find the acorn-shell only thickened by a single gall at a place, but sometimes the seed is wholly appropriated, and the whole acorn filled with these galls." He further remarks that the fly was not bred until the third year after the galls were gathered. The above translation, by Mr. E. A. Fitch, together with other information, may be found in the *Entomologist* for 1878.

Before considering how far the description of the cocones found at Cannes agrees with the above, we may mention what is known of acorn-galls in Britain, as we shall see it has a distinct bearing on the question. In the autumn of 1874 Mr. G. B. Rothera collected at Oller-ton, Nottinghamshire, an acorn-gall which he describes as a thin, shelly, unilocular gall, lying loosely within the acorn-case, and containing a large, fat, white, manduculate larva, closely resembling that of *Cynips Kollarii*, the maker of the well-known bullet-gall. He remarks that it does not agree with the one figured by Mayr, nor with Giraud's description, which applies to a multilocular gall.

In the early summer of 1875 Mr. Cameron collected near Glasgow two or three galls which he referred to this species. As they were, however, from the common Oak, as were presumably the Notts specimens, it is very doubtful if they belong to *A. glandium*, which has only yet been certainly bred from the Turkey Oak. And what renders the suspicion that they are produced by a distinct species the more certain is the fact that of the numerous European galls now known, none are common to these two species of Oak.

In the autumn of 1877 Miss E. A. Ormerod discovered at Kew acorn-galls on the true Turkey Oak, *Q. Cerris*, and its variety, *Lucombeana*. These I have little doubt are really produced by *A. glandium*. They are common at Kew every autumn, though I have not yet succeeded in breeding the insect. The chief difference between the two consists in the more dwarfed state of the acorn in English than in South European specimens, though this would hardly denote a specific difference if unaccompanied by any other, and possibly may be due to our less favourable climate. Now comes an interesting point. Miss Ormerod, in the spring of the previous year, had found a bud-gall on the same Oak which yielded the acorn-galls in the autumn, and on forwarding specimens to Herr von Schlechtendal, he gave the opinion that they corresponded to the bud-galls of *Andricus circularis* of Mayr. Miss Ormerod then threw out the

suggestion that further search might possibly show these two galls to be the spring and autumn forms of the same species, as is now so well known in the case of the common Oak. Whether this is really the case is a problem which I believe yet awaits a solution.

This dimorphism in galls is an extremely interesting and even remarkable fact, for the two forms have hitherto been usually placed in distinct genera. If acceptable I may possibly return to this at some future date; in the meantime it would materially help in the solution of the question as to the maker of the cocones found at Cannes if Mr. W. Marshall could inform me if the acorns were those of the Turkey Oak or of the common species, and, still better, if he would kindly forward me specimens, on some future occasion, for identification, and to enable me to breed the maker, if possible. *R. A. Rolfe, Herbarium, Kew*.

Orchid Notes and gleanings.

HEMIPILIA CALOPHYLLA.

THIS is an interesting and very beautiful addition to the genera of Orchids now cultivated at Kew. It was in flower there till a few days ago, when, a figure of it having been made, the spike was secured and carefully dried for the Herbarium. It is well described by Professor Reichenbach, as follows:—"The leaf is dark green, very beautifully mottled and netted with brown, and equals that of the common *Hemipilia cordifolia*, Lindl., as does the whole plant. The elegant flowers are white, with green tips to the sepals and petals; the lip is purplish, and, according to a note of the Rev. C. Parish, flowers wholly purplish occur." The plant was detected on limestone rocks near Noulmein, in August, 1873, by the Rev. C. Parish who forwarded to Professor Reichenbach a drawing, and a specimen with an eight-flowered spike. In habit it resembles a *Goodyera* or *Anacrotichilus*, except that it has the peculiarity of producing only a single leaf. *R. A. R.*

DENDROBIUM BREVIFLORUM, Lindl.

This long lost, though by no means showy *Dendrobium*, has again turned up, a specimen, received from the Calcutta Botanic Garden, being now in flower at Kew. It was described by Lindley in 1859, with the information that it flowered in 1844, in the nursery of the Messrs. Loddiges; the wild locality being doubtfully given as Singapore. A coloured drawing at Kew, received from the Calcutta Botanic Garden, however, states that the plant was introduced there from Parasnath, in the Indian province of Behar—a much more likely locality. The flowers, which are half an inch in diameter, are borne in fascicles on pseudobulbs of the previous year. The sepals and petals are pale greenish-white, with crimson spots arranged somewhat in longitudinal stripes. The lip is three-lobed; the broad central lobe yellow in colour, and the falcate acute side-lobes crimson. The column is creamy-white, with a crimson border round the stigma. Lindley's herbarium contains a well executed coloured drawing of the flower, a portion of a pseudobulb, and a fascicle of flowers. *R. A. Rolfe, Kew*.

SOME ORCHIDS IN FLOWER AT MESSRS. J. VEITCH & SON'S.

The large Cattleya-house still contains a good number of plants in flower, but we could perceive the season was fast drawing to a close, and a week or so of hot weather will dispose of the remainder of the harvest of bloom that has now lasted since the beginning of the year. A few *Cattleya Sanderiana*, in which considerable diversity of colour and some also in size of bloom were noticed; the cheerful-looking *C. crispata*, a few richly-coloured *C. Dowiana*, and *C. elegans*; *Lælia elegans*, always so capital a contrast in its pure white to the high-coloured species; and several of the lesser known *Lælia xanthina*, with flowers of white and pale yellow. Of the charming species *C. guttata* Leopoldi there were several plants bearing robust spikes of eight or ten blooms each, distinct from everything else by the richness of their tints.

In other houses were *Angraecum Scottianum*, a pretty diminutive species, pure white, the tail measuring 6 inches in length; the very varied as to colour *Oncidium Jonesianum*; *Dendrobium endocharis*,

one of Mr. Seden's hybrids, with terete pseudobulbs and white flowers, *Mignonette*-scented; and *D. Rhodostoma*, a small flower, with the colours common to *D. nobilis*.

CATTELEYA GIGAS.

This species has done very well this season in the gardens of De B. Crawshaw, Esq., Rosefield, Sevenoaks. It is certainly one of the finest of the genus, and grows freely enough, but is very shy in flowering. If the plants are potted in the same way as *C. Mossiae*, *C. Mendelii*, *C. Trianae*, &c., and placed on a stage, they will probably remain flowerless. I have grown it the best in blocks suspended near the roof. Mr. Cooke, the gardener, has placed his plants in pans and baskets, and hung them up near the roof. Nearly the whole of the growths have produced flowers out of a considerable number of plants. It likes a warm temperature when making its growth. *J. Douglas*.

SPATHOGLOTTIS ANGSTURUM.

From the *Compagnie Continentale* of Ghent we have received a cut spike of the singular and beautiful plant described by Professor Reichenbach in *Gardeners' Chronicle*, vol. xxv., p. 334, and figured in the *Livulenia*, t. 25. The flowers are borne in close many-flowered terminal racemes, each flower springing from a white boat-shaped, eventually reflexed, bract. The slender erect pedicels measure about an inch in length, and pass imperceptibly into the ovary, which is linear, untwisted, and of about the same length as the pedicel. The individual flowers are about $1\frac{1}{2}$ inch in diameter, white, flushed with lilac; the three sepals broad at the base, oblong-acute, concave, the side petals of a similar colour, but broader and tapering at the base; the lip is shorter than the petals, and of singular construction: the basal portion has on each side a lobe of falcate oblong obtuse form, and of a purplish-brown colour, finely spotted, ascending and arching over the central callus, which has a median groove, bounded on either side by a thick wedge-shaped process, flat at the top, and provided with a few hairs; at the base of this callus, on either side, are two small ear-shaped processes, while in front of them the lip runs out into a long slender stalk or unguis, pointed in the middle, and dilating in front into a petaloid transversely oblong, two-lobed violet-coloured limb. The column is about half the length of the petals, club-shaped, white, arching over the side lobes of the lip. *Polinia* eight, with long stalks.

We do not know directly by what means the flowers get fertilised, but the inference to be drawn from the structure is highly curious. It will be seen from what has been before said that there is a well-marked tunnel in front of the base of the column, a tunnel formed by the side lobes of the lip which form the sides and roof, while the floor is formed by the deeply-grooved callus or wart. In front of this is the lip with its long stalk jointed in the middle, and terminating in a petal-like expansion. We imagine from this structure that an insect alighting on the fore part of the lip crawls along the tunnel at the base to get at the honey. Having entered the tunnel the door, which at first stood invitingly open, is closed behind him by the action of the hinge in the stalk of the lip. The lip, in fact, which was at first in a straight line becomes, probably by the impact of the insect exciting the movement, suddenly bent at right angles, thus more or less effectually closing the tunnel, or at any rate detaining the insect, which in its struggles to free itself from the trap must infallibly dislodge the pollen masses. *M. T. M.*

AZALEA OCCIDENTALIS.

THE word *Azalea* offers a difficulty in nomenclature. Botanists have ascertained that between *Rhododendrons* and *Azaleas* there are no absolute limitations—that while a *Rhododendron* proper and an *Azalea* proper are amply distinct, there are intermediates which do not fit precisely into one or the other, and consequently from their point of view there is but one genus, of which *Azalea* is a mere subdivision. From a garden point of view, however, *Azaleas* are not *Rhododendrons*, nor are *Rhododendrons* *Azaleas*—the intermediates are unknown or ignored, and custom has become too potent to allow of any change in garden nomenclature. So long as it is understood what is meant it really is not of much consequence; and under these circumstances we prefer to stick to the garden nomenclature, and call this plant *Azalea occidentalis*. Botanically it is *Rhododendron* (section *Azalea*) *occidentale*.

Azalea calendulacea has long been known from the Eastern or Atlantic States, and the present species from California is in the dried state so like the older-known plant, that it is no wonder that it was thought they were identical. Nevertheless, the Pacific plant is amply different when seen in the fresh, and so, instead of one species common to both sides of the American continent we have two—one peculiar to the South Atlantic States, the other to the West or Pacific States. Whether or no they origi-

This, and the illustration (fig. 21), preclude the necessity for giving further botanical detail. Its garden history is that it was introduced to the Veitchian nursery at Exeter, many years ago, by Mr. W. Lobb, and it was from this source that Sir W. Hooker's figure was taken. From the same source, probably, were derived the bushes in the Kew Arboretum; little, however, has been heard or thought of the plant till recently. Just as we were thinking *Azaleas* were nearly over, Mr. Anthony Waterer brought up to South Kensington trusses of this *Azalea*,

the community are due to Mr. Waterer for once more bringing this under notice.

SCOTCH NOTES.

THE TWEED VINEYARD, CLOVENFORDS.—It is nearly eight years since we had the pleasure of looking over this famous Grape-growing establishment.

FIG. 21.—AZALEA OCCIDENTALIS: FLOWERS ORANGE AND CRIMSON, FRAGRANT.

nated in some remote past from one common stock no one can say; probably they did, but the pedigree is not forthcoming, and we must now take them for what they are—two distinct species.

A. occidentalis is a native of the Sierra Nevada, and of the coast range along streams. It is fully described in the *Botany of California*, vol. i., and in Gray's *Synoptical Flora of North America*, vol. ii., part I (1878), p. 40, having been previously described from imperfect materials by Torrey and Gray, and by the late Sir W. Hooker, who figured it in the *Botanical Magazine*, t. 5005.

which attracted great attention from the season at which they were shown, as well as from the beauty and fragrance of their flowers. The flowers are each about 2 inches long, the tube 1 inch, cylindrical-funnel-shaped, deep rosy-red and shining, though not so thickly beset with glandular hairs as *A. calendulacea*, in which also the tube is more slender. The leaves, too, are bright shining green, assuming, we are told, a glowing red colour in autumn. At the margins they are bristly, but not serrulate as they are shown in the woodcut. For the rest our illustration, taken from Mr. Waterer's specimen, tells its own tale. Anything which will prolong the *Azalea* season is welcome, and this has so many good points in addition that the thanks of

Many changes have taken place since then in the horticultural world, short though the time be—few of them for the better, many for the worse, whether the view be taken from the commercial, the social, or the domestic standpoint. There have been changes in this great place also, as we noticed on the occasion of a recent visit, but they are of such a nature as to increase rather than diminish the interest of the visitor, while they undoubtedly add to the profit of the proprietors. Perhaps the most notable change in recent years is the discarding of the market plant trade and the substitution of Orchid growing instead.

THE ORCHIDS.

The suites of houses formerly devoted to the cultivation of thousands of the usual classes of market plants are now filled with valuable Orchids. The collection consists only of the best species and varieties obtainable—nothing inferior of its kind is grown, and the genera selected from include all that are popular at the present time. The condition of the stock is exceptionally good, the plants clean, vigorous, and well established. Of rare kinds we noted fine plants of *Anguloa eburnea* (true) and *A. Ruckeriana* in flower, both especially alike in growth, but totally distinct in colour, the former pure ivory-white and spotless, the latter deep bronz crimson, and both as interesting as they are rarely seen. Some fine forms of *Odontoglossum citrosimum* were flowering freely, and several splendid plants of *Dendrobium suavisimum* were profusely covered with their thyrses of lovely flowers. Among *Cattleyas* we noted a goodly number of *G. Gaskelliana* in flower, which, if not one of the best of the genus, is certainly a most useful one, inasmuch as it extends the possible season of *Cattleya* blooming to a period long after that in which the other sections of the genus have ceased to flower. *Cyripedium ciliolare*, as seen here, is a very distinct and desirable species. Why such a beautiful and free-blooming sort should have made so little impression on Orchid growers at the time of its introduction is difficult to conceive. It is unquestionably one of the finest and most distinct of the section of the *Lady's Slipper* family, to which it belongs. There were some admirably healthy specimens of *C. Dominianum* in bloom, and a magnificent specimen of *C. Stonei* in a 20-inch pot that was formerly in the collection of the late Mr. Sam Mendel in his most glorious horticultural days. Some very healthy plants of *Phalenopsis Ludemanniana* were flowering freely in baskets; and the dwarf and best form of *Sobralia macrantha* was showing a profusion of its always attractive blooms. The most noticeable of rare species and varieties not in flower were vigorous plants of *Laelia Jonghiana*, with from seven to nine bulbs; *Dendrobium nobile nobiliss.*, fine young stock, in fine growth; *Laelia Amara*, *Cattleya Skinneri* alba, *C. exoniensis*, *Laelia anceps* alba, *Coelogyne Massangana*, *C. cristata* (Chatsworth variety)—of the latter a large stock propagated from original plants; *Dendrobium Leechianum*, a fine batch of young plants; and *Odontoglossum Pescatorei* Thomsoni, a very superior form of this popular species. The stock of *Masdevallias* and *Odontoglossums*, containing only the best varieties of all that are worth growing, is all well established, and being propagated at home—not imported—are to be depended upon as to the character of each individual plant. There were a good many plants of *Odontoglossum Alexandre*, and a few of *O. Pescatorei*, in bloom, all showing distinctiveness and purity of colouring. Several strong tufts of *Masdevallia chimera* were the only samples of that genus in flower.

THE VINERIES.

A look through the vineries was very gratifying. We have often had the pleasure of inspecting them since they were first planted some sixteen or seventeen years ago, but have never seen the Vines more heavily cropped or in better health than on this occasion. The *Lady Downe's* houses are simply grand, the crop enormous, the bunches large, almost uniform in size from top to bottom of the long rafters, averaging 2500 in each house. Viewed from an end of the house, the crop appears to be a solid mass of noble bunches and berries. The Gros Colmar houses are even more remarkable for the excessive weight of the crop they contain. The bunches are somewhat fewer perhaps per Vine, but the enormous size of the berries, which in the earliest house are just beginning to colour, and the greater bulk of the bunches combine to give an appearance of greater weight than is suggested by the view of the *Lady Downe's* crop.

These two Vines with *Muscad* of *Alexandria* form the bulk of the crop now grown at Clovenfords. The two first are the favourites in the market, they take more readily by the public than any other sorts. They keep better, and carry with much less risk of damage to distant markets, and as these are the chief or rather the only outlets for such masses of the best qualities of grapes as are annually produced here, the selection of sorts and other arrangements are all made by the proprietors with the view of meeting the requirements of their trade. Very little from Clovenfords finds its way into Scotch markets, consequently only sorts that will carry and keep well are grown.

For this reason we regretted to observe that the space devoted to the growth of the Duke of Buccleuch is very much restricted as compared with what it was formerly. This is not a good keeping Grape, nor is it a good traveller. Its thin skin, its slender footstalks, and its enormous weight, all unsuit it for either keeping long or travelling well. But provided there is a ready market near at hand, Messrs. Thomson are still of opinion that the "Duke" is one of the best and most profitable to grow for market purposes. No variety is more in favour with retail dealers or consumers of Grapes, and it is with regret that Messrs. Thomson find themselves compelled, for the reasons above stated, to limit their own growth of it.

The most astonishing fact that came to our knowledge in connection with the Vines at Clovenfords on this occasion, was that the use of farmyard or stable manure had been wholly discontinued during the last three or four years; it is not even used in the way of mulchings. Grass mown from the roadsides in the neighbourhood, is the only material used for mulching, and that only on inside borders to moderate evaporation, and to prevent the raising of dust by the passage of the numerous visitors through the houses. Nothing in the shape of nutrient or stimulant has been given to these Vines during the time stated above, except the "Improved" Vine manure, manufactured by Messrs. Thomson themselves. Prior to that time they were treated to stable manure collected for them in, and hauled at great cost from Glashiels, a distance of 3 miles, but the exhausted soil did not respond to such applications, and the Vines decreased in vigour, shanking set in, and it became evident that a change of treatment must be adopted or disaster would ensue. Many experiments had been instituted prior to this time with the various artificial manures that are in the market, some of which proved perfectly satisfactory, as mere stimulants during the periods of growth, but were deficient in the staying qualities requisite to the reinvigoration of worn out plants such as the Vine by accretion. The result was the concealing of their own special manure, originally only for their own purposes, and which the public now have the advantage of, but not before Messrs. Thomson had proven by their own experience that it was all they desired to meet the requirements of their own case. Their Vines have improved steadily since they changed their treatment as regards manure, and if results mean anything in such a matter they are eloquent at Clovenfords in favour of the new treatment. As regards the actual cost relatively of the artificial and the natural manures, Mr. W. Thomson, sen., considers the firm are over £100 annually in pocket by the change, the larger portion of which sum was due to the labour attendant on the use of the latter. Cleanliness and the absence of unsightly litter are points of perhaps secondary consideration to growers for market generally, but not so at Clovenfords, where everything is kept in spick and-span order, and there is evident economy in any case in the maintenance of such conditions. X.

TREES AND SHRUBS.

RETINOSPORA TRITRAGONA AUREA.

Messrs. W. BARRON & SON, of Borrowash, showed at Liverpool a fine specimen of this compact growing Conifer, which has the great advantage, we were told, of doing well in the colliery districts, where it is exposed not only to foul air, but to strong wind. We do not know the source of this fine golden variety.

ARIES DOUGLASHI GLAUCA.

This handsome variety is, we learn on the authority of Messrs. Barron, who showed a fine plant at Liverpool, harder than the common form and that from Vancouver Island, and less liable to be hurt by spring frost.

ZENOBIA SPECIOSA.

The most experienced botanists seem to be in accord in considering that there is but one species of this genus (by some considered a section of *Andromeda*), and that species, moreover, very variable. Asa Gray says that it varies from bright green to chalky white (*Synoptical Flora of North America*, p. 30). For garden purposes, however, it is well to keep the varieties distinct. The variety *pulverulenta*, figured by us at p. 109, *Gardeners' Chronicle*, vol. xx., has oblong obtuse leaves, markedly crenate, and very

glaucous. The pedicels, arranged in umbels along the ends of the branches, are about three-quarters of an inch long, and the drooping flowers measure rather over a quarter of an inch in length, and are bell-shaped, or somewhat funnel-shaped, not distended, in the middle.

ANDROMEDA CASSINIFOLIA.

Of which a specimen has been kindly sent us from Combe Wood by Messrs. Veitch, is even more beautiful, so far as the flowers are concerned. The young shoots are somewhat angular, and bear shortly-stalked, ovate-oblong, finely-venate, not crenate, rather thick green leaves, the colour of which is set off by the red tint of the shoot-stalks. The flowers are like those of a Lily of the Valley on a large scale, bell-shaped, distended in the middle, and arranged in tufts or umbels on alternate sides of the shoot for a length of 4 or 5 inches. Both forms are strikingly handsome, and so hardy that one wonders not to see them more frequently.

HYDRANGEA INVOLUCRATA.

From Messrs. Veitch we have received, from their rich stores at Combe Wood, flowering specimens of *Hydrangea involucrata* vera, a plant with the stems and foliage more or less covered with stout bristly hairs, the leaves shortly stalked, lanceolate, finely toothed, and with prominent nerves. The two uppermost leaves or bracts are much smaller than the others, boat-shaped, and forming an involucre to the cyme of pretty blue flowers. The species is Japanese, and not often met with.

NOTOSPARTIUM CARMICHAELIÆ.

is a pretty and interesting shrub, with stems like those of the Spanish Broom, and with scale-like leaves only. From the sides of the flattened branches issue short racemes of pale violet pex-shaped flowers. It is a native of New Zealand. Messrs. Veitch.

STYRAX JAPONICUM.

A shrub with slender wiry branches, small thin ovate acute leaves, tapering into a short stalk. The flowers are borne on the shoots of the year, and have long slender pendulous stalks. The flowers themselves are bell-shaped, white, five-petalled.

CHOISYA TERNATA.

Mr. R. Greenfield, at p. 767, makes enquiries respecting this plant which he had noted at Kew some six years ago. Until quite recently there were two plants, which would correspond to what he mentions, and as he did not specify on what aspect it was planted, nor in what particular part of the garden he saw it, one could not be certain which he meant. One enjoyed the protection of a wall on the southern aspect, growing and flowering freely without the slightest protection until it was removed recently owing to some alterations that were being made. Another plant which I believe had been planted about the same date occupies an eastern aspect on the herbaceous ground wall, where it produces annually a great quantity of Orange-like blossom in many-flowered umbels. About three years ago some large branches of this plant suddenly died through some unaccountable cause, as frost had evidently nothing to do with it; but the remainder of the plant assumed its wonted vigour, and to-day it covers by a rough computation an area of 600 square feet, or 10 in height by 6 in breadth. It suffers no systematic pruning, and the leading branches only are nailed to the wall, so that an unbroken surface of foliage covers the wall, which doubtless assists the plant in severe weather. The power of resisting cold, however, possessed by this plant should induce gardeners to plant this shrub on a much greater scale than has hitherto been done in the open air. A figure of it is given in the *Gardeners' Chronicle*, vol. xiii., n.s., 1880, p. 625, J. F.

STATISTICS OF HARVESTS AND THE METEOROLOGICAL PHENOMENA. — C. Ferrari has published in the *Agricultural Annals* for 1883 a comparison for Italy between the statistics of harvests and the meteorological phenomena. He deduces a number of practical rules, such as the more rain we have in summer the greater the harvest of corn [Maize]; but for Wheat, Rye, and other grains, great rain frequency is injurious, and the harvest is greater as the temperature is higher and the cloudiness less.

REPORT ON THE CONDITION OF THE FRUIT CROPS.

CONDITION OF THE FRUIT CROPS—(Continued.)

THE CARNATION GROUND AT MESSRS. J. VEITCH AND SONS.

COLD days and colder nights in early summer, and the general unfavourable climatic conditions of the present season, hindered the proper development of most varieties of Carnations and Picotees, the "grass" being anything but abundant, and the flowering season nearly a fortnight later than usual. London air prevents, in the most favourable years, any attempts at the culture of many flowers, both those strictly of the florists' type as well as others equally desirable; but the Carnation, the Pink, and the Picotee are all in about an equal degree proof against its malignity, as is proved by many a pot-grown flower on window-sills in the decess part of town, and by the really fine show made with the Clove Carnation and others in the Embankment gardens, near Charing Cross.

But to return to our Chelsea flowers. Here space is not so confined with houses, and factories are a good way off. Some fine varieties were found in bloom or coming into bloom, which many a gardener in country places would highly prize in his borders. These are nearly all "border" flowers that we find here, and are mostly such as are good doers, as under-

stood by the craft; not but that most of the show varieties—which by the way are not grown at Chelsea—will grow and flower in the open border under good treatment. Of sorts excellent for beds where plants are liked that do not reach a great height may be mentioned C. The Bride (Hodges), a fine bold regular flower, pure white, grows well and lasts long in flower; C. Burnett, nearly new, of a cerise colour, with abundant grass and bloom, and of a dwarf stocky habit; C. W. P. Milner is another fine bedder, reaching to a height of 20 inches, the flowers being white and very full in form; C. Royal Purple is also fine for beds; it has abundant foliage, is robust in constitution, and is of a pleasing shade of colour; in bedders nothing can excel C. Magnum Bonum for compactness of growth, abundance of bloom and colour, which is a brilliant scarlet. Newer, and slightly taller growers are C. Brilliant (new), an abundant flowerer, of a purplish-cerise tint; C. Celia, a lovely pink flower, tolerably well known, a tall and strong grower; C. Florence, a buff-coloured self, the bloom full and large; C. Earl of Wilton, a good crimson flake; C. Ajax, a purple flake; C. Masterpiece (new), a rich crimson

self, of very fine quality; C. Walter Ware, a fancy variety, buff ground, with scarlet stripes; C. General Stewart, a very dark crimson self, carrying abundance of bloom; C. Earl of Beaconsfield, a dark shade of the same colour, with still darker stripes, a splendid flower; C. Countess of Ellesmere, a fancy, spotted minutely with crimson on a pale pink ground; this is an old but very pretty variety. C. Beauty of Whithy is a fine scarlet flower, excellent in all points as a border kind; as are also C. Dora Williamson, white; C. Beauty of Boston, deep rose—one of the best of that colour; C. Brigadier, a scarlet flower, of a medium size and dwarfish habit; and C. Queen of Roses.

The Picotees were coming into bloom in large numbers, both old and new kinds. Two of the finest were observed in P. grandiflora, a heavily barred flower; and P. Goldfinger, a medium grower, the flower having a yellow ground.

Pink Rose Perfection is a late flowerer, a robust grower, and is a true Pink, being a sport from one of the laced varieties; as an edging Pink this would be excellent. Pink Abbotsfordiana, a purple-rose, is likewise a meritorious variety. *M.*

APPOINTMENTS FOR THE ENSUING WEEK.

		Royal Horticultural Society: Meeting of the Fruit and Floral Committee, at 1 P.M.; Scientific Committee, at 1 P.M.; Show of the National Ornithology and Icthyo-Scientific (Southern Section)
TUESDAY, July 27		Sale of Imported Violets for night home by Mr. E. Wallace, of Colchester, at Stevens' Rooms
WEDNESDAY, July 28		Sale of Flowering Orchids, at Frotherie & Morris' Rooms
		Clearance sale of Plants, Greenhouses, &c., at the late Mr. Boler's Nursery, Harrow Road, W., by Frotherie & Morris
THURSDAY, July 30		Wild Horticultural Society's Show at Salisbury (two days)
FRIDAY, July 31		Sale of Orchids, by order of Mr. F. Sander, at Frotherie & Morris' Rooms
SATURDAY, July 31		Southampton Horticultural Society's Show, at the Royal and Horticultural Society's Show (and on Monday, August 2)

THE reports which we are enabled, by the courtesy of our correspondents, to give in this issue as to the general state of the FRUIT CROPS in Great Britain, are, if not entirely satisfactory, at least of much interest. It must be borne in mind that they are supplied from all parts of the country by experienced observers, who have for the most part been in the habit of supplying this kind of information for several years, from the same localities all over the country; and if they cannot be relied on to afford mathematically exact evidence they at least give a thoroughly impartial general statement. The evidence applies to some crops that are past, and to others that are as yet prospective. They are of interest, especially if compared with similar evidence for the last quarter of a century, as affording some criterion as to the probable value of fruit-growing as one remedy for the depression in agriculture; and they must also be considered from this point of view with the details obtained from a study of the exhibits from week to week at the Colonial Exhibition from our several colonies, and more especially from the territories of Canada and the United States. Looked at from these points of view we cannot say the record is reassuring for the home-grower. Fruit culture in this country is as uncertain as are the Wheat crops, and, when all things are considered, from much the same general causes.

The fruit crops generally this year may be written off as a failure, but the exception—small fruits—is significant. Small fruits come in early; they defy foreign competition in the matter of carriage, and even Strawberries, which travel as badly as things of that kind can travel, have probably yielded a profit, even though the aggregate crop, as appears from our reports, has been deficient. Our Apple crop, which, on the whole, is the most commercially important, is under average, while our American and Canadian advices seem to show that in those countries the crop will be a fair average. We know what this means. In a few months thousands upon thousands of barrels will pour into our markets from the other side of the Atlantic, while the experience of the last few years, and the indications of the Colonial Market at South Kensington go to show that from such far-off localities as the Cape of Good Hope and the southernmost Australian colonies fruit of excellent quality may be expected to arrive in first-rate condition at seasons when our own fruit crops are exhausted, or nearly so.

Even in regard to tropical fruits, which formed the subject of an address by Mr. MORRIS, the newly appointed Assistant Director at Kew—of which a report is given in another page—and which hitherto we have not taken much into consideration, the prospects for the home-grower are not brilliant. West Indian Pines, as it is, have to a large extent brought about the abolition of Pine growing in this country, and we see no reason to doubt that if some of the colonies take the matter up they may prove as formidable rivals in Grape culture as they have done in the case of Pines. Even in the instance of soft tropical fruits—the Mangos, the Bananas, the Guavas, the Mangosteens, perhaps

even the Durians—we see no reason to doubt that in the future quick transit and the use of refrigerating chambers on board ship, will enable our colonial friends to supply the market at profitable rates with fruits which at present we only know by hearsay. Of course this will be a public benefit, but whether the home fruit-grower will look at the prospect in this light is another matter. At any rate, we think that the circumstances go to support our contention, frequently expressed, that it would be unwise for the agriculturists to trust to fruit culture alone to remedy the depression under which they are suffering. At any rate, they should not put their trust exclusively in Apples, still less in Pears. If money is to be made it must be in the culture of soft fruits within easy reach of the markets of populous centres, and it must be combined with other crops, such as popular flowers and vegetables. Those who are growing for commercial purposes must take special heed that they put not all their eggs in the same basket, and small growers will do well to develop local trade in their own neighbourhood rather than flood the great markets. It is very anomalous that in country places the casual visitor, and presumably the native, finds a difficulty in getting country products—milk, butter, fruit. Go to a country hostelry, and see what is put before you.

The general results to be gleaned from our tabular statement, which we shall supplement next week with many interesting details, for which we cannot find space this, is that Apricots have been decidedly under average, that Plums are likely to furnish a good crop of fine quality; that Cherries have been very variable and generally good in the South. To Peaches and Nectarines the same remarks apply; Apples, commercially the most important, on the whole are a failure; Pears hardly less so, though fair in the home and southern countries. Small fruits (Gooseberries, Currants, &c.) have yielded a good general average, above rather than below the standard. Strawberries have been generally deficient alike in quantity and in quality—better perhaps in the North than in the South, but still generally bad. Lastly Nuts, including Walnuts and Filberts, are reported generally as deficient. Allowing for exceptional cases, we cannot see much reason for congratulation in the report of the fruit crops for 1886. On the Potato crop we shall report in a subsequent issue.

— THE PROSPECTS OF THE YEAR, when judged by the splendid promise of the bloom on Apples, Pears, and Plums, were so good that, barring the damage effected by frost during the blooming period, we should have witnessed the most prolific year on record. But there were two separate agencies at work against this wished-for consummation, viz., the physical inability of the trees to carry an abundant crop, owing to the exhaustion following on the fine crops of the previous year; the other the inclement weather in April and May. Continued low temperature, accompanied by more than the usual amount of north and north-easterly winds, wrought much havoc, especially in the early districts, where trees come into flower early. The crops of the year, *par excellence*, are Plums of all kinds; Cherries, Currants, excepting black sorts, which are generally thin on bushes; Gooseberries and Raspberries. Strawberries cannot be regarded as a first-rate crop. In Kent we find the Cherry crop stated to be especially good, and as the county is noted for these fruits, this means money to the grower. Damsons and Plums in this county, and generally, are likewise abundant; wall fruit and nuts are not plentiful; Apples and Pears are scarcely found anywhere in abundance in southern shires, with the exception of parts of highly favoured Devonshire and Worcestershire. The Midlands have been more favoured than other parts in the same latitude, as the fruit crops of all kinds are stated to be the finest known for several years, and the fruit trees very clear of insects. In the Eastern Counties much of the blossom dropped off Strawberries, orchard fruit,

&c., so that whole rows of prolific varieties of the former have no fruit on them, and the Apple, Pear, and Plum crop will be a very light one; and on the same coast, but further north, the orchard crops are rather worse. The rainfall over the whole of England, and especially in the counties bordering on the North Sea, has been much below the yearly average—a circumstance that has worked detriment to the fruit crops in those parts, being the cause, together with the starving effects of long-continued cold, of the loss of much of the blossom. The farther we go north or west, the worse become the crops of Pears and Apples, although in some western Plum and Damson districts good crops of these fruits are found. The wall fruits in these parts are also generally thin. The small fruits in Northumberland and Durham are said to be excellent, and Peaches and Apricots are abundant, but we suspect that is where there is the great advantage of heated walls. Scotland can boast of a heavy crop of small fruit; and in the milder parts, some of the finest sorts of Apples and Pears have done well, and Plums in orchards and on walls are a good crop. Over the country generally, there are, however, lamentations about the poorness of the fruit crops. In Ireland the crops of large fruit are thin, some kinds of Plums only being abundant. We may hope in the interest of the growers of market fruit, that in the absence of large crops, the quality will be so good that enhanced prices will recoup them for their loss. And in the greater interest of the consumer, we may be allowed to hope for large consignments of those splendid varieties of Apples, Pears, &c., now to be seen in the Australian Court of the Colonial Exhibition, and which we are assured can be brought from that distant colony with success, and at a season, when our own supplies are naturally coming to an end.

— THE PHYLLOXERA IN ALGERIA.—We have received the following official notice from the Foreign Office, based upon a communication from Sir LAMBERT PLAYFAIR, the Consul-General at Algiers:—

"In my late report of a journey taken in the western parts of Algeria I alluded to the subject of the Phylloxera, which had appeared at Tempenç, and to the measures adopted for stamping it out.

"I regret to report that it has appeared in the east, also in the neighbourhood of Philippeville in three separate localities, although at no great distance from each other.—I have, &c., (Signed) "R. L. PLAYFAIR."
"The Earl of ROSEBURY."

— BEE MANUAL: "LES ABEILLES." BY VICTOR RENDU. (PARIS: HACHETTE & CO.)—This is a useful little book of 111 pages and seventeen engravings. The text is everything that could be desired. The book is approved by the Société pour l'Instruction Élémentaire. The plates, especially those of the bees, are not quite up to those of many other works on the same subject and in the same language. The book will no doubt sell well, as it has in a short space of time passed into the third edition.

— "COMPENDIO DELLA FLORA ITALIANA."—This useful publication, directed by Professor GIBELLI, is now completed, so far as the text goes, by the issue of the general index. Ninety-nine quarto plates, each with analytical details, render this one of the most serviceable works of the kind. The length of time involved in its publication, though inevitable under the circumstances, is the greatest drawback to the book.

— "THE BOTANICAL MAGAZINE."—The July number contains figures and descriptions of the following plants:—

Myrmecodia Beccarii, t. 6883.—A most extraordinary plant. One of many specially studied by Sigor BECCARI, and remarkable for the huge spinous tubers developed on the stems, and which are channelled in all directions by ants, which form their nests in these tunnels, the plants themselves not being specially injured, but flourishing in spite of the disturbance of its interior economy. The plant in question was imported by Messrs. VEITCH from the Gulf of Carpentaria, and was by them presented to the Royal Gardens, Kew, where it is treated as a stove epiphyte.

Aristolochia longifolia, t. 6884.—A native of Hong Kong, with a short thick stem, from which proceed slender climbing stems, with short-stalked long lanceo-

FIG. 22.—CARPENTERIA CALIFORNICA: FLOWERS WHITE, FRAGRANT. (SEE P. 115.)

late leaves, downy on the under surface. The flowers are borne on short stalks, tubular, bent abruptly in the middle, the limb expanded, oblique, two-lobed, purplish-brown.

Galearia clavata, t. 6885.—It is satisfactory to see a third species of this genus which differs so remarkably in habit from *Hyacinthus*, and which is yet structurally so close to it. The flowers are long, tubular, and green, so that though botanically interesting, it is by no means so desirable a plant for gardens

as the two previously described species, *G. candicans* and *G. princeps*.

Pleurothallis Barberiana, t. 6886.—A pretty little species, not likely to find favour with orchidists just at present.

Tulipa Kaufmanniana, t. 6887.—*Nimium ne crede colori* might be adopted as the motto for this and other Tulips, which vary so remarkably in the colour of their flowers. In the present instance the perianth-segments are sometimes white, flushed outside with

brown, or with crimson; sometimes yellow flushed inside with red. In all the specimens, however, the claw of the segments is flushed with orange-yellow, without any black line or encircling horse-shoe mark, as in the nearly allied *T. Gesneriana*.

— FOREIGN HORTICULTURISTS IN ENGLAND. — On Tuesday last, favoured with glorious weather, the twelve Belgian, French, and Dutch horticulturists, including Messrs. J. VAN HULLE, E.

LEMOINE, BESSON, DELAUX (*Chrysanthemum notorii*), C. HAVENTH, and L. WALTHRY HALLEIN, now in England on an excursion to seek information and instruction from the various establishments, paid a visit to Messrs. CANNELL & SONS, Swanley. On arrival they were met by Mr. H. CANNELL, sen.; the nursery and greenhouses were thrown open, and they were allowed to ramble at their leisure, and remain as long as they chose over any special object which interested them most. The construction of the houses, heating apparatus, &c., came in for their share of inspection. Having passed through the various departments of the "Home of Flowers," luncheon was served at the "Lullingstone Castle" Hotel, after which the fruit-growing portion of the neighbourhood (at present in fine pick) was inspected, and the quantities now being despatched to every large town in the North of England appeared to astonish them, a finish being made with a run through Mr. LADD'S immense fruit-growing establishment.

— MESSRS. J. CARTER & CO. AT NORWICH SHOW.—On the occasion of the visit of H.R.H. the Princess of WALES to the show of the Royal Agricultural Society at this town, Mr. SHARMAN, manager to the above firm of London seedsmen, had the honour of presenting to Her Royal Highness a bouquet of Roses gathered from their Rose grounds in Kent.

— IMPORT OF BUFFALO BERRIES.—The Canadian correspondent of the *Liverpool Journal of Commerce* says, that "Mr. W. H. HOOKER, of Brandon, is developing a new industry in the country. The other day he shipped some samples of Buffalo Berries (*Spherdia argentea*), growing luxuriantly on the prairies on that part of the North-West territory, to Messrs. CROSS & BLACKWELL, pickle manufacturers, London, England, as a test. He is confident they will turn out satisfactorily. He gathered the other day 285 berries from two plants."

— NEW PARK AT WEDNESBURY.—We have been informed that Messrs. W. BARRON & SON, of Elvaston Nurseries, are appointed Consulting Engineers and Surveyors to the Wednesbury Urban Sanitary Authority in the matter of a proposed public park, and they have received instructions to prepare plans and specifications for the same.

— KAPOK.—Some attention has been drawn of late to the silk cotton which encloses the seeds of *Eriodendron africanum*, under the name of Kapok. From a communication made to the Agricultural and Horticultural Society of India it seems that the quality of the cotton is much superior in Java to that produced in India, which is attributed to the greater heat of the dry season in the former country. The writer of the communication referred to says:—"The Kapok is only used to fill up mattresses, chairs, &c. So far as I am aware there is in the whole of Java no Kapok plantation. In each village there are some trees, the fruit of which is sold by the natives for one rupee per thousand. When cleaned the price is 30 to 50 Rs. per picul (i.e., 130 English pounds); the price is now very high, but I do not doubt it will rise more when the use is more known. Several people have tried to make the Kapok tree a culture, but all attempts failed, the cause of which must be sought in the enormous salaries."

— CHISWICK SCIENTIFIC AND LITERARY SOCIETY.—An enjoyable garden party was given by this Society in the Royal Horticultural Society's Gardens, Chiswick, on Friday evening the 16th inst., in the large vinery. A number of members of the Society, and a few outsiders (who were specially invited) exhibited a varied selection of objects under microscopes; Mr. G. NICHOLSON, Kew, showing some botanical specimens. The weather was favourable for astronomical studies, and a great attraction consisted of a telescope fitted up on the lawn. Commander ROBINSON, R.N., was in charge of the instrument, and gave information respecting the moon, the planets Jupiter (with his moons) and Mars, as well as several of the fixed stars, &c. A well-dried and well mounted collection of British plants, with botanical descriptions attached was shown by Miss RUTTER, although the names were not in all instances correct. The gardens are most suitable for scientific conversations, and it is to be hoped that this meeting will not be the only one of its kind.

— NOVA SCOTIA FRUIT-GROWERS' ASSOCIATION.—We have before us the report of the Society for 1885. At a time when our societies are languishing, it is interesting to see that, both in the United States and in the Dominion, the practical value of such associations is recognised, and the members do their best to give and receive information on subjects of interest to them. The meetings seem to partake of the character of the conferences which have been so popular at the Royal Horticultural Society, and afford an indication of what people want, and of one excellent means of supplying the want. There is a serious business purpose about these Transatlantic meetings which is in marked contrast to the dilettante gatherings our societies have catered for to so little purpose.

— THE POTATO DISEASE.—We take the following from the *Journal of the Pharmaceutical Society*:—"Dr. A. B. GRIFFITHS has lately made some interesting experiments on the effect of sulphate of iron on the potato disease fungus (*Chemical News*, May 28, p. 256). He found that an aqueous solution of 0.1 gram of ferrous sulphate in 100 grams of water causes perforations of the cellulose walls of the hyphæ and spores, while it does not attack the cellulose walls of higher forms of plant life, the cellulose of which appears to be of a different character, since it is coloured by reagents which do not affect the cellulose of fungi. He also suggests that potash salts in manures, while valuable for the potato, also stimulate the growth of fungi, since CHEVREUL has shown that fungi greatly flourish when watered with a solution of potassium nitrate."

— PINUS ENGELMANNI.—A Pine cone would not appear at first sight to be a suitable material for the fabrication of a hair-brush; nevertheless, Dr. E. PALMER says the Mexican Indians use the cones of the Pine in question for this purpose by removing the corky portion of the scales. Perhaps these Indians do not have much use for such brushes.

— COLOCASIA DEVANSAYANA, *Linden and Rodgers*.—This is a supposed new species of *Colocasia*, of which the flowers are not known. It is derived from New Guinea, and has long-stalked leaves, the stalks reddish-brown, sheathing for half their length; the blades hastate or cordate ovate-acute.

— THE OXFORD CARNATION AND PICOTEE UNION.—The second exhibition of the Union will take place, as last year, in Mr. E. S. DODWELL'S garden, Stanley Road, Oxford, on Tuesday, August 3, and the schedule of prizes recently issued comprises forty-five for collections of twelve or six blooms respectively, and seventy-eight prizes for single blooms, the total money value being nearly £50. In issuing the schedule Mr. DODWELL, the Hon. Secretary, states:—"The object of the founder of the Association has been to foster interest and enthusiasm in the cultivation of the flowers rather by free fraternal communion than by the stimulus of large money prizes; therefore an essential part of the programme is a modest luncheon, free to all subscribers—an arrangement which many years of experience has proved to be good." The 10 A.M. Great Western Railway express from Paddington reaches Oxford at 11.40, and judging begins at noon, to suit the convenience of exhibitors from a distance.

— SKELETON LEAVES.—Some of the best specimens have been seen were exhibited by Mrs. HODGKINS, Beaufort Avenue, Winton, at the recent Liverpool show. They were not only well prepared, but effectively mounted upon a crimson velvet background. Amongst other things a *Nepenthes bicalcarata* was exhibited. Now-a-days, when considerable importance attaches to the distribution of the vascular bundles, these preparations may become something more than mere fancy work.

— AGRICULTURAL SOCIETY OF INDIA.—The last number of the *Journal* contains articles on grafting Mangos by Mr. MARIES; on the preparation of Khea fibre, by Mr. JENNINGS; on the flowering of *Bambusa arundinacea*, by Mr. NICHOLS, and an interesting paper on the rise and progress of the Society in the sixty-five years of its existence. The Society was established in 1820, at the instigation of Dr. CAREY, the Baptist missionary, so favourably known as a scholar and a botanist. The improvement of agricultural and horticultural products was the chief

end aimed at, and this was accomplished by the establishment of an experimental garden, the instruction of the natives, the introduction and diffusion of useful plants, the establishment of a library and museum, and the publication of a Journal. The replies given to questions and the manner in which information is afforded on points of interest, as shown in the *Journal*, alone afford conclusive evidence as to the utility of the Society, which boasts some 561 members.

— HYGROMETER.—For cultural purposes an instrument of precision is not needed, as less exact means answer the end in view. M. le Comte DE BUYSSEON has lately again called attention to the carrels of *Erodium*, whose long beaks roll up when dry, and straighten when moist, like the awns of Stipa and other plants. A small slab of slate or zinc is pierced in the centre, and into the hole the reed is introduced. With the carrel of *Erodium gruinum* M. DE BUYSSEON says that when the beak is quite straight, an atmosphere saturated with moisture is indicated; when it has six coils complete dryness exists, a medium condition being shown by two coils of the spiræ.

— VERONICA SALICORNIODES.—There is a whole group of dwarf Veronicas which mimic *Lycopodium* or dwarf Conifers, and which appear to be anything rather than what they really are. In such cases proof may be demanded, and such is before us in the form of flowering specimens of the plant framed at the head of this paragraph, and which undoubtedly prove the plant to be a *Veronica*. For our specimen we are indebted to Mr. GUMBLETON. Many of our readers will remember the fine group of these species exhibited by Mr. WARE at the meetings of the Royal Horticultural Society on June 22 this year. This group showed how well these plants which are hardy (except perhaps in the severest winters) are fitted for ornamental beds on terraces or for window-garden purposes.

— BLACK COUNTRY FLOWER SHOWS.—Some extremely interesting and instructive papers might be written on "Pitmoond Gardening in the Black Country." By the Black Country is meant that stretch of country lying between Birmingham and Wolverhampton, with ironworks, coal mines, &c., in abundance, and which appears to be at all times encompassed by a dense atmosphere of smoke. Here, one would imagine, gardening must be carried on under great difficulties, and yet three highly successful flower shows are held annually in the month of August—one at Darlaston, one at Bilston, and one at Willenhall. These places, from their geographical position, may be said to form a triangle, and they are about 3 miles from each other. Bilston has probably the largest show, and Willenhall ranks next in importance; in each case the competition is very keen, and the attendance large. And it is worthy of note that while large commercial centres like Wolverhampton and Walsall—probably for want of luck and good management—are unable to support a show, and even Birmingham is without a thoroughly representative exhibition, in these unlovely districts not only are good shows held, but they are well managed, and financially successful. Well done, Black Country!

— PHILIPPINE FORESTRY.—At a time when the forestry question is forcing itself into the foreground, owing to the rapid exhaustion of forests in various directions, it is unfortunate to hear a rumour of the probable early recall of the Commissioner of Forests in the Philippines, and the suspension of the work in which he is engaged. The investigation of the flora was one branch of the work of this department, and when it is borne in mind that practically nothing has been done since the time of CUMING, until the work was taken in hand by DON SEBASTIAN VIDAL, the present Commissioner—and that even now some of the islands are practically unexplored—it will be a matter for sincere regret if the work should come to a sudden termination owing to the unsettled state of the political horizon in Spain.

— THE CISTUS FAMILY.—We welcome the appearance in the *Boletim da Sociedade Brasileira* of a monograph written in French by Professor HENRIQUES, and devoted to the genera and species of *Cistaceæ*. The Professor gives an historical summary of the family, and adopts WILKOMM'S subdivision of the family, and enumerates as European

genera—*Cistus*, *Halimium*, *Tuberaria Helianthemum*, and *Fumana*. This is followed by a sketch of the physical geography and mountain systems of Portugal and of the geographical distribution of the *Cistinæ*. Eleven species of *Cistus* (irrespective of varieties) are noted in Portugal—nine species of *Halimium*, six species of *Tuberaria*, thirteen of *Helianthemum*, and four of *Fumana*, and of these abbreviated descriptions are given, arranged in the convenient form of analytical tables, together with indications of the localities where the species are found. An appendix relating to the hybrids between various species—and which are very common in this genus—is added. In this appendix M. BORNET'S experiments are alluded to. This botanist, it will be remembered, raised numerous hybrids in the garden of M. THURET, at Antibes, where he had the pleasure of seeing them. Unfortunately M. BORNET has not yet published any record of his experiments, but we learn from M. HENRIQUES' statement that M. BORNET succeeded in raising 245 hybrid *Cisti*, that *Cistus ladaniiflorus* yielded results with seventeen other species, but that no cross could be effected between a *Cistus* and a *Helianthemum*, although the pollen of *Cistus salixifolius* produced a hybrid with *Halimium halimifolium*. We would fain hope that Professor HENRIQUES' conscientious monograph may lead to the revival of the cultivation of these very beautiful shrubs, formerly so much in vogue that SWERT published an illustrated monograph of the forms known to him. Now-a-days if a flower is unsuitable for house decoration, or as a "cut flower," it is little esteemed, be it never so beautiful or interesting. Some day intelligence as well as the satisfaction of the mere sense of beauty will be considered, and things will change.

— GARDENING APPOINTMENTS.—Mr. C. TURNER, late of Mostyn Hall, Flintshire, has been appointed Head-Gardener to DAVID BRIMSLOW, Esq., Bitterswell Hall, Lutterworth.—Mr. JOHN SWYTHE, late Gardener to the Hon. Mrs. FOLLOK, Lismany, Co. Galway, Ireland, has been appointed Gardener to JOHN MILLS, Esq., Bisterne Park, Ringwood, Hants.

CARPENTERIA CALIFORNICA.

— THIS is a handsome shrub, which bids fair to be hardy, and of which up to the present more has been heard than seen. It is a native of King's County, California, and was originally described by Dr. Torrey in the *Plantæ Fremontianæ*, t. 7, where, however, only capsules and leaves are shown. These capsules are remarkable, in that they split, not only into valves, but the outer surface of each valve peels off from the inner surface. Dr. Kellogg, in the *Proceedings of the Californian Academy*, vii., 10, alluded to it; and the plant is duly registered in that most useful book of Mr. Sereno Watson, the *Botany of California*, vol. ii., p. 446.

What we know of it is derived from these sources, from the herbarium specimens at Kew, from notices and figures in the *Garden* (October 23, 1880, and July 18, 1885), and specially from the specimen figured, and which was obligingly communicated at our request by Miss Jekyll, of Munstead, near Godalming, who has been so fortunate as to be the first to flower the plant in this country. Miss Jekyll's letter is appended to this note. All that we need add is that the plant is a shrub with lanceolate, rather thick leaves, very finely serrulate, felted with close white hairs on the under surface, and with rather distant nerves. The flowers, as shown in the illustration (fig. 22, p. 113), from a photograph, are very like those of a *Philadelphus*, but differ in having the styles united throughout into one column, while in *Philadelphus* the styles are separate above, though inseparately beneath. The ovary and capsule are more nearly separate from the base of the calyx than in *Philadelphus*, besides which there is in *Carpenteria* the peculiar mode of splitting up of the valves of the pod before alluded to.

"The specimen figured," writes Miss Jekyll, "is a bush about 7 feet high, planted out in a cool greenhouse. There are others out-of-doors (one of them showing bloom on one point). As they have withstood the late severe winter without having a leaf injured, and without any protection except that afforded by a west wall, near which they grow, I think we may consider that this fine thing is hardy, at any rate in our southern counties. Our soil is peaty sand, elevation 400 feet."

THE FRUIT CROPS OF NOVA SCOTIA.

— We are indebted to the courtesy of one of the Canadian Commissioners at the Canadian Exhibition for the following reports on the Apple crop in Nova Scotia from which we yearly import so much fruit of excellent quality:—

Newport.—Potatoes are looking well, and will be probably a good crop, although, on account of continued rains at the usual planting season, very late planted. There is promise of a fine crop of Apples. The trees were loaded with bloom, a large proportion of which have been fruitful. I have noticed, however, on gravelly soils, trees that have a great many yellow leaves, indicating a famished condition. The Plum trees in this vicinity have mostly succumbed to the "black knot."

King's County.—The prospect for the Apple crop is good, and in some sections very good. Some few orchards have been devastated by canker worm; others considerably injured, but not enough to make a material difference in the main crop. And taking the increase and growth of young orchards into account, I should estimate that the crop of 1886 will be the largest ever grown in the county of Kings.

Annapolis.—The prospect of an extraordinary large Apple crop is not as encouraging as it was earlier in the season. There was an immense show of blossoms, but it is reported from many sections that the fruit did not set well, and the present dry weather is causing the nearly-formed Apples to drop off. It is rather early to give an opinion, but there will certainly be an average crop. Small fruit is very abundant, Strawberries being exceptionally fine.

Cumberland.—According to reports from the different sections fruit trees were never in a more flourishing condition, and we look for a bountiful yield in this part of the province. Many localities are becoming quite thickly studded with Apple orchards, varying in extent from seventy up to 200 trees, and most of them not over twelve years old. The varieties found to succeed best are of the more hardy species, as Duchess of Oldenberg, Emperor Alexander, Golden Pippins, Wealthy, English and Golden Russet, Red and White Astrachan. Owing to the "black knot" Plums have been found not to succeed except one variety, Moore's Arctic, which is doing well.

Hants.—The indications of a good Apple crop are fair. The show of blossoms was wonderful, and in all the Apple growing districts considerable fruit has set.

Yarmouth.—Fruit bloom was abundant, and the crop will be large, with favourable conditions for maturing. Small fruit are all doing well; cultivated Strawberries, Wilson chiefly, are beginning to come forward. Raspberries (cultivated), which were a total failure last year, through winter killing of the buds, give promise of a larger crop than I have ever seen; while Gooseberries and Currants make their annual display of well filled branches. Upon the whole the season has been an early and a most favourable one for the farmer; and should no disastrous wind storms occur, the exhibition in October should show unworked excellence of fruit, root, grain, and other crops. Potatoes never looked better, making a strong, healthy, rapid growth; the earliest growers are already in the market with the first of the crop, retailing at 3 cents per pound.

building of a very handsome house he says, "I resolved to have no master-builder but myself," and as a great many people have either built houses or hoped to do so some day, his account of finding a stone quarry on the spot and building far beyond his first plan, for the sake of utilising the excellent materials, must prove attractive to many persons. In "puddling" a fish pond he saved £300 by using a horse instead of ten or twelve men! In laying out his gardens, which cost £150 for ornamental shrubs, he saved hundreds by personal superintendence and continuance—we might say thousands, or the difference between £5500, which the house and grounds cost him, and £10,000, which the same would have cost in the hands of contractors.

We have now shown that this little book of 108 pages contains by no means a dull story, and for that reason, if for no other, its eight chapters are better and more wholesome reading than is at present offered to agriculturists in some of their special papers which are engaged, week after week, in bewailing the bad times. Our author's subjects are as follows:—1, Choice of an Estate; 2, Underwoods; 3, Timber; 4, Building and Contracting; 5, Making Grounds; 6, Farming and Shooting; 7, Fishponds and Aviaries; 8, Conclusion. On these several topics he discourses briefly, and not at all in the style of some preachers, for he does not venture beyond the limits of his knowledge, and only tells what he can himself vouch for as having come within the range of his own personal experience. As an observer of scientific phenomena, and in the domain of natural history, our author seems to us to be sometimes misled, as in the case of a wonderful storm, or something, by which he says his house "was softly and mightily struck" in the night, so that the walls, though 3 feet thick, "rocked with the blow." There is a curious discovery (p. 104) of "a dangerous peculiarity in the manners of wasels with which all strollers in woods and out-of-the-way places should be acquainted." This is, that instead of running away from an intruder they run up him as far as his jugular. A "sure instinct guides them to the largest blood-vessels of all who offend them." We have enjoyed a large acquaintance among wasels and stoats, as well as game-keepers, and have often shot the former and sometimes the latter; but in our district the wasels were not held in ill-odour, at least not morally in connection with human jugulars. Our author relates a fact far more satisfactory when he tells us that he made a good profit of his land consisting of two estates. He says:—"I gave £14,000 for them; farmed them and managed the woodlands almost entirely myself, obtaining, during the whole time I held the land, considerably higher returns than I could have obtained in rent; sold £1000 worth of timber; spent about £5500 on improving house and land; and within fifteen years afterwards had parted with the place, which I had made too grand for my use, for £27,000—the whole transaction leaving me £9500 richer than I was before in money, and richer also in a great deal of pleasant experience and country knowledge." And this in these bad times!

The Rosery.

SOME RECENT ACQUISITIONS IN ROSES.

We have received from Messrs. W. Paul and Son, of Waltham Cross, some blooms of four new Roses, viz., Florence Paul, Lady of the Lake, Grand Mogul, and Silver Queen, the first two being already in commerce, and the others will be first sold in the spring of 1887. Florence Paul is of a dark crimson, of nearly the same tint as the well-known A. K. Williams, from which it was obtained; is of medium size, the petals being slightly recurved; a vigorous grower, and odorous to a slight degree. Lady of the Lake is of a light flesh colour, very full in the centre, especially when half expanded; the foliage is somewhat similar to that of the Provins Roses, and the flower is slightly perfumed. Silver Queen is a very light coloured Rose, approaching to white in the outer petals; the flower is very full and pleasing in form, and the shoots and foliage robust. Grand Mogul, which has already appeared on the exhibition table, is a very dark crimson, darker than the first-named, and is furnished with short recurved petals, fairly numerous, and forming a flatish bloom, with the centre nearly made

Notices of Books.

How I Managed and Improved my Estate. (London: George Bell & Sons, 1886.)

This cheerful book re-appears from the columns of the *St. James' Gazette*, where many readers must have welcomed occasional pictures of country life by one who had given up London work and established himself in Sussex, with a single task in hand, that of the management of a landed estate, which he had purchased for the express purpose of improving it. If, after thirty years experience in management similar to that of our author—building, planting, farming, and all the miscellaneous, delightful, and sometimes unprofitable work of managing land—he had written a volume on the subject, it would have proved, we will not say a better, but certainly a bigger book. His plan, however, is a good one, since he gives his own experience in simple language. In commencing the

up—a good flower when well done. What we miss in most of the new Roses, is that distinctive and always desirable quality, strong true Rose scent. The odour of the Tea Rose is delicious in moderate doses; but it at last becomes overpowering, not so that of the Cablage Rose, and others partaking of the nature of that variety.

NEW ROSES: CAROLINE DARDEN (*Dickson*).

The following extract from a letter received this morning from one of the judges at the Helensburgh, West of Scotland, show, held on last Friday, will interest all lovers of Roses, especially your correspondent, "Wild Rose":—"Dickson, of Newtownards, produced a sensation with their new Roses here yesterday. None could have anticipated that your Emerald Isle would have the credit of producing such a magnificent seedling Rose as Caroline Darden, formerly named after the famous American Dr. Jacks, but now sent out under the maiden name of his wife. It is in the way and build of Charles Lefebvre, or perhaps nearer A. K. Williams, but much darker, of greater substance of petal, and glowing velvety richness. Their Earl of Dufferin, a magnificent new seedling Rose also, got the 1st prize as the best Rose at the show, all classes competing. Besides Caroline Darden and Earl Dufferin, they also received Certificate, First-class, for James Browlow and W. Laird. Rest assured, Murphy, these are Roses that will be heard of in the future." I was rather proud to get this, as last year the *Gardeners' Chronicle* drew attention for the first time to these seedling Roses, and this year confirms the impression. Caroline Darden also got a First-class Certificate a few days since at the Royal Dublin Society's Summer Show. I am sure all lovers of Roses will be proud of the Messrs. Dickson's success. *W. J. Murphy*.

The Flower Garden.

A SURVEY of the general features of the pleasure grounds should now be made. When deciduous trees and shrubs have attained their full size and proper colour of foliage, a better idea can be formed of the requisite thinning and planting where it is desirable to open, or keep open, views of some distant objects, and also where it would be advisable to introduce a light foliaged or flowering shrub, or the dark tints of the purple Beech or Pine. In opening these groves or views, the sides should not be made straight, or they have a formal look, but plenty of spray branches should be left on either side. Should the weather be showery towards the end of the month the planting of shrubs should be commenced. Choose cloudy days for the operation, and see that the soil is well loosened for a considerable distance round the plants, so as to prevent the stagnation of water, which is most injurious to them.

CUTTINGS.

Cuttings of Hollyhock should now be inserted. Choose young shoots when they can be obtained; but they will strike freely from eyes. Cut the side shoots into pieces of one eye each, put them into some slight compost, and under a handlight they will soon strike. Cutting of Pansies should also be made now. It does not signify how small the cuttings are, but they should be taken from shoots which have not flowered, as they will root quicker and more certainly than those which have flowered. Cuttings of Phloxes and many other herbaceous plants should be put in as opportunity offers. If not already attended to offsets of the hardier kinds of *Sempervivums* should be pricked into lines, also cuttings of *Mentha*, *Santolina*, *Hieracium*, and all the other hardy plants used for carpet and other bedding.

ROSES.

The budding of Roses should now be completed. Do not allow the ligatures to remain after the union is completed. Suckers should also be removed as soon as they appear; they are more troublesome this year than usual. When Roses do not receive sufficient water mildew is sure to attack the plants. As a remedy for this disease I have tried soil with good results. I damp the foliage with a fine spray syringe, and dust the soot over them, allowing it to remain

on for three or four days, then washing it off. All flowers should be picked off immediately their beauty is past. Young shoots attacked with greenfly may have their points dipped in tobacco-water. All strong shoots of perpetuals should be shortened. This will induce the plants to produce several flowering shoots from the growths so treated.

GENERAL WORK.

Chrysanthemums in beds will require abundant supplies of manure-water. The same applies to *Dahlia*s and *Hollyhock*s. Keep the seed-pods constantly picked off *Viola*s, and give them frequent waterings with liquid manure, or else they will speedily go out of flower. *W. M. Baillie, Luton Hoe, Beds.*

PLANTS AND THEIR CULTURE.

CHRYSANTHEMUMS.

EASY as these plants are to manage, the press of other work is often the cause of their being but little attended to, and a fine head of bloom is in consequence not obtained. The stronger and more vigorous the plants, the more nutriment they will require, to be given in the shape of manure-water. The pots will now be getting full of roots, and should be plunged in sifted coal ashes, cocoa-nut fibre, or any other suitable material; this keeps the temperature more equal about the roots, besides saving much labour in watering the plants. Where a batch of the earliest varieties are grown to keep up a successional display, the plants will now be showing their bloom-buds, and should now be always watered with some kind of manure-water in a diluted state. Stake and tie all growths as they require it, and pinch back all lateral growths as they appear if single specimen blooms only are required.

ROSES (TEA)

which were turned out-of-doors some time since should now be examined, re-potting any plants that have filled their pots; re-pot or re-tub all young free-growing plants, according to the growth they have made and space they are to occupy, in good fibrous loam, with the addition of some half-inch bones, mortar rubble, and sand enough just to keep it open. Keep the plants well watered at the roots, and syringed overhead twice a day—at least, after potting during hot dry weather, pinching off all buds as they appear, for if these are left on the plants will exhaust themselves before they are wanted for forcing. Place them where they can get the full benefit of light and air, so as to get the wood thoroughly matured. If mildew should show itself, dust all of them over with flowers of sulphur at once. Any hybrid perpetuals that are kept in pots, and which are required for early forcing, must be treated in a similar manner to the Tea varieties.

STOVE PLANTS.

Finish the potting of all winter-blooming plants without delay, place the plants near the glass, keeping them rather close for a few days after potting, afterwards admit more air, so as to get them stocky and well matured, for on this depends the abundant flowering of the plants. *Gesneras* and *Tydeas* will want a warm moist temperature, but avoid the water getting on their foliage. Late batches of *Gloxinia*s must now be in their blooming pots, and should be stood where they can attain their full development; other varieties of this class, such as *Goldustias*, *Scrogaphis*, *Thysananthus*, *Plumbago*, *Eranthemums*, *Kivina*, *Euphorbia Jacquinifolia*, &c., are best plunged in pits near the glass; shading lightly during the hottest part of the day, and shutting up early for a few hours, then putting on a little air later.

Poinsettias and *Begonias* are best kept full exposed to the sun, with plenty of air given; the *Poinsettias* require plenty of water at the roots, for if this be neglected red-spider will be sure to attack them. A quantity of the different varieties of *Coleus* should be potted on for late work, as these plants are found to be very useful for various decorative uses indoors; the persistent increase of insects at this season will render constant efforts needful to destroy them. All climbers that have done flowering should be well thinned out to get the wood properly exposed to the sun, reducing the amount of water at the roots—but not enough to cause them to flag. *A. Evans, Lytle Hill, Haslemere.*

FRUITS UNDER GLASS.

VINES.

THESE in every stage of their growth should have abundance of water given to the roots every week or ten days, providing the drainage is good, following the clear water with copious drenchings with liquid manure until the berries begin to colour; after which period clear water only should be applied, otherwise, in the case of black Grapes, size of berry will be secured at the expense of colour and finish. Vines should never be allowed to get dry at the roots until they have shed their leaves, and then only moderately so, but always inclining to the moist side, which is their natural condition. However, Vines of *Madresfield Court*, should, from the time the berries begin to colour, receive water less frequently at the roots than would be beneficial for other varieties of the Grape Vine. A buoyant and moving atmosphere should be maintained so as to prevent the berries of this fine Grape as far as possible from cracking, and to attain this object the Vines should be allowed to make lateral growth freely so that any superabundance of sap may find vent in the foliage, and thus be drawn away from the berries. As soon as all the Grapes are cut in the early and second early houses, syringe the Vines morning and afternoon so as to rid them of any red-spider that may be present, leaving the ventilators in fair weather at all times fully open, so that the wood shall become well ripened, and prevent the Vines in the early house from pushing into growth, as they frequently show a tendency to do when the atmosphere of the house is kept close and moist instead of moist and airy—moist, so far as the syringing of the Vines morning and afternoon, and damping the pathways, &c. about mid-day goes. Vines cropped light rather than otherwise, and kept well supplied with moisture at the roots, and a free circulation of fresh air maintained from the time the berries begin to colour, are sure to finish their crops well. During hot weather, the vineries containing ripe and ripening Grapes should have the pathways and surface borders damped over with the syringe about 11 o'clock in the morning, and again at 1 and half past 4 o'clock in the afternoon, so as to render the atmosphere congenial to the requirements of the Grapes and foliage alike.

EXPOSING WHITE GRAPES TO THE SUN.

NOW that the danger of the berries of *Muscad* of *Alexandria* being scorched by the sun shining on to them is past, the bunches of this and other white Grapes should be gradually exposed to the sun's rays by tying back the leaves by which they are shaded a little at a time, with a view to the better and quicker colouring of the berries. *H. W. Ward, Longford Castle.*

FORESTRY.

DISEASE OF PINE SEEDLINGS.

I HAVE to tender you my sincere thanks for the interesting information that has been elicited on the subject. I have also received a late issue containing Mr. Worthington Smith's valuable report thereon. There seems, however, to have been a slight misunderstanding with regard to the varieties sent, which I selected from seeds of *Pinus Laricio*, *Corsican*, *P. austriaca*, *P. sylvestris* (*Hagueuau* variety). The *Laurel* and *Fir* seedlings have been unaffected. The disease has vanished as suddenly as it came, and thus left us unable to state whether the action of the sulphur was a preventive in the beds that were dressed. I have for some time been aware, through a long and painful experience, of the Coffee-leaf disease (*Heilmelia vastatrix*), both on my own estate and those of my neighbours, that certain forms of fungus were inherent in the seeds of various trees; and on my first noticing the present fungus it struck me as bearing a marked resemblance to the *Heilmelia* in many of its characteristics. Still in the present instance there is one circumstance which makes me think it may have been due to atmospheric rather than other causes, inasmuch as it has attacked to a greater or less extent plants raised from seeds that were gathered in some seven or eight different localities all

widely remote the one from the other, when the parent trees could hardly have been simultaneously affected—viz., Riga, Scotland, Mayence, Corsica, Barres Vilmorin, Montpellier, and, in the case of *P. austriaca*, some other German or Austrian source. I have observed in the case of *Hemileia*, that although it seems to be ever present in the trees' system, certain climatic conditions are necessary to its development to any serious extent, and that its appearance, therefore, at certain seasons, and in certain weather, can be predicted with some degree of certainty. In the case of the present subject we shall find, I trust and believe, that when the seedlings have passed the cotyledonary stage, they are capable of resisting its influence, or in the event of its existence in a latent form, of throwing it out of the plant's system. Instances of its having attacked, or having been detrimental to, plants of a more mature age, would be of great service. *E. J. C. Brace.*

PROTECTION OF TREES FROM STOCK.

One of the most difficult and perplexing duties devolving upon the forester at all seasons, but especially during the summer months, is that of protecting single trees from horses and other animals, to which they are most frequently and seriously exposed. It is often a source of deepest regret in passing through an otherwise beautiful district of country to find scarcely a tree to gladden the eye and diversify the landscape. In hot weather, too, how painful it is to travel under the scorching rays of the meridian sun, and the cooling shade is as much longed for by the weary footsore traveller as the bubbling spring or sparkling fountain. True it is we regard our park and avenue trees more as luxuries than as objects of utility, and more for the wealthy than the poor. This, to some extent at least, is true, but it is no fault of the rich, nor their desire it should be so, and but for the circumstance that roadside trees are so expensive and difficult to raise there might well be shady bowers and avenues for the poor as well as the rich, and for the public no less than for private persons. This want, however, might be amply supplied and the difficulties overcome but for the one reason, that single trees are so very expensive and difficult to protect and grow to perfection. That hedgerow and park trees can be made safe and secure by various kinds of fencing, there is no doubt; if it were otherwise we should not enjoy the pleasure of those few trees we have; but in these days of economy and utility the expense of erecting the guards is so great as to frighten many proprietors from even attempting it.

In these columns some years ago I described a plan of protection that appeared to be much thought of, and is becoming of general use. The plan was simply that of enclosing the stem or trunk of the tree in a sheet of wire netting, giving to each tree a kind of coat of mail to wear. There is very little skill or art required to put it on, but to those who may never have seen it done a few words of direction may be useful, and should the writer still fail to make the subject clear he will gladly answer any requisitions that may be put to him respecting it. The first thing to do is to procure the requisite quantity of wire netting, usually 30 inches broad, 1½ inches mesh, and No. 16 wire gauge. If the tree is a small one the netting may be put on the whole breadth and overlap the edges so as to take it to the proper width, and thereby avoid cutting, except at the proper length to go as high up the tree as required. It requires to be securely tied by means of brass wire, and when it becomes too tight by reason of the tree enlarging the ties must be slackened and the netting let out. It requires to be securely and firmly fastened to the ground by means of bent pieces of common fencing wire thrust into the ground in the form of staples. This for sheep and cattle is usually quite sufficient, and is equally effective against hares and rabbits. Horses, however, sometimes (though rarely) catch hold of a slack part of the netting and tear it, and to prevent this a piece of barbed wire twisted round the trunk above the netting proves most effective. All this is done cheaply, expeditiously, and gives the utmost satisfaction wherever it has been applied. Both the netting and barbed wire can be so closely and neatly put upon the tree as to be invisible at a very short distance, and can be equally well applied to a limb or branch as to the stem or trunk. It does no injury to the stem if slackened at intervals of years varying according to the growth of the tree.

Apart from animals gnawing the bark of trees they also naturally rub themselves against them, and when

the barbed wire is put on they are completely prevented from doing so, but which, if not provided for in another way, would amount to actual cruelty. What, therefore, should be done in all parks and grazing fields is to erect rubbing posts, which consist simply of a section of a rough tree pruned of its branches (not too close), and sunk 2 or 3 feet into the ground. Such rubbing posts fulfil a twofold purpose—they prevent the animals from rubbing against the trees, gates, and fences, which they greatly destroy, and afford much pleasure and comfort to the animals, which in effect is to induce them to thrive better. *C. F. Michie, Cullen House, July 10.*

THE BROWN, OR SMALL, SWIFT MOTH.

We here illustrate (fig. 23) the transformations of one of the most destructive of our native insects, the caterpillars of which are quite as injurious to many growing vegetables as the larvae of the Heart-and-Dart Moth, *Agrostis tritici* (or exclamationis). The caterpillar, here represented of the natural size, when full grown, at the close of the year and early spring, is of a white colour, with a bright chestnut-red head. It is of a

FIG. 23.—SMALL SWIFT MOTH AND LARVA.

more slender form than is usual with the surface grubs, as the caterpillars which feed on plants just beneath the surface of the earth are called; it is furnished with the usual number of legs, namely, three pairs of pectoral legs attached to the first three segments of the body after the head, four pairs of ventral clasper-legs, and two anal claspers; the body is very sparingly clothed with short single bristles. The head, and the first, second, and part of the third segments of the body, are represented in the upper right-hand figure of our woodcut more highly magnified.

One of our correspondents ("B. W.") sent us some portions of roots of the *Hoteia* (*Spiraea*) japonica with several of these caterpillars, which had gnawed and riddled the roots, as shown in our upper left-hand figure. Another correspondent ("T. W.") sent a number of the caterpillars, which were "devastating many of his plants," of which he gave a list, including the following species:—*Achillea ptarmica* and *serrata*, *Campumula glomerata*, *dahurica* and *Van Iloutteii*, *Bupthalthum salicifolium*, *Ranunculus acemtilifolius* and *amplexicaulis*, *Convallaria majalis*, *Trollius*, different varieties; *Scabiosa caucasia*; *Primula*, different varieties; *Thalictrum*, different varieties; and *Paeonia*, different varieties. They are also destructive to pot plants, Strawberries, Parsnip, Beans, Lettuce, Potato, Celery, and grass roots, and we have found them devouring the young and tender shoots of *Chrysanthemum* before they have found their way above the

surface of the earth. They form an elongate oval cell in the earth for the cocoon in which they change to shining reddish-brown chrysalids, which are longer than usual, and are furnished with short bristles on the rings of the body (see lower right-hand figure in our woodcut), which enable them to wriggle upwards to the surface, when ready to transform to perfect insects.

The moth is here represented of the natural size, but the specimen selected for representation is much more strongly marked with whitish spots and stripes than usual, being generally much more suffused with brown scales, whence the specific name of fuscus, or the brown swift, was given to the more common variety by the late Mr. Haworth. Other varieties have been named *nebulosus*, the spotted silver swift; *obliquus*, the silver swift; and *angulum*, the tawny swift, by the same writer, who was famous for making species out of varieties of common insects. The more ancient name of lupulina given to the species by Linnaeus has, however, prevailed. The moth is extremely active on the wing, flying in the twilight with great velocity, whence all the species of the genus to which it belongs, are termed swifts. This genus was named *Hepialus* by Fabricius, and includes as its typical species the large species vulgarly known as the Ghost moth, *Hepialus humuli* of Linnaeus, the male of which is pure white, and the female tawny-orange with darker markings. The caterpillar feeds on the roots of Hops and grasses, and the common name by which it is known owes its origin to the white male being often seen in grassy churchyards, hovering, pendulum-fashion, over graves, amongst the rank grass among which, the female moth is quietly resting. *T. O. W.*

The Apiary.

TAKING THE HONEY.

I AM now going to address those happy people to whom is allotted the task of taking the honey. I say happy, in a twofold sense, for, firstly of the first, as Moses said in the *Year of Wakefield*, some people will find there is none the bees can spare; and secondly of the second (that's my own), where they can spare it, we can get the honey without doing as my good old Wiltshire mother used to do—burn the bees. The season cannot by any possible means now be a good one, and only those who fed their bees during the cold and dreary days of June will find there is a surplus. The bees must be kept up in strength, and then if the honey season only lasts a fortnight amazing quantities will be brought in. One of the simplest ways of taking the supers off is to take a piece of calico and saturate it well in pure carbolic acid and warm water, one part of calico to twenty of water. Go to a hive, uncover the supers, and simply lay the wet rag over them. Of course, directly you uncover the bees they will come forward, and endeavour to inquire after your health, but do it with promptness and decision and the bees will beat a retreat. So much do they dislike the smell that the boxes will be empty, or nearly so, in a couple of minutes. Then take the box quietly off. You will be sure to find it stuck down. Do not pull it up suddenly, or you would pull up the frames as well, and then great anger would follow, but twist the box a little one way and then another till you find it quite loose, then lift it off and put it in a dark box. I keep a large box for the purpose. Light is excluded from every part of the box except a little hole about half an inch in diameter at the top. In this hole is inserted a pipe made of perforated zinc, and 16 inches long. You can put any amount of honey and bees in a box of this sort, and you could stand it in the middle of your apiary. The bees will soon fly out of the top of the pipe, and the box will never have a bee left in it. You might think that robber bees would get in, but they do not. Robber bees are something like human robbers, *i.e.*, they make mistakes. They endeavour to get into the box, but have no sense to fly to the top of the pipe and go down it. They climb up some other way, and keep on endeavouring to get through the holes of the perforated zinc, which, of course, is impossible. When the bees are all gone you can carry the honey triumphantly away. My box is made to carry frames as well. If the frames contain any bees they depart out

of the pipe the same way as described above. Another time I hope to speak of other traps for bees, and also the best way to take out frames of honey-comb from the hives. *Walter Chitty, Peasey.*

HOME CORRESPONDENCE.

Seeds Transported by Insects.—It is always well to record singular facts that occur in Nature, and I would ask you to allow me to do so in this instance. Some fresh seeds of *Cyanophyllum* were sown in the stove, and much to our surprise none appeared to germinate; in a short time we found that, in pots near to the pan and also in pots on the other side of the stove, there were healthy plants of the *Cyanophyllum* growing with other plants, showing that some insect had transported the seed. We put this action down to ants, and one is led to suppose that the seed contains some property that they are partial to or they would not have gone to so much trouble. *T. Christy, Malvern House, Sydenham, July 14.*

panying the judges taking the levels, they observed this infringement, and commented upon it; and why, under the rules, they were not excluded from competition, I was, and still am, at a loss to know. I protested against this noncompliance with the rules, both before and after the decision, but without effect, and should be glad to know why my protest has not been noticed, or some satisfactory reason given why these breaches of the rules in question were overlooked? I would also observe that my boiler is not a saddle, but a longitudinal tubular boiler of slow combustion. The size is 4 feet 4 inches 3 feet 3 inches, compared with the other competitors, 6 feet long each. The following is a correct statement of the heat, ascertained by thermometers as taken on the ground, and which speaks for itself, showing by the heat obtained that each competitor did his utmost to ascertain the greatest heat each boiler was capable of producing:—

Books on Colour.—One of the best and cheapest works on colour known to me is the new edition of *Field's Chromatography*, by J. Scott Taylor, B.A. (Camb.), published at 5s. by Winsor & Newton, Rathbone Place, W., or obtainable of any colourman. It has four coloured plates or charts of colours. At the same time there are no doubt some other good modern books or colour charts which might possibly prove of equal service to gardeners, botanists, or florists, were they as well known to them as they doubtless are to artists. Reichenbach adheres, I believe, to Winsor & Newton's standard. It must be remembered in all questions of this kind that colour is of relative value only as seen in flowers and pictures, every tint being either strengthened or weakened by that nearest to it; thus, while white heightens the tone of colours next it, black, on the other hand, weakens them. Again, as the Editor pointed out last week in a footnote, colour is so subtle in its variations that probably no two persons see colour exactly alike, and even if they do so, now and then there is the difficulty of nomenclature to be met and accounted for, since a blue one person calls pale blue another speaks of as bluish lilac, another as slate colour or French grey, and so on *ad infinitum*. The

varieties of colours—i.e., tints or hues—being infinite, it follows that no one chart can serve to illustrate these, hence the difficulty of fixing a standard scale of both colours and names. The work mentioned above (Scott Taylor's edition) is the best I know on the subject, being a standard one amongst artists, and so of course not less useful to gardeners, botanists, and manufacturers. *F. W. Burbidge, F.L.S.* [We have received a copy of the work in question, on which we shall report later on, ED.]

Darwinian Idea in Ancient Saxon Times.—The *Exeter Book*, published by the Society of Antiquaries, shows that there was a paraphrase in Saxon verse of a book of animals, dating from the early part of the eleventh century. There is a French metrical translation of this by Philip de Thaan, an Anglo-Norman poet, dating about 1121. Philip de Thaan, in describing the eagle, says it can look straight at the sun, when at its brightest, without blinking. The author says the eagle has acquired this singular property by always taking the very young birds from the nest and compelling them to gaze at the sun; such young birds as could gaze at the light without flinching were preserved by the mother, and such as could not do so were discarded, and not brought up. By this continual process of selection a race of eagles was evolved capable of gazing straight into the sun! *W. G. S.*

Violas as Summer Bedding Plants.—Two notable illustrations of the value of Violas as bedding plants in summer have come under my notice of late, and they serve to illustrate the value of these hardy and easily managed plants in making an effective display. One is to be seen at Messrs. Collins Bros. & Gabriel's nursery at Hampton, Middlesex. The Violas here are really splendid and enduring masses of flower, and when planted by Mr. Jenkins, the foreman at the nursery, he placed a good dressing of cow-dung at the bottom of the bed, and planted the Violas over it. When the dry weather set in the soil about the Violas was covered with a surfacing of decayed Narcissus foliage, keeping the surface cool and moist. The plants are in a fully exposed position, and it may be accepted as a clearly ascertained fact, that Violas will stand a good deal of drought, provided they have something good to root into. The plan of picing a layer of cow-dung or any good manure beneath the surface is a good one; it not only gives the plants something holding to root into, but it ensures a cool bottom also. The varieties used at Hampton are Queen of Lilacs, Countess of Kintore, deep blue-purple and white; Archie Grant, rosy-purple; True Blue, clear blue; Ardwell Gem, sulphur-yellow; Golden Queen of Spring, pale yellow, remarkably free; Countess of Hopetoun, pure white; Lady Polwarth, pure white; and Elegans, mulberry. In the beautiful public park at Wolverhampton, Violas are used by Mr. Thomas, the Superintendent, with great effect. They are mainly employed as edgings to shrubbery borders, and they can be seen in long broad lines, blooming so freely that the foliage is almost hidden from view. Some were planted last autumn, others in the autumn of 1884 or the spring of 1885. Particularly striking and effective are the *Troy*—a very fragrant form of *Lutea grandiflora*, *Hollyrood*, (Queen of Spring, Dean's White Bedder, and one or two others. Beds are also filled in the same way, and they are very effective also. Some fancy Panisies are largely used, especially a well-known variety named *Thomas Granger*, which can be seen flowering in dense masses. Common annuals, Foxgloves, Sweet Williams, &c., the latter especially, are largely used, and one realised how valuable they are for decorative purposes when used in a mass. The admirable manner in which the park is kept reflects the highest credit upon Mr. Thomas. *R. D.*

Hardiness of the Himalayan Hemlock Spruce in Hampshire.—I enclose a few sprays with new and old cones of *Abies Biunonica*. The tree from which they were taken is about 20 feet high, and has been planted out about twenty-five years in very poor gravelly soil, but somewhat sheltered by other trees. *Wm. Henry Rogers, Red Lodge Nursery, Southampton.*

FRUIT NOTES.

PINE-APPLE NECTARINE.

ON looking over the gardens at Warwick Castle the other day I observed in one of the Peach-houses the above Nectarine, bearing a crop of wonderfully fine fruit. Mr. Christie informed me he had been gathering of the same tree for some time, and some of the individual fruits he had weighed had turned the scale at 5½ oz. Is this not an exceptional weight for Pine-apple Nectarine? I send you by parcel

Colour Inheritance.—Last autumn, when at Glen Eyre, Southampton, I obtained cuttings of one of the bluest flowered Hydrangeas I ever saw. I purposed testing the effect of our soil here in respect of floral coloration, and have, now that one of the plants is in bloom, evidence that the beautiful blue tint has departed, and only the normal hue of pink remains. I must say I did not expect anything else, but still thought the experiment worth making. The question remains, What peculiarity is, there in the Hydrangea that diverse soils should thus affect coloration of its flowers? Are there any other plants, the flowers of which are similarly affected by diverse soils, and if so which are they? The soil which produces blue Hydrangeas has not yet been known to produce the anxiously-looked-for blue *Dahlia* or *Rose*. After all it seems uncertain [not at all] whether the coloured portions of the Hydrangea are really flowers of the coloured bracts of foliage. If it be the latter then the curious variations in colour to which these are subject may be explained. With respect to the peculiarity alluded to at p. 82, of a black Grape producing white fruited progeny, no information is given as to the other parent—assuming that it had one other, and perhaps it was a white one. It is well known that the pollen parent as a rule exercises the greatest force upon the cross effected. I have a case now in which seed from a purple Potato crossed with a red Potato has produced seedlings having white tubers, but Potatoes in their progeny are very erratic. *A. D., Belfast.*

Iris filifolia.—Amongst many bulbs sent to me about this time last year, collected by my son near Gibraltar, were three bulbs of *Iris filifolia*, which he found growing in exposed crevices near the summit of the rock. I have heard that this species is not hardy in England, but I planted them all in sheltered crevices exposed to the south, and so narrow that the bulb touched the rock on both sides, and all flowered well at the end of June. *Iris filifolia* in general habit is not unlike *Iris (Xiphium) lustranica*, but has slenderer leaves. The flowers are purplish-blue, with a line of clear dark yellow running down the centre of the falls. *C. Wolley Dod, London, July 17.*

Foxgloves.—At the Botanical Gardens, Hull, Mr. P. McMahon, the Curator, has a very fine strain indeed, and the long and massive spikes of blossoms are objects of great beauty just now. The variety of colours is as remarkable as the size and thick marking of the flowers, especially the spots and blotches in the throats of the blossoms; the white flowers are variously spotted with dark brown and black, and there are some other very pleasing shades. Mr. McMahon uses the Foxglove as an edging to clumps of shrubbery, and the spikes of bloom are thrust up and through the outermost fringe of branches. Some of the spikes of bloom would measure 4 and 5 feet in length. Foxgloves can be sown now, but it is best if done in March and April, so that the plants may be strong and thoroughly established by early summer the following year. *R. D.*

The Boiler Competition at Liverpool.—In your paper of the 10th inst. I observe an article on the subject of the recent horticultural boiler contest at Liverpool, in which my name is mentioned as a competitor, and inasmuch as the article contains statements which are somewhat erroneous, will you allow me a small space to correct them? In the first place, I must mention, in the 2000 feet contest the following rules should have been observed, namely:—Rule 5, that the rise in 100 feet should not be more than 6 inches; and Rule 6, that no boiler should have more than one flow and two returns. Both of these rules I strictly complied with, but my two competitors did not observe them, and whilst accom-

post two fruits gathered to-day, and which weigh 7½ oz. and 6½ oz. respectively; the samples sent are not picked, but the fruit all over the tree are in equally fine condition, and dozens could be gathered equal to what I have sent. *Robt. Greenfield, Friary Gardens.*

[Very fine samples indeed, but the heat and the cotton-wool had unfortunately made them uncatchable. The fruit measured 3 inches in diameter. ED.]

APPLE RAMBOUR MORTIER.

This Apple was raised by M. Mortier, and is, says the *Bulletin d'Arboriculture*, an excellent market Apple. The tree is vigorous, hardy, symmetrical, and prolific; the fruit large, slightly conical, yellow streaked with red. Flesh yellowish, juicy, soft, aromatic. Season February to April.

Reports of Societies.

HULL, EAST RIDING AND NORTH LINCOLNSHIRE: July 14, 15, 16.

The annual exhibition of the Society took place in the Botanic Gardens, Hull, on the above dates, but under manifest difficulties, for, though the weather was fine and bright, the wind blew with terrific force from the flumber, and so affected the stability of the tents that all the fruit had to be removed from that in which it was staged; and one of the long plant tents, that containing the choicest plants, had a portion of the roof torn into strips, to the great concern of the exhibitors, and damage to the visitors. The exhibits were arranged in four tents, two of them very large ones. Some good features were present, and the fineness of the day brought a good attendance of visitors. The mishap to the tents occurred just before the completion of the judging, and reporting became a difficult matter. The arrangements of the show were carried out by Mr. Philip MacMahon, the Curator of the Botanic Gardens, and his colleagues; and had the wind been less violent, everything would have proved enjoyable. The Botanic Gardens are extremely gay just now, and visitors had the privilege of walking about them.

STONE AND GREENHOUSE PLANTS.

One of the leading classes was that for ten flowering and six foliated plants, Mr. James Cypher, nurseryman, Cheltenham, being the only exhibitor, and staged a fine lot, consisting of *Clerodendron biflorum*, *Erica venosa*, *E. ferruginea* major, *E. tricolor* major, *Ixora salicifolia*, *I. Pilgrimi*, *Anthurium Scherzerianum*, *Allamanda nobilis*, *Bougainvillea glabra*, *Croton*, *Prince of Wales*, and *C. Sunset*, *Kentia Castellaryana*, *K. Fosteriana*, *Cycas revoluta*, &c. Mr. W. G. Nation, gr. to W. Glossop, Esq., Endsleigh, Hull, had the best six plants; and Mrs. Koss, Hull, was 2d. Mr. Nation also had the best three plants.

Mr. A. K. Greene, gr. to Sir A. K. Rollitt, Hull, had the best specimen plant in flower, staging a huge yellow *Picotée*, well grown, and laden with bloom; Mr. Nation being 2d, with a fine *Hydrangea hortensis*.

In the amateurs' classes small but neatly grown plants were shown; Mr. J. Melbourne, Hull, had the best twenty; and Mr. J. Long the best ten.

ORCHIDS.

Mr. Cypher was the only exhibitor of six plants, having neat and nicely-flowered examples of *Saccobulbium Blumei*, *Dendrobium infundibulum* and a darker centred variety; *Cattleya Mossie*, *C. Mendelii*, and *Cypripedium Laurenceanum*.

FINE-FOLIAGE PLANTS.

Mr. Green had the best ten ornamental plants, staging fine examples of *Cocos flexuosus*, *Cibotium regale*, *Areca Verschaffeltii*, *Latania borbonica*, *Atropphia excelsa*, *Anthurium regale*, &c.; Mr. R. Simpson, nurseryman, Selby, was 2d, with smaller plants, Mr. K. F. Jamieson, Hull, being 2d. The best specimen plant was a superb specimen of *Phyllanthus niveus* from Mr. Nation; Mr. Greene coming 2d with *Dasyllium acrotrichum*. Mr. A. Leadbetter, gr. to A. Wilson, Esq., Tranby Croft, Hull, had the best four Palms, very good specimens indeed, fresh and even, but unnamed; Mr. Greene being 2d. *Coluseas* were fairly well shown.

FERNS.

Some good tree Ferns were shown by Messrs. Greene, Simpson, and others; exotic Ferns were small, but clean and healthy; and *Lycopodiums* were nicely shown by the Rev. Canon Newton, of Hull. Mr. R. Simpson had the best twelve hardy Ferns.

GROUPS ARRANGED FOR EFFECT.

These were the leading feature, and made a fine display in one of the large tents. The best to fill a space of 200 feet came from Mr. Greene, and this showed much more artistic merit than either of the others, overcrowding being a common fault; Mr. G. Cottam, Hall Gate, Cottingham, was 2d; and Mr. R. Simpson 3d.

Mr. Cottam had the best group to fill a space of 100 feet; Mr. Simpson being 2d, and Mr. Greene 3d.

MISCELLANEOUS FLOWERING PLANTS.

These included *Pelargoniums* of various types, *Fuchsias*, tuberous-rooted *Begonias*, bedding plants, &c.; they were numerous, but not of a nature to call for special remark.

CUT FLOWERS.

Of these there were a good lot, but the unfortunate accident to the tent prevented the taking of notes. Cut *Roses* were a good feature, and some capital blooms were shown. Messrs. Harkness & Son, nurserymen, Bedale, had the best thirty-six *Roses*; Messrs. G. Swales & Son, Beverley, being 2d.

Mr. J. Fisher had the best twenty-four; Mr. H. May, Hedale, being 2d.

Mr. May had the best twelve; Mr. H. Norton being 2d. Mr. H. Stourton, J.P., Holme Hall, Hull, had the best basket of *Roses*, Mr. J. Fisher being 2d.

Bunches of hardy perennials, and also of hardy annuals, shown in twelves, made a pretty display. Mr. A. Wilson, J.P., and Mr. G. Cottam, took the leading prizes.

The only exhibitor of cut *Orchids* was Mr. J. Cypher, who staged a very fine lot.

Pansies, *Phloxes*, and *Carnations*, were also shown.

FRUIT.

Mr. Leadbetter was the only exhibitor of a collection of fruit. The best collection of eight bunches of *Grapes*, not less than four varieties, came from The Gardens, Dalton Hall, Hull, the gardener, Mr. J. Allsop; Mr. J. H. Shaw being 2d. Mr. Shaw had the best two bunches of white *Grapes*, Mr. Allsop being 2d, while Mr. Nation had the largest bunch of *Grapes*. Other fruit consisted of *Melons*, *Peaches*, *Cherries*, *Strawberries*, &c.

VEGETABLES.

were a good feature, some of the leading prizes going to Mr. Clark, of Studley Royal. Cottagers also exhibited vegetables, and very creditably too, notwithstanding the backwardness of the season.

NOTTINGHAM HORTICULTURAL AND BOTANICAL: July 14 and 15.

The Society held its summer show in the picturesque grounds of Mapperley Park. The exhibition collectively was a good one, each department, including plants, cut flowers, and fruit, being well represented. One of the best features of the show was the groups of plants arranged for effect which filled the greater part of two large tents, and the winning groups were remarkably well arranged.

For group occupying 275 superficial square feet, first honours in this class went to Mr. Lyon, gr. to Viscount Ossington, Ossington Hall, Newark, who had a good group well put together, the plants used being suitable for the purpose, and well chosen as regards colour; 2d, Mr. S. Thacker, Nottingham, who also had a well-arranged group; 3d, Mr. Ward, gr. to T. H. Oakes, Esq., Kiddings Park, Alfreton, Derby. The smaller groups, occupying a space of 123 superficial feet, were also very well done; Mr. Massey, gr. to Alderman Lambert, Mapperley Hall, taking the lead with one of the best examples of this style of arrangement that has come under our notice—lightly and beautifully put together; 2d, Mr. Swanwick, gr. to Colonel Seely, Sherwood Lodge, who likewise showed well.

STONE AND GREENHOUSE PLANTS.

In the class for six, three flowering and three fine-leafage, Mr. Ward was well in front, staging a good *Ixora*, *Erica*, and *Kalosanthes*, associated with three handsome foliage examples; 2d, Mr. Meadows, gr. to C. J. Cox, Esq., Rock House, Old Basford; 3d, Mr. Lyon, both staging fresh, healthy specimens.

Single specimen flowering stone plant.—1st, Messrs. J. R. Pearson & Sons, Chilwell, Nottingham, with a large, well grown example of *Dipladenia boliviensis*.

Single specimen flowering greenhouse plant.—1st, Mr. Meadows; 2d, Mr. Attenborough, gr. to W. H. Farmer, Esq., Alexandra Park.

FINE-FOLIAGE PLANTS.

With six, Mr. Meadows was 1st, having in a nice collection good plants of *Kentia Belmoreana*, *Areca rubra*, and *Latania borbonica*; 2d, Mr. Lyon. Single specimen foliate plant.—1st, Mr. Thacker, with a large *Croton*.

Three *Coleus*.—1st, Mr. Edington, gr. to W. H. Ashwell, Esq., Woodthorpe Grange, Sherwood, with large specimens, the varieties remarkably distinct in their general character, an essential which many exhibitors of these and other plants, of which there are now such numbers of varieties, do not always keep sufficiently in view; 2d, Mr. Attenborough.

Three *Caladiums*.—1st, Mr. Massey; 2d, Mr. Collins, gr. to H. M. Baies, Esq., Elm Bank. Six dinner-table plants.—1st, Mr. Ward, who had well-detailed examples, right as to size; 2d, Mr. Lyon, who also staged very pretty plants.

TUBEROUS BEGONIAS.

With a nicely flowered half-dozen, Mr. Attenborough was 1st; Mr. Collins being 2d.

Gloxinias were well shown. With six Mr. Sutton, gr. to J. Fisher, Esq., Fair Lawn, The Park, Nottingham, had 1st, staging erect varieties, beautifully flowered; 2d, Mr. Drown, gr. to Dr. Powell, who also had a meritorious collection.

ORCHIDS.

were large in number. 1st, Mr. Meadows with three, staging *Oncidium macranthum*, *Epidendrum vitellinum*, and *Cypripedium barbatum*.

Single *Orchid*.—1st, Mr. Clark, gr. to W. J. Wightman, Esq., Nottingham, with *Stanhopea insignis*, nicely flowered; 2d, Mr. Meadows.

FERNS.

Mr. Lyon was 1st with six, staging a fresh well grown group, consisting of *Gymnogramma chrysophylla*, *Davallia Mooreana*, *Adiantum trapeziforme*, *Platycerium alnicorne*, *Asplenium nidus* aise, and *Woodwardia radicans*; Mr. Meadows, who was 2d, also had a pretty group of ferns.

Three *Ferns*.—1st, Meadows. Two *Tree Ferns*.—With these, in a close row, Mr. Attenborough took 1st, having two beautiful medium sized examples of *Cyathea dealbata*; 2d, Mr. Ralphs, gr. to J. Booth, with two specimens of *Dicksonia antarctica*.

Lycopodiums were well shown by Mr. Collins, who had finely grown plants; 2d, Mr. Ralphs.

ZONAL PELARGONIUMS.

With six double varieties Mr. Ralphs took the lead, his plants being well grown and compact; 2d, Mr. Attenborough.

Three *Fuchsias*.—1st, Mr. Collins. Basket of plants arranged for effect.—These were well done; Mr. Mee, The Gardens, Wollaton Park, Nottingham, being 1st, and Mr. Walker, gr. to J. W. Lewis, Esq., Hardwick House, 2d.

Artistic stand arranged with *Ferns*.—1st, Mr. W. A. Edwards, Woodthorpe Drive.

Two hanging baskets.—1st, Mr. Attenborough, with *Hoya bella*, and *Platycerium alnicorne*.

CUT FLOWERS.

Roses were very well shown, the flowers not having suffered as they have done further south for want of rain. With thirty-six single blooms, Mr. W. H. Frettingham, The Nurseries, Eeoston, had 1st with a good stand; 2d, Mr. J. Howe, Nottingham, who likewise exhibited well.

Twenty-four single flowers.—1st, Mr. J. Howe, staging a beautiful lot of blooms; this stand contained the premier *Rose* in the show, a splendid bloom of *Countess of Rosebery*; 2d, Mr. Hallam. Twelve *Roses*.—1st, Mr. Hallam. Six *Roses*.—1st, Mr. J. Foljambe. Twelve bunches of stone and greenhouse flowers. Here Mr. Ward took the lead, putting up large bunches of good varieties; 2d, Mr. Mee.

Collection of hardy herbaceous flowers.—1st, Messrs. Pearson & Sons, who exhibit contained a fine assortment of *Dolichanthus* and other favourite kinds very well arranged; 2d, Mr. Mee.

FRUIT.

The fruits shown were very well done and abundant, and were an attractive feature of the show. With six dishes Mr. Edmonds, gr. to the Duke of St. Albans, Bestwood Lodge, was 1st, having very good *Black Hamburg Grapes*, a *Queen Pine*, *Royal George Peaches*, *Lord Napier Nectarines*, *Figs*, and a *Melon*; 2d, Mr. Roberts, gr. to Hassey Pucke, Esq., likewise staging a good collection, the best of which were *Black Hamburg* and *Muscat* of *Alexandria Grapes* and a *Queen Pine*; 3d, Mr. Ward, who had two good bunches of *Muscat Hamburg Grapes*.

Two bunches of *black Grapes*.—1st, Mr. Ward, with *Black Hamburg Grapes*, medium sized bunches, perfectly finished in every respect; 2d, Mr. J. Forest, gr. to J. P. Fearfield, Esq., Stapleford. Two bunches of white *Grapes*.—1st, Mr. D. Roberts, with nice bunches of *Muscat* of *Alexandria*; 2d, Mr. Ward.

Single *Pie*.—1st, Mr. Edmonds; 2d, Mr. Roberts, both showing *Queens*.

Dish of *Peaches*.—1st, Mr. Edmonds, with fine *Royal George*; 2d, Mr. Roberts.

Dish of Nectarines.—1st, Mr. Edmonds, with Lord Napier; 2d, Mr. Ward, with Violette Hâtive.

Scarlet-fleshed Melon.—1st, Mr. Melville, gr. to W. Hornshy, Esq., St. Vincent's, Grantham; 2d, Mr. Edmonds.

Green-fleshed Melon.—1st, Mr. Massey; 2d, Mr. Walker.

Mr. B. S. Williams, Upper Holloway, received a well merited commendation for a large and beautiful group of miscellaneous flowering and fine-leaved plants, including numerous Orchids, Ixoras, Heath, Lilies, Amaryllis, Anthuriums, Palms, Ferns, Crotons, Nephenthes, &c.

Messrs. Pearson contributed a large and varied group of flowering and fine-leaved plants, and also a good collection of hardy Ferns, amongst them being some large and finely grown examples.

From Mr. W. Bardill, nurseryman, Stapleford, came a very good collection of evergreen trees and shrubs.

Mr. Don, seedsman, Chapel Bar, Nottingham, exhibited a number of wire stands, Fern cases and hanging baskets, nicely arranged with suitable plants, and also some galvanised handlights, durable and well adapted for the various uses to which appliances of this sort can be turned.

CHISWICK HORTICULTURAL: July 15

THIS Society again received permission to hold its show in the gardens of the Royal Horticultural Society. The weather being fine and not too hot there was a fair attendance of visitors. The show itself assumed proportions larger than those of any previous exhibition of the Society, and was generally acknowledged to be the finest show held in the district during the present season. There were two large marquees, besides the great vinery and another large house, which were well filled with exhibits.

GROUPS.

One tent was almost completely devoted to the groups of plants arranged for effect, which are always a charming feature at the Chiswick show, the smooth, well-kept lawn (on which the tent was erected) serving to display their beauties with great effect.

In the 1st class, for a group occupying 100 square feet, the 1st prize was awarded to Messrs. Hooper & Co., Twickenham, for a very pleasing arrangement of Palms, Crotons, Orchids, Liliiums, Ferns, &c., with clumps of their fine rosy-pink coloured *Petunia* Empress, which was particularly telling. Messrs W. Fromow & Sons, Sutton Court Nursery, Chiswick, were 2d, with a group almost equally good, the Orchids being especially nice; 3d, Mr. W. Brown, Richmond.

For a group of 60 square feet Mr. J. Hudson, gr. to H. J. Atkinson, Esq., Acton, was 1st, and Mr. Chadwick, gr. to E. M. Nelson, Esq., Ealing, was 2d. Both groups were of good quality.

Amongst groups not for competition Messrs C. Lee & Son, Hammersmith, contributed a very large and extremely interesting collection of Palms, *Aracaria excelsa*, *Draecena*, *Aspid. dactyloides*, standard *Eucynpus* and variegated *Ivies*, *Kalanchoes*, *Roses*, and *Stactis floribunda*, &c. Mr. Roberts, gr. to Messrs. Rothschild, also sent a remarkably pretty group, which was highly commended, *Gladiolus Colvillei*, the *Pancretium* being very prominent. Mr. May, gr. to the Marquis of Bute, Chiswick, also sent a good group.

STOVE AND GREENHOUSE PLANTS.

These were well shown, Mr. Bates, gr. to Mrs. Meek, Twickenham, being 1st, *Douglasville glabra* and *Dendrobium clavatum* being the best plants. Mr. Chadwick showed a particularly fine plant of *Stactis profusa* in his collection. This exhibitor also staged a fine lot of six fine-foliaged plants, securing 1st prize with them.

ORCHIDS

were fairly well shown, the 1st prize being awarded to Mr. H. James, Lower Norwood—*Cattleya Gaskelliana*, *Aerides*, *Fidlingii*, *Cattleya Leopoldi*, and *Cypripedium barbatum* being his best plants; 2d, H. Little, Esq., Kingston.

SELAGINELLAS

formed a splendid feature. Mr. Wright, gr. to E. H. Watts, Esq., Devonhurst, Chiswick, staging a remarkably fine lot of six pyramidal plants some 3 feet in height, *S. cæsia*, *S. uncinata*, *S. Mertensi*, and *S. Kraussiana* being the best.

SCARLET GERANIUMS AND GLOXINIAS

were well shown by H. G. Lake, Esq., and Messrs. Hooper & Co., Twickenham.

CUT FLOWERS.

Roses were fairly well shown, the best stand of twenty-four coming from Mr. Rumsey, with the

usual show varieties; Mr. Bunyard, Ashford, Kent, being 2d. Messrs. C. Lee & Son and Messrs. J. Veitch & Son exhibited large collections of fine blooms not for competition.

A special prize, offered by the Marquis of Bute, for York and Lancaster Roses, brought these competitors, the 1st prize being awarded to Mr. Fountain, gr. to Miss Woods, Ealing. It may be remarked that although these prizes have been offered by the Marquis for six years in succession, this is the first time that there has been any competition for them. *Gloxinias* were particularly well shown.

Prizes, to be competed for by the Board School children, were offered for the best arranged bunch of flowers, and another for wild flowers, and brought forward a large number of youthful competitors.

TABLE DECORATIONS AND BOUQUETS

were extensively shown, and created great interest. The class for three stands suitable for the decoration of a dinner-table brought seven competitors, the 1st prize being awarded to Mrs. Hudson, Gunnersbury, for a very elegant arrangement; 2d, Mr. Chard, Clapham; and 3d, Mr. Prewett, Hammersmith.

In the class for three bouquets a keen competition took place, Mr. Chard being awarded the 1st prize; 2d, Mr. J. A. Morris, Acton; and 3d, Mr. Brown, Richmond.

FRUIT AND VEGETABLES.

Fruit was not very largely shown, and calls for no special remark. Vegetables on the other hand were largely and well shown, the chief prizes being carried off by Mr. J. C. Waite, Glenhurst Gardens, Esher.

MEDALS.

The Royal Horticultural Society offered two Silver Medals for the exhibitor who had the most meritorious aggregate display of plants and flowers, and of fruits and vegetables. Mr. Wright, Chiswick, secured that for plants, and Mr. Waite the one for fruits, &c.

COLONIAL NOTES.

BRITISH COLUMBIAN TREES.

The following table, prepared by Mr. Mohun, shows the mean breaking loads of some of the British Columbia woods. The pieces tested were 1 inch square, with a span of 1 foot, supported at both ends and loaded at the centre, and were fair average specimens of building timber, partly seasoned, but free from knots and flaws. The tests were made through the courtesy of Mr. R. Jones, at the office of the Dominion Inspector of Weights and Measures:—

Description of Timber.	Mean Breaking Load.	Weight of a Cubic Foot.	
		Specific Gravity.	Weight in Pounds.
Yellow Cypress (<i>Chamaecyparis nutkaensis</i>)	693	.5905	31.21
Birch (<i>Betula papyrifera</i>)	630	.6025	37.57
Red, or Doug. Fir } (<i>Pseudotsuga Douglasii</i>)	638	.5813	34
Alder (<i>Alnus rubra</i>)	567	.5158	32.46
Maple (<i>Acer macrophyllum</i>)	580	.5999	37.44
White Pine (<i>Pinus monticola</i>)	473	.4457	27.79
Cedar (<i>Thuja gigantea</i>)	453	.4904	24.95
Spruce (<i>Picea sitchensis</i>)	427	.415	25.88
Hemlock (<i>Tsuga Mertensiana</i>)	400	.5037	31.44

The results given by exceptionally good specimens have been eliminated from the above table. It may be mentioned that one piece of Douglas Fir only broke under a load of 850 lb., to have included which would have raised the mean breaking load to 660 lb.

SPORTING IN FRUITS.

Mr. C. E. Hogg, of the Survey Department, brought us this week an unusual specimen of Grapes. The bunch weighed 1 lb., and was in two divisions, one of which was of the Black Hamburg variety, the other part were Muscats. The two varieties were growing from the one stem. The amalgamation is unusual, and was a result, no doubt, of hybridisation, brought about by bees while the parent Vine (the Hamburg, evidently) was in flower [?]. The circumstance is suggestive of what can be done by the very useful and most interesting process of hybridising—a process which, by the way, is not followed so much as it might be by fruit growers. Florists amongst us devote more attention to the subject, and secure very

peculiar, and at times valuable results in their floral favourites. The main value of hybridising in fruit culture would be in securing varieties with desirable qualities of richness, hardness, &c., which can be got by hybridising one or more varieties. *Australian Town and Country Journal*, April 10.

— In your issue of the 10th inst. is mentioned an extraordinary bunch of Grapes, consisting partly of Black Hamburgs and partly of Muscats—whether black or white is not stated. The cause of this phenomena is attributed to the operations of bees, as I read it, on the bloom to which the fruit in question succeeded, as the bunch does not appear to have been borne by a seedling *Vioe*. It would be interesting to me, if to no one else, to learn whether the fertilisation by insects or any other means has been proved to alter the form or character of fruit or seed vessel on the parent plant. The case referred to appears to me to be one of those freaks of Nature commonly called "sports." The presence of Navel Oranges on common Orange trees has also been attributed to bees, but I believe this conclusion has been jumped at, as I have not heard of any one who has worked out the experiment for himself, which might be easily accomplished. I heartily endorse your recommendation to practise hybridising, as I have seen the immense benefits which result, but they must be looked for in the seedlings. I have found with flowers that, provided the parents be distinct in some respects from each other, the offspring, however numerous, will not contain two producing forms exactly alike. The late Mr. C. Darwin proved that it is a general though not infallible rule that cross-fertilisation is beneficial to the offspring, some of his experiment being conducted through twelve or more generations. *C. Bennet, Gordon*, April 14, in the *Australian Town and Country Journal*. [See our issue for Jan. 30, where there is an account of a curious Lemon, the supposed result of hybridisation. ED.]

Florists' Flowers.

AURICULAS.

UP till now the portion of our Auricula plants set apart to save seeds from are still in the Auricula-house; but we will report them, and place in frames behind a north wall as soon as possible after the seeds have been saved. The usual practice is to sow the seed as soon as they are ready; many persons, on the other hand, wait until the spring. I am amongst that number, preferring to wait, because the largest proportion of the seeds do not vegetate until the spring, and it requires considerable patience to attend to the 'seed-pots' for six months, keeping the soil moist, &c. The small seedling plants raised from seeds in the spring must also be grown on without any check. We usually flower them in large 60-sized pots, using good rich compost, and carefully attending to their wants as regards supplying them with water. They must also be kept quite free from greenfly by fumigating, or dusting with tobacco powder.

CARNATIONS AND PICOTEES

are coming into flower out-of-doors. The recent very hot weather has caused the flower-buds to swell at a very rapid rate, they will therefore not be more than a week later than usual. The flowers are constantly attacked by thrips when the weather is so hot as it has been recently; they attacked the flower-buds even before the flowers show their colour, and it is very difficult indeed, to destroy them in any other way than by taking the plants into a glass house and smoking them, or by dusting the opening pods with dry tobacco powder will also destroy them. Attend to tying the pods of those likely to burst with a strip of mitting. Tree Carnations should now be placed out-of-doors, and must not be allowed to suffer from want of pot-room. Place sticks to the plants, and syringe them on dry hot days.

Pinks are yet in still flower, and besides their sweet perfume are certainly very pretty. This week, we shall take off the pipings, and if it does not rain the bed will be well watered; the pipings do not form roots well unless they are brittle with moisture at the time of taking them off. Those who have no frames or hand-glasses to spare will succeed in propagating the Pinks out-of-doors if they take off

pipings in rainy weather, plant them in fine sandy soil and shade from bright sunshine.

The forcing Pinks of which cuttings or pipings were put in during April, are now ready to be planted out in the open ground. Let the plants be 9 inches apart, in light, deep, and rich soil. They will make very good growth if they are kept supplied with water during dry weather. I like to have large specimens by the end of September or first week in October, when they are dug up and potted for forcing.

DAHLIAS.

The effect of the hot weather has been to force the plants into bloom. If we had not removed the flowers the whole collection would have been in flower. Some plants that were left alone have each fully developed flowers upon them. The right treatment for the plants at present is to pinch off all the flower-buds, water the plants when they require it, and attend to training the shoots to sticks as they advance in growth. Earwigs are already plentiful and searching for food; they prefer the fresh petals of the half-opened flowers, but failing these, they are content to nibble the young leaves. It is best to destroy them now, and thus save the flowers from injury. Plant cuttings in small pots, when they can be obtained.

POLYANTHUSES.

These are becoming great favourites, but many people fail to grow them well owing to improper management. They ought to be parted and replanted about the end of the present month, or potted if desirable. In doing this, replant deep enough to cover the young rootlets, which are produced an inch or more above the ground; they ought, therefore, to be planted about an inch deeper than they were before. These plants are frequently attacked with greenfly and red-spider, especially during hot weather. When parting the plants take a handful firmly by the roots, and dip the leaves in a solution of soft-soapy water and tobacco liquor.

KANUNCULUSES.

have suffered much from the dry weather, the leaves becoming yellow before the flowers were fully open; indeed, as I write—July 10—they are not more than fully in flower, with the leaves quite yellow. The tubers must be dug up before rain comes, else they would start into growth, and their flowering for next year be quite spoiled.

ANEMONES.

ought to be treated much in the same way as the Ranunculuses. They stand dry hot weather rather better—the leaves remain longer in a green state, but as soon as they take the yellow tinge of maturity the tubers should be taken out of the ground; and the best place to store them is a cool airy room, not a damp place where the atmosphere is close like that of a cellar.

TULIPS.

were taken out of the ground about June 20; the roots were not allowed to dry too much in the sun, but were placed—each variety—in a clean and dry pot, and the pots were placed on a shelf in the fruit-room. The room is dry and airy. We do not clean the roots until a few weeks before planting them out.

YELLOW CARNATIONS AND YELLOW GROUND-PICTOETES.

I scarcely touched upon this section of the Carnation and Pictoeet at p. 13, but it does seem that they are very popular. Their scarcity in the trade can be accounted for by the fact that after a few years' culture they degenerate and produce very few weak layers. The variety Prince of Orange (Perkins) is an exception; it has not degenerated to any appreciable extent, and I have grown it since it was first sent out twenty years ago, but I have grown it in pots. I do not think any of the yellow Pictoeetes are adapted for planting in borders out-of-doors, although some of the yellow selfs are hardier and endure the winter out-of-doors in mild winters. To be quite successful with any Carnations out-of-doors they ought to be thoroughly established before the winter. The best time to plant them out is about the end of September or not later than the first week in October. Messrs. Standish, of Ascot, sent out a yellow ground Pictoeet about the same time as Prince of Orange was sent out, but that variety degenerated, and has, I suppose, gone out of cultivation. Mr. Charles Turner, of Slough, raised a very fine batch of seedlings a few years ago from Prince of Orange, one or

two of them being superior to that variety. Ne Plus Ultra is very fine; they are all of vigorous constitutions, but do not succeed well unless they are grown all the year round in pots. All these yellow ground Pictoeetes have the fault of Prince of Orange—the yellow colour is not a deep rich yellow, but a pale yellow, or in some cases a straw colour. Some of the yellow selfs have a richer yellow colour, the best of all in this respect being Pride of Peashurst; it is also a vigorous grower, but is remarkable, and to many persons objectionable, on account of its total lack of perfume.

Mr. Turner had no less than thirty-four varieties of yellow ground Pictoeetes in his catalogue of 1881, but in 1885 not one was included, owing, doubtless, to the great demand for them, and the decline in vigour after a time. I grow still a few of the best of them; they are Alice, Flavius, Ne Plus Ultra, Princess Beatrice, Princess Marguerite, and Prince of Orange (Perkins). *R. Douglas.*

KANUNCULUSES.

A box of beautiful Ranunculus blooms reached me a few days ago, sent by Mr. Samuel Barlow from the bed in his garden at Shimdda Hir, Llandudno. Here in the fertile and rather stiff loam, mingled of course with which are certain ingredients favourable to the well-being of these beautiful flowers, the Ranunculus grows freely, and produces blooms of such exquisite and varied beauty that one wonders how it is the Ranunculus is so little grown in these days. Mr. Barlow still cultivates a collection of Ranunculuses; he has given up retaining them under name; the varieties are mixed together, and this blending of different forms does not in any way detract from the general effect. The flowers of the fine varieties in Mr. Barlow's possession are not so large as those grown by the Dutch bulb cultivators, samples of which were produced by Messrs. Paul & Son at a recent meeting of the Royal Horticultural Society, but they have a refinement and regularity of marking which do not appear in the Dutch types. Years ago the growers of these flowers, conspicuous among them the late Mr. Carey Tyso, took great pains to raise new varieties; and thirty years ago, even though the Ranunculus had then begun to decline in the public estimation, the published lists were formidable ones. Hundreds of these must have become lost to cultivation, and it would perhaps be difficult to find anywhere in the United Kingdom a collection of varieties grown under name as they formerly were.

The box of blooms from Llandudno contained about twenty varieties. One was almost white, of the most delicate cream shade; there were white with a slight edging of purple to the petals like that seen on a Pictoeet; one with a darker purple edging, and with more colour, also creamy-white tinted with rosy-pink; soft pink, pure yellow, yellow flaked with red sulphur, edged with crimson, bluish heavily edged with deep red, and the same flaked with red, also heavily suffused with the same colour, yellow, heavily edged with reddish-brown, rosy-purple, orange-red, &c. All the grounds of these varieties, and especially the whites and yellows, are pure, like those seen in the Pictoeetes. A few were of handsome self colours, but all beautiful, and among the choicest of hardy flowers, and yet they are sadly neglected.

To have good Ranunculuses they must be well cultivated, and this is probably one reason why they are not more grown. The general flower-loving public likes something that can be cultivated without much trouble, that is, when they have to do it themselves. A florist must needs be a "hobbyist," and ride his hobby hard, if he would be successful. A man who grows Tulips, Auriculas, Carnations, and Pictoeetes, Roses, &c., and aspires to have them good, must work hard and unceasingly in order to attain this end. The Ranunculus is no exception to this rule; it is one of those flowers that require a good deal of attention; but it is labour well invested. A good bed of Ranunculuses is an excellent return for some trouble and anxiety.

One who had essayed to grow Ranunculuses, and failed, mentioned the matter of his failure to the late Mr. George Lightbody, at the time when he was famous for the fine strain of Ranunculus he possessed; and said that he and others had given up their culture because they found it so difficult to get a fine head of bloom. Mr. Lightbody replied that to grow them successfully was a comparatively easy task, provided the following directions were observed:—The Ranunculuses must have something to live upon; in the

autumn throw out a trench from 1 foot to 11 inches in depth, according to the nature of the soil, putting at the bottom some well-rotted cow-dung, or old hot-bed manure, filling it up again with the soil taken out. In the month of February the bed to be raked very fine, and the roots planted 1½ inch deep, destroying all vermin, pressing the soil firmly about the necks of the roots, and then keeping the beds free from weeds, top-dressing occasionally with a little well decomposed manure.

The surface soil of a bed of Ranunculus should be kept firm; the old growers would walk through their beds treading the soil down with their feet. Then good waterings are necessary when the weather is drying. On no account must the plants suffer from want of moisture.

One most important point in Ranunculus culture is not to allow the roots to remain in the ground after the foliage has changed in colour. After this happens they get more harm than good. The roots should be taken up, carefully dried, and then put away in a cold dry place in paper bags, until required for planting another season. *R. D.*

TROPICAL FRUITS.*

AMONGST objects of productive industry receiving attention at present in our Colonial possessions, tropical fruits are at once the newest and most interesting of all. Many of these fruits are practically unknown in England in a fresh state, and hence before tropical fruits are largely consumed here, it is necessary to diffuse knowledge respecting them, and to render them as familiar to English home people as they are to their Colonial friends.

At the present Exhibition, owing to the suggestion of the Council of the Royal Horticultural Society, fresh fruits are shown from nearly every part of the British Empire. Thanks to the Colonial Market established in connection with the Exhibition, Oranges, Lemons, and Grapes are shown from the Australian Colonies; Oranges of several kinds from Natal, fresh Cocoa-nuts from the West Coast of Africa, Fine-apples from Antigua, Bananas from Jamaica, Naseberries (*Achras zapota*), Avocado Pears, Papaws, Bread-fruit and Limes from British Guiana; Melons from Barbados, Prickly Pears and Dates from British India, and most luscious Pine-apples from Singapore.

Although not exclusively a tropical fruit, the Orange is found and flourishes throughout the eastern and western Tropics. Taking this fruit as an example, it is remarkable what a large increase has taken place in the consumption of this fruit in the United Kingdom during the last fifteen years. In 1870 the number of Oranges imported into the United Kingdom was 80,000,000. In 1885 this number had increased to 500,000,000, or at the rate of fourteen per head of population. Dates are consumed to the extent of 5000 tons per annum, while Cocoa-nuts are imported by the shipload.

Being the nearest to England, as well as the most productive in the way of tropical fruits, the West Indian Islands naturally supply, and should supply, the English market more readily than any other. At the present day in the West Indian Islands the value of the fruit exported is nearly £400,000 per annum.

In Jamaica alone fruit is annually exported to the value of over a quarter of a million sterling—consisting chiefly of Bananas, Oranges, Pine-apples, and Cocoa-nuts. The Bahamas export chiefly Pine-apples, both fresh and canned, to the value of £50,000 per annum. Trinidad grows and exports chiefly Cocoa-nuts. British Honduras, connected by a mail route with New Orleans, exports Bananas, Cocoa-nuts, and Plantains to the value of £15,000 per annum. Montserrat is chiefly interested in Limes, and exports Limes and lime-juice to the annual value of £11,000. Dominica exports Limes, Tamarinds, and concentrated lime-juice to the value of £4000; while flat and sugary Antigua exports only Fine-apples, but those, though small, of very superior quality. From their geographical position it is only natural to suppose that a large proportion of the fruit of the West Indian islands finds its way to the United States and Canada, where there are nearly fifty millions of people, with all of whom fruit enters largely into their daily food.

* Abstract of a Paper read at a Conference held at the Colonial and Indian Exhibition on Tuesday, July 26. Mr W. T. Tusseion Dyer, F.R.S., C.M.G., in the chair.

The Banana (*Musa sapientum*) is the chief fruit at present cultivated in the West Indies, and this fruit is the one which in the future will be more largely offered in the English market than any other. There are numerous varieties of this fruit under cultivation, the Martinique Banana is found the most profitable to grow for export, although a smaller fruit, known as the Fig Banana, is more luscious and more highly esteemed locally as a dessert fruit. Jamaica exports Bananas to the value of nearly £200,000 per annum, and is capable of growing fully three times the quantity now exported without any diminution in the larger staples.

The Pine-apple (*Ananas sativa*) is no doubt indigenous in Jamaica, where an inferior kind, known as the "Cowboy macca," is still found wild. The Pine-apple is incorporated in the arms of Jamaica, and certainly nowhere, except perhaps at Pernambuco, can Pine-apples of such size and delicacy be grown as in some parts of this island. Antigua is noted for its Pine-apples, the pitch-lake Pine of Trinidad has at least a local reputation, but the Bahamas export more Pine-apples in the fresh and cured state than any other part of the world. The chief supply of Pine-apples for the English market at present comes from Madeira, the Canary Islands and the Azores. Should the interesting experiments now being carried on by Messrs. Scrutton & Sons, who have fitted up one of their ships with a refrigerating chamber, be successful, we shall before long have large supplies of Pine-apples direct from the West Indies, and at very moderate cost.

The West Indian Lime (*Citrus medica*, var. *acida*) is a fruit which is not much known in England. It is possibly little grown anywhere else except in the West Indies, where a large industry is arising in connection with the preparation of raw and concentrated lime-juice for the manufacture of citric acid.

The Mango (*Mangifera indica*) is the "Apple" of the Tropics, and is a most nutritious and wholesome food as well as a dessert fruit. Originally an East Indian tree, the Mango has become thoroughly naturalised in the West Indies, and is forming large groves in waste places in Jamaica, where negroes, horses, pigs, and fowls feed upon the fruits for nearly four months of the year. The West has given to the East the Anona fruits, known as Sour-sop (*A. muricata*), the Custard-apple (*A. reticulata*), Sweet-sop (*A. squamosa*), and the Cherimoya (*A. cherimolia*), but practically only the second and third appear to have become established in their new home. The Guava fruits (*Psidium Guayava*) are very common everywhere, and utilised chiefly for making the well known Guava jelly, and for flavouring cordials and syrups. The Litchi, Rambutan, and Longan of the East Indies are co-related by the Genip (*Genipa americana*) of the West Indies. The fruit of the spine-armed *Zizyphus jujuba*, allied to the "seductive-sweet fruit"—the Lotus of the ancient Lotophagi, has become cosmopolitan in its distribution, and will soon find its way to England from the West as well as from the East. The Passion-fruits are amongst the most delicate and refreshing of tropical fruits, and some of them have been successively introduced to England. The most common are the Grao-dilla (*Passiflora quadrangularis*), the Pomme d'Or or Water Lemon (*P. laurifolia*), the Sweet-cup (*P. edulis*), and the Calabash Sweet-cup (*P. maliformis*).

Of tropical fruits known generally as nuts, we have a long list, some of which are seldom seen in England. The Cocoa-nut is too well known to need description. It is computed that over three million acres of land are under cultivation in Cocoa-nuts in tropical countries, and the annual export value of nuts, oil, copra and coir is estimated at nearly two million and a quarter pounds sterling. The Brazil nut (*Bertholetia excelsa*) is obtained entirely from wild trees which are of immense size; and the same may be said of the Sapucaia nut (*Lecythis sapucaia*), and the Souari or Butter-nut (*Caryoca nuciferum*).

India is so badly off for fruit herself that she is not likely to be able to export any to this country; but the wild Apricot of the Himalayas, of the Punjab and North-west Provinces, is produced in such immense quantities, and so easily carried by simply drying in the sun, that it might be imported at a very low price. It is the Prunus americana of botanists, known in India as the Mish-mush or Moon of the Faithful. This latter appellation it has obtained from the fact that it is sometimes pressed out into sheets or "moons" and kept in that state until required for use. The delicious fruits of Singapore and the Malay

peninsula, amongst which the Mangosteen and the Lurian are the best known, are not likely to come direct from those countries. The former has, however, been fruited both in Trinidad and Jamaica, and large trees of the latter exist at these islands as well as at Dominica, Grenada, and St. Vincent. Hence West Indian Mangosteens and Durians are objects not impossible to be seen in England during the next decade. *D. Morris, Assistant-Director, Royal Gardens, Kew, July 21.*

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, JULY 21, 1886.

- July 15.—Dull morning; fine bright afternoon.
- 16.—A shower of rain in early morning; very fine morning; overcast in afternoon.
- 17.—Fine and bright in early morning; dull from 9 A.M.; rain about 11 A.M.
- 18.—Very fine day.
- 19.—A dull day; rain falling in afternoon.
- 20.—Very fine day.
- 21.—Very fine and bright till noon; overcast at times afterwards.

LONDON: Atmospheric Pressure.—During the week ending July 17, the reading of the barometer at the level of the sea increased from 30.15 inches at the beginning of the week, to 30.18 inches by 9 A.M. on the 11th, decreased to 29.48 inches by 9 A.M. on the 14th, increased to 29.81 inches by 1 P.M. on the 15th, decreased to 29.75 inches by 9 A.M. on the 16th, increased to 30.04 inches by 9 A.M. on the 17th, and was 29.99 inches by the end of the week.

The mean reading of the barometer for the week at the level of the sea was 29.58 inches, being 0.21 inch lower than last week, and 0.12 inch below the average of the week.

Temperature.—The highest temperature in the shade in the week was 73° on the 13th; on the 12th the highest was 66°. The mean of the seven day temperatures was 70°.1.

The lowest temperature was 49°.0, on the 11th, 13th, and 16th, on the 12th, the lowest was 57°.5. The mean of the seven low night temperatures was 51°.7.

The greatest range of temperature in one day was 24°.0, on the 13th; on the 12th the least, was 9°.0. The mean of the seven daily ranges was 18°.4.

The mean temperatures were, on the 11th, 61°.0; on the 12th, 60°.3; on the 13th, 59°.2; on the 14th, 59°.4; on the 15th, 58°.1; on the 16th, 59°.6; and on the 17th, 60°.2; and these were all below their averages by 1°.3, 2°.1, 3°.3, 3°.2, 4°.6, 3°.1, and 2°.5 respectively.

The mean temperature of the week was 59°.7, being 5°.6 lower than last week, and 2°.9 above the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun, was 134° on the 11th. The mean of the seven readings was 112°.9.

Rain.—Rain fell on five days to the amount of 0.97 inch.

ENGLAND: Temperature.—During the week end-

ing July 17, the highest temperatures were 74°, at Liverpool, 73° at Blackheath, 72°.5 at Brighton; the highest at Newcastle was 67°, at Nottingham 67°.5; at Wolverhampton 68°. The general mean was 70°.3.

The lowest temperatures were 39° at Sheffield, 43°.9 at Wolverhampton, 44° at Hull; the lowest at Plymouth was 52°.5, at Truro 52°, at Liverpool 51°.6. The general mean was 48°.2.

The greatest ranges were 30° at Sheffield, 26° at Hull, 24°.1 at Wolverhampton; the least ranges were 18°.1, at Plymouth, and 19° at Truro, Preston, and Newcastle. The general mean was 22°.1.

The mean of the seven high day temperatures was highest at Blackheath, 70°.1, at Brighton 69°.3, at Plymouth 68°.4; and was lowest at Newcastle, 63°, at Bradford 63°.6, at Liverpool 64°.4. The general mean was 66°.2.

The mean of the seven low night temperatures was highest at Plymouth, 56°.4, at Truro 56°, at Bristol 54°.8; and was lowest at Sheffield, 45°, at Hull, 49°, at Wolverhampton 49°.4. The general mean was 52°.

The mean diurnal range was greatest at Sheffield, 22°, at Blackheath 18°.4, at Hull 17°.4; and was least at Liverpool, 10°.2, at Bradford 10°.5, at Bristol, Preston, and Newcastle 11°.8. The general mean was 14°.2.

The mean temperature was highest at Plymouth, 60°.5, at Truro 60°.1, at Blackheath 59°.7; and was lowest at Sheffield, 51°.1, at Newcastle 55°.1, at Sunderland 55°.5. The general mean was 57°.3.

Rain.—The largest falls were 1.73 inch at Bristol, 1.38 inch at Brighton, 1.32 inch at Plymouth; at the smallest falls were 0.34 inch at Hull, 0.38 inch at Sheffield, and 0.68 inch at Nottingham. The general mean fall was 0.99 inch.

SCOTLAND: Temperature.—During the week ending July 17, the highest temperature was 70°.8, at Dundee and Aberdeen, at Greenock the highest was 64°.2. The general mean was 69°.1.

The lowest temperature in the week was 43°.0, at Aberdeen; at Leith the lowest temperature was 46°.9. The general mean was 45°.0.

The mean temperature was highest at Dundee 57°.1, and lowest at Greenock 55°.0. The general mean was 56°.3.

Rain.—The largest fall was 1.93 inch at Greenock, and the smallest fall was 0.25 inch at Edinburgh. The general mean fall was 0.87 inch.

JAMES GLAISHER, F.R.S.

SUMMARY OF TEMPERATURE, RAINFALL, AND DURATION OF BRIGHT SUNSHINE in the United Kingdom, for agricultural and sanitary purposes, for the week ending Monday, July 19, 1886, issued by the Meteorological Office, 116, Victoria Street, London, S.W.—The weather has been very changeable with one or two heavy falls of rain and frequent showers. Thunderstorms were experienced in the east and south of England on the evening or night of the 19th.

The temperature has been below the mean in all districts excepting the Channel Islands, the deficit varying between 1° and 3°.

The highest readings were observed in England and Ireland on the 18th, and in Scotland on the 19th, when the thermometer rose to 79° in the Midland Counties and "England, S.," and to 80° in "England, E.," The lowest of the minimum readings occurred either on the early morning of the 15th or 16th, when the thermometer fell to 41° in "England, E.," and "Ireland, S.," and to between 42° and 44° in all other districts excepting "Scotland, W.," where it did not go below 45°.

The rainfall has been everywhere more than the mean, and in the northern parts of Scotland and Ireland, and the Channel Islands, the excess has been considerable.

Bright sunshine has been less prevalent than it was last week, especially in "Ireland, S.," The percentages of possible duration have ranged from 12 in "Ireland, S.," to 30 in "Scotland, N.," and "England, N.W.," 46 in "England, S.," 51 in the "Channel Islands."

Depressions observed.—During the greater part of the week pressure was high over Spain or France, while numerous depressions passed over, or to the northward of our islands. The prevailing winds were, therefore, westerly. The only depression of importance which appeared was a rather deep system, the centre of which crossed Scotland on the night of

the 13th, and subsequently passed away in a northerly direction. As this came on, south-westerly gales were frequent on our west and south coasts, while in their rear a north-westerly gale was experienced in the extreme north of Scotland. Towards the close of the week the area of highest readings was transferred from Southern to Central Europe, the winds over our islands backed to the southward, and a series of depressions began to skirt our extreme western coasts. On the evening of the 19th a small shallow disturbance advanced with great rapidity from the South of France to our south-east coasts, and occasioned the thunderstorms referred to above.

Answers to Correspondents.

OUR TELEGRAPHIC ADDRESS.—Our correspondents are requested to bear in mind that our Registered Telegraphic Address is "GARDENERS' CHRONICLE, LONDON." Telegrams (but not letters) thus addressed will reach the Editor or the Publisher without other address being needed.

BLOOMS DROPPING FROM TOMATOES IN A COOL GREENHOUSE.—T. H. How can we tell? You furnish no particulars of the treatment given, nor any data whatever.

CAMPANULATE FOXGLOVE: A. R. Neither rare nor unaccountable. This common malformation, very often figured in these pages, turns up every year, and gives rise to the same unfounded suspicions. The first occasion was water-fighting in our September 5th, 1885. It is due to the union, in a very early embryonic stage, of several flowers which ultimately blend into one—a pluribus unum.

CORRECTION.—In report of the Royal Horticultural Society's show, in our last week's issue, col. a, p. 119 (Melon prizes), read for Pitman, E. G. Gilman.

CUCUMBER DISEASE: W. M. does not read his Gardeners' Chronicle very attentively, or he would know that figures and descriptions of the worms causing this growth have been repeatedly given. Turn out the soil, burn the roots, and start afresh.

GRAPES: J. B. Your Grapes are badly shanked, and there is no known remedy that will arrest its spreading through the bunches more or less. There are various reasons given for the appearance of the disease in vineries, such as over-cropping of the vines, deficiency of water at one time, succeeded by a deluge of water at a low temperature, the vine roots being at a great distance from the surface, unwholesome, close pasty soil; this last is frequently found where the berries shank badly, and there is a bad drainage, and a close and much moisture in the air of the house. Not giving air soon enough in the morning during the warm months is a fruitful cause of this injury to the berries.

INSECT: Gramplan. The insect sent is the Trichius fasciatus.

PEACH MILDEW: P. J. See Gardeners' Chronicle for July 19, 1886.

QUANTITY OF LAND PERMITTED TO PLANTED WITH TOBACCO IN GREAT BRITAIN: J. C. One square rod; the number of plants is of no consequence. Special arrangements were made in the spring of this year by which certain persons were allowed to grow more than this, so as to test the market value of, and the feasibility of growing, Tobacco grown in England.

MARÉCHAL NIEL AND GLOIRE DE DUJON ROSES: A Beginner. After the first flush of flowering some of the older shoots that have flowered very abundantly may be cut clean away, leaving the younger shoots of the current year; and the flowerless weak growths should be trimmed out, leaving no snags. These Roses produce the finest blooms from the ends of the shoots, therefore there must be no shortening back as is done with H.P. roses, and the points will flower better when not too rigidly tied to the trellis. Give plenty of water in dry weather, and manure-water occasionally. Give a mulch of short manure if it be not objectionable to the sight.

NAMES OF PLANTS: W. D. Tropæolum speciosum. Prince, Phloxina, Bougainvillea glabra. P. 7. Next week. Cos. P. Anemone hepaticoides. It is not a British plant.—Vane list, 1. Potentilla amiburg; 2. Cyananthus kenouense; 3. Thalictrum flexuosum.—E. C. 1. Galeopsis Ladanium; 2. Anemosa sempervirens; 3. Eriogonum umbellatum; 4. Epilobium latifolium; 5. Eriogonum frutescens; 6. Geranium nodosum.—H. Z. 1. Anagallis arvensis; 2. Echium vulgare; 3. Lychnis githago; 4. Tetraneura Scordonia; 5. Galium verum; 6. Erythraea centaurium.—H. J. 1. Rosa. Cattleya Eldorado—a good ordinary form.—Holt C. 1. Stanhopea Warlei. C. Cyrtopogon angustatus. Stanhopea exillimaria—Fid. variety; 4. Stanhopea sacata; 5. Odontoglossum maculatum; 6. Oncidium pretetatum.—A. C. Stanhopea churena.—Protogonistes. Asperula cynanchica. We can only suggest high manuring in addition to the manure you have adopted. Probably it was introduced with the seed.—D. Nigella hispanica.

STRIKING CUTTINGS OF CAMELLIAS: E. C. These can be put into sandy soil in pots, well drained, and planted in a shady spot under a frame or hand-glass, at any time during September. They will form a callus by the following spring, when they can be potted into thumbs and subjected to a very mild bottom-heat to induce them to form roots. Never let the soil in the pots become dry, and if a callus should become of a brown colour, throw the cutting away, as it will very rarely throw out roots. The cuttings must be protected from frost. The Camellia can be increased by cuttings taken off growing plants, in the months of March and April, and put into a sand bed covered with a mild bottom-heat of hot-water-pipes. They should be covered with a propagating-frame, and be kept in a moist genial temperature. The drainage under the sand should be good, when they can be abundantly supplied with warm water when necessary which will hasten the rooting process.

All communications intended for publication should be addressed to the "Editor." Such communications should be written on one side only of the paper and sent as early in the week as possible. Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

INTELLIGENT READERS, DO PLEASE NOTE.—Letters relating to ADVERTISEMENTS, or to the supply of the Paper, should be addressed to the Publisher, and NOT to the Editor.

FOREIGN SUBSCRIBERS sending Post-Office Orders are requested to send them to the Publisher of this journal, 41, Wellington Street, Covent Garden, and to them payable to William Richards, at the Post-Office, Drury Lane, London, W.C.

COMMUNICATIONS RECEIVED.—Sir W. C. B. (many thanks).—K. (many thanks).—A. M. G. (many thanks).—Next week.—H. G. (many thanks).—F. W. B. C. N. G. J. Woking.—Lucien Linden, Ghent.—The High Commission, Canada.—M. L. (many thanks).—L. (many thanks).—H. H. S. O. M. O.—M. G.—J. B. W. H. S. J. H. A. M. K. and A. L. (too late for publication).—E. T. K. (next week).—L. B. (see present issue).—A. D. J. V. & S. S. S.—N. B. J. K. S. D.

Markets.

COVENT GARDEN, July 22.

MARKET completely glutted with soft fruit, and prices are down all round. Strawberries falling off. James Webber, Wholesale Apple Market.

FRUIT.—AVERAGE WHOLESALE PRICES.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table with 2 columns: Plant name and price. Includes Aelia Sieboldii, Bedding Plants, Begonia, Bouvardia, Campanula, Carnations, Cornflowers, Daisies, Fuchsias, Hydrangeas, Lilies, Marigolds, Marguerite Daisy, Myrtles, Nasturtiums, Palms, Pelargoniums, Petunias, Rhodanthes, Fuchsia, Hydrangea, Lilies, Marigold, Marguerite Daisy, Myrtle, Nasturtium, Palm, Pelargonium, Petunia, Rhodanthus.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table with 2 columns: Flower name and price. Includes Arum Lilies, Carnations, Cornflowers, Daisies, Fuchsias, Hydrangeas, Lilies, Marigolds, Marguerite Daisy, Myrtles, Nasturtiums, Palms, Pelargoniums, Petunias, Rhodanthes, Sweet Peas, Tulips, Violets, Zinnias.

SEEDS.

LONDON: July 21.—Messrs. John Shaw & Sons, Seed Merchants, 37, Mark Lane, E.C., write that the markets continue quite of a holiday character. There is necessarily now an absence of the consumptive demand for Clover seeds, and, moreover, no speculation has yet sprung up. The quality of the new Trifolium is good, and prices are low; there is already a fair inquiry for this article. The recent welcome rains have greatly stimulated the demand for sowing white Mustard, and prices are, in consequence, rather higher. Rape seed remains unchanged. Hemp seed continues unprecedentedly cheap. In Canary seed the tendency is downwards. Feeding Linseed is steady. Blue Beans are still in good demand.

CORN.

MARK LANE: July 19.—For English Wheat, owing to the change in the weather, 6d. advance was obtained to-day. The official average for the kingdom fixed 3d. Hard foreign Wheats, suitable for mixing with damp samples of English, command more attention, but has not been much life in the trade. Flour was quoted firm generally, and country marks rather against buyers. Hops was very firm. Egyptian Beans advanced 6d. per quarter. Peas were quiet and unchanged. The trade in Oats was slow.

July 21.—Business was quite of retail extent in both Wheat and flour, and prices remained the same as on Monday. Barley was firm but quiet. Peas were quiet at late rates. Oats were taken off very slowly, but at about steady prices.

Average prices of corn for the week ending July 17:—Wheat, 22s. 4d.; Barley, 22s. 4d.; Oats, 22s. 4d. For the corresponding period last year:—Wheat, 33s. 11d.; Barley, 29s. 11d.; Oats, 22s. 4d.

FRUITS AND VEGETABLES.

COLUMBIA (East London): July 21.—Good attendance of buyers, and a brisk trade for a plentiful supply of vegetables, and a moderate one of fruit. Quotations:—Strawberries, 2s. 6d. to 4s. per bush; Raspberries, 3s. to 4s. per lb.; Cherries, 1s. 6d. to 3s. per half sieve; Black Currants, 2s. to 3s. per doz.; Red Currants, 2s. to 3s. 6d.; Green Gooseberries, 1s. 6d. to 2s. doz.; Pipe Gooseberries, 1s. 6d. to 3s. doz.; Peas, white, 1s. 6d. to 2s. 6d. per sieve; do., blues, 2s. to 3s. 6d. doz.; Broad Beans, 3s. 6d. per sack; Cabbages, 2s. 6d. to 6s. per tally; Lettuce, 4s. 6d. per score; Carrots, 1s. 6d. to 2s. 6d. per dozen bunches; 2s. 6d. to 4s. 6d. Parsley, 1s. 6d. to 2s. 6d. doz.; Turnips, 2s. to 3s. doz.; Onions, 4s. to 5s. doz.

STRATFORD: July 20.—The supplies during the past week have been good, and a fair trade was done at the following prices:—Cabbages, 5s. to 6s. per tally; Spring Onions, 4s. 3d. to 6s. per dozen bunches; Lettuce, 8s. to 10s. per score; Cucumbers, 3s. to 5s. per dozen; Carrots, 2s. 6d. to 4s. per doz.; Black Currants, 2s. to 3s. 6d. per sieve; red do., 2s. to 4s. doz.; Cherries, white, 2s. 6d. to 4s. per basket; ditto black, 2s. to 5s. doz.; Strawberries, 2s. to 4s. per peck; Marrows, 2s. 6d. to 3s. per dozen; Peas, green, 4s. to 5s. per bag; Gooseberries, 2s. to 3s. 6d. per half sieve; Beans, broad, 5s. to 6s. per bag; do., scarlet, 7s. to 8s. per bushel.

POTATOS.

BOROUGH AND SPITALFIELDS: July 20.—Moderate supplies and dull trade. Essex Kidneys, 6s. to 8s.; Jersey Kidneys, 5s. to 6s.; Jersey Kidneys, 5s. to 7s.; Cherboureg rounds, 4s. 6d. to 5s. 6d. per cwt.

COLUMBIA (East London): July 21.—Quotations:—Jersey Kidneys, 5s. to 5s. 6d.; do. flukes, 6s. to 7s.; St. Malo rounds, 3s. to 4s. 6d.; Cherboureg Kidneys, 5s. 6d. to 6s. 6d.; do. rounds, 4s. to 5s.; English Myatts, 6s. to 7s.; Shaws, 4s. 6d. to 5s. 6d.; middlings, 4s. to 5s. per cwt.

STRATFORD: July 20.—Quotations:—Jersey Kidneys, 5s. to 6s. 6d.; Cherboureg, do., 4s. to 5s. 6d.

Imports.—The imports into London last week consisted of 3318 packages Jersey, 19 baskets 9 barrels St. Nazaire, 183 baskets Cherbourg, 3561 packages 3096 cases 100 baskets Cherboureg, 530 boxes 601 cases Barleur.

HAY.

WHITECHAPEL: July 20.—Large supplies, with fair trade at steady prices. Quotations:—Clover, prime, 95s. to 105s.; inferior, 70s. to 85s.; hay, prime, 70s. to interior, 45s. to 65s.; and straw, 25s. to 37s. per load.

July 22.—There was a rather large supply on sale. The trade was steady at the annexed rates:—Prime Clover, 95s. to 105s.; inferior, 70s. to 95s.; prime meadow hay, 70s. to 95s.; inferior, 50s. to 70s.; and straw, 25s. to 37s. per load.

CUMBERLAND (Regent's Park): July 20.—A moderate supply, with but a slow demand for meadow hay and Clover. No trade for new hay. Quotations:—Clover, best, 90s. to 105s.; second, 75s. to 85s.; hay, best, 70s. to 95s.; second, 70s. to 80s.; and straw, 30s. to 30s. per load.

Government Stock.—Consols closed on Monday at 101½ to 101½ for both delivery and the account. Tuesday's figures were 101½ to 101½ in both cases. Wednesday's final quotations were 101½ for both delivery and the account. The closing quotations on Thursday were 101½ to 101½ for both transactions.

IMPORTANT TO GARDENERS.

FRANCIS & CO.

- 17.—Disinfecting Fluids, Special.
- 18.—Francis & Co.'s Insect Destroyer.
- 19.—Garden Tools of every description.
- 20.—Quotations for every requisite.

THE TRADE SUPPLIED

ADJUSTABLE ELECTRIC THERMOMETERS
For GREENHOUSES, VINERIES, CONSERVATORIES, FORCING PITS, INCUBATORS, and for FIRE.

TESTIMONIALS.

"Your Thermometers are now in all the Sheds, and to you are so indebted for uniformly strong and healthy Plants."

"Last night your Electric Tell-tale saved what is probably the finest house of Vines in the Kingdom."
"Your Electric Thermometer is a mighty good thing, and no Wine Grouver should be without them. Timely notice of approaching frost means the saving of perhaps a whole crop."

THE ADJUSTABLE ELECTRIC THERMOMETER

Is so applied, that when the temperature either rises above or falls below the degree at which it may be set, a bell is sounded or other signal given at however great a distance. Any number of Thermometers may be employed with the same Bell, so that every point can be under thorough protection at COMPARATIVELY TRIFLING EXPENSE.

FRANCIS AND CO.'S Thermometers are largely employed by Wine Growers in the open as well as under Glass, and are most valuable for Conservatories, Greenhouses, Forcing Pits, Hospital Wards, and in the process of Incubation.

Used throughout the Ostrich Farms of South Africa.

ADJUSTABLE ELECTRIC THERMOMETERS

Also form the most perfect PROTECTION AGAINST FIRE, the ever ready Alarm signalling the very first outbreak instantly.

Readily applied. Fitted with ease and certainty.

PRICES.

KENT PEATS or LOAM supplied at lowest rates in any quantities.
F. ROSHER AND CO.—Addresses see above.
N.B.—Orders promptly executed by Rail or to Wharves. A liberal Discount to the Trade.

Oil Paint no Longer Necessary.

HILL and SMITH'S BLACK VARNISH, for Preserving Ironwork, Wood, or Stone.

This VARNISH is an excellent substitute for oil paint on any outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of forty years ago by the Advertiser, and its genuine good quality, notwithstanding a host of unscrupulous imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requiring no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of most of the Nobility and Gentry, from whom the most flattering testimonials have been received.
Sold in Casks of about 30 gallons each, at 1s. 6d. per gallon, at the Manufactory, or 1s. 8d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL.

From ALFRED LOWE, Esq., The Rythe, Alderley Lodge.
"Some twenty years ago I used your Black Varnish, and shall be glad if you will forward me a cask, as I consider it the best thing known for the preservation of all outdoor work, either wood or iron, that requires to be painted."
CAUTION.—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.
Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine.
Large Illustrated CATALOGUE on Fencing, Hurdles, Field and Entrance Gates, &c., sent free on application to

HILL & SMITH,
Brierly Hill Ironworks, near Dudley;

WARNER'S Celebrated AQUAJECTS. Two Prize Medals awarded Calcutta Exhibition, 1883-4. Very easy to work, and the best implement of its type.

Numbers of Testimonials. Very simple and durable. Will wear for years. Price 30s.

Unsolited Testimonial. In use 20 years—it may last 20 more. Weston-super-Mare, T. J. WARNER & SONS, London.

From W. BROOKES (late Stephen Brown), Sec.-clerk, Nurseryman and Florist. Gentlemen,—I have sent per rail 30 Aquaject I wish thoroughly repaired except the spreader, I do not want that attached. I have had it in use constantly for just 20 years, with very little repair, which speaks well for it; and I think by thoroughly repairing now, it may last 20 more. Yours respectfully, (Signed) W. BROOKES.

JOHN WARNER AND SONS, Hydraulic and Horticultural Engineers, The Crescent Foundry, Cripplegate, E.C.; and The Foundry Works, Walton-on-the-Naze, Essex. Agents of every Farming and Ploughing in the Kingdom.

Wood

THE GENERAL WOOD COMPANY, Swedish Wharf, High Street, Peckham, London, S.E. Supply all descriptions of WOOD at Wholesale Prices for Greenhouse FRAMES, Manufactured DOORS, FLOORING, MILLWORK, SASH-BARS, RICKS and SCAFFOLD POLES, SCANTLINGS, and BOARDS. Manufactured to exact sizes, and prepared ready for fixing. Apply for quotations as above.

ANTHRACITE SMOKELESS COAL. The Gwaun-Cae-Gurwen Colliery Co. (Ld.), (late RICHARDS HUGHAN & SONS). Established Half a Century.

The largest producers of Anthracite Coal in the United Kingdom, supply the purest Anthracite for Horticultural purposes. COLLEBY OFFICE.—LANGLY, ST. MILES. London Offices and Depot 3, Mileage Station, Paddington, W.—The G. C. Co. will be pleased to furnish on application the names of Coal Merchants from whom their Coal can be obtained, as inferior Anthracite is often sold as theirs to unwise buyers. References permitted to some of the first Horticulturists in the country.

GLASSHOUSES & HEATING. B. S. WARRIORS. 31A, BEAUFORT STREET, CHELSEA, S.W.

PARTNER WANTED, in a genuine old-established Fresh Nursey and Florist Business, owing to a retiring partner. Capital required about £400; or the whole to be SOLD as a going concern.—Apply, personally or by letter, to J. C. JENNINGS, Priory Nursery, Canon Lane, Chiswick.

WANTED, a WORKING PARTNER, with Capital, in Nursey, Seed, and Fruit Business (Old Established), or with DISPOSE OF THE SAME at a valuation.—A. B. C., Mr. Robert Bull, Stationer and Photographer, Ashbourne

WANTED, a HEAD WORKING GARDENER, to take charge of the Gardens of a Country House, with 3 or 4 men under him. Must have had some years' experience (with good testimonials) in a place of that character. A particular knowledge and expertise in the Growing of Roses, and especially Roses under Glass, is required, also in the Cultivation of Herbaceous Plants. A good cottage with milk and vegetables, and the wages (5s. a week) would be increased if conduct satisfactory.—A. E., Eashing Park, Godalming.

WANTED, a competent GARDENER, able to take duties of Coachman. Must be industrious and total abstainer.—Apply by letter only, giving references, to DIXON AND CO., Nurseries, Auton Street, Hackney, E.

WANTED, a GARDENER—married, about 30 to 35—whose Wife will make herself useful in Housework and Poultry Yard. Wages 25s. per week, with house, coals, and gas. No children. Must be steady, obliging, and of good character.—Apply, with copies of testimonials, to N., Cowie & Co., 17, Gresham Street, E.C.

WANTED, a good SINGLE-HANDED GARDENER, abtainer; wife Laundress. Cottage found.—Full particulars to Mrs. GRAHAM LLOYD, West Felton, Shropshire.

WANTED, AT ONCE, a well recommended Man as FOREMAN (Indoors). Must have filled a similar situation, and be well up in his work. Good wages; both, &c.—A Journeyman left. None but good men need apply.—E. F. CROCKER, Ham Green Gardens, near Bristol.

WANTED, a WORKING FOREMAN, for a leading London Nursey; one who has filled a similar situation (married) preferred.—Apply, with references, and state wages, to HOBBS'S, Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

WANTED, an IMPROVER, in the Bulb Department. Good Penman and smart at Parceling.—Apply, stating wages, experience, &c., to THOMAS S. WALKER, Hale Farm Nurseries, Tottenham, London.

WANTED, a young Man for the Houses. Must be well up in Plant culture.—Apply, with particulars, to GARDENER, Ospringe House, Faversham, Kent.

WANTED, AT ONCE, as CORRESPONDING CLERK. Preference given to a man who can write Shorthand; must be a quick and neat writer. This is an exceptional opportunity for a man of good character, as the situation will be both comfortable, pleasant, and progressive one.—Apply in own handwriting, stating age, and giving particulars of engagements and salary required, to THOMAS WALKER, Hale Farm Nurseries, Tottenham, London.

WANTED, an INVOICE CLERK and CORRESPONDENT. Must write a good hand and be quick at Figures, and have had experience in the Seed Trade.—State age, where been employed, and wages required, by letter only, to H. W. CLARKE and SONS, 39, King Street, Covent Garden, W.C.

WANTED, an INVOICE CLERK. Must write well, be quick at figures, and have had previous experience in the trade as Clerk.—Apply, first by letter, stating age and antecedents to JOHN LAING and CO., Nurseries Forest Hill, E.

WANTED, AT ONCE, a young Man as ASSISTANT in a Seed and Florist's Business. Must be experienced in Wreath and Bouquet Making, also of good address, and attentive to customers. Wages to commence with 2s. per week.—Apply, with references, to H. W. CLARKE'S Chronicle Office, 41, Wellington Street, Strand, W.C.

WANT PLACES.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be filled in payable at No. 42, DRURY LANE, W. RICHARDS, as, unless the Number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE ORDER.

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeated Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.

Advertisements are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisement which they wish Repeated.

To Noblemen and Landed Proprietors. C. H. HAWKES, of Great Queen Street, Westminster, S.W.—Established over twenty years. PREPARES DESIGNS for Laying out New Gardens, Parks, Lakes, Roads, &c., or for improving old Grounds. Estimates supplied.

B. S. WILLIAMS begs to intimate that he has at present in the Nursey and upon his Register some excellent Men, competent either to fill the situation of HEAD GARDENER, BAILIFF, FOREMAN, or JOURNEYMAN. Ladies and Gentlemen requiring any of the above will please send full particulars, when the best selections for the different capacities will be made.—Holloway, N.

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners, seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

TO LANDED PROPRIETORS, &c.—A. MCINTYRE (late of Victoria Park) is now at liberty to undertake Formation and Planting of New Garden and Park Grounds, and Reclamation of Old Parks. Plans prepared. 115, Listeria Park, Stamford Hill, N.

GARDENER (HEAD).—Age 38, married, three children; twelve years in present situation. Satisfactory refs as to leaving.—GARDENER, Mr. Turner, Cranfield Court, Newport Pagnell.

GARDENER (HEAD).—MR. CHAPMAN, Gardener, Weston Birt, Tetbury, Gloucestershire, can with confidence recommend his Foreman to any Lady or Gentleman requiring the services of a competent man.

GARDENER (HEAD).—Age 30; fourteen years' experience in England and France; highest references as to character and ability.—W. CLARK, High Street, Higham Ferrers, Northamptonshire.

GARDENER (HEAD).—JOHN DERRICUT, for the last eleven years Foreman to the late Sir H. Edwards, Bart., C.B., seeks re-employment in good establishment. Thoroughly practical in all branches. Highest references.—Pye Nest, Halifax.

GARDENER (HEAD); near London preferred.—Thoroughly practical in all branches. Excellent character from Noblemen and Gentlemen. Good references as to ability GARDENER, 5, Rutland Street, Meopeler Square, Knightsbridge, S.W.

SHOPMAN (SECOND), or WAREHOUSE- MAN, or would take full charge of a Small House.—Age 24; through knowledge of the Trade in Vegetables, and Flower Seeds, Bulbs, and Sundries. Eight years' experience.—HORTUS, 65, Upper Sheriff Street, Dublin.

HOLLOWAY'S OINTMENT and PILLS.

Notable Facts.—Intense heat augments the annoy- ingness of skin disease and encourages the development of febrile disorders; therefore they should, as they can, be removed by these detergent and purifying preparations. In stomach complaints, liver affections, pains and spasms, &c., a single application will relieve, and the affected part immediately gives the greatest ease, prevents congestion and inflammation, checks the threatening diarrhoea, and averts incipient cholera. The poorer inhabitants of large cities will find these remedies to be their best friend when any pestilence rages, or when from unknown causes eruptions, boils, abscesses, or ulceration point out the presence of impurities within the system, and call for instant and effective curative measures.

Florists or Gardeners.

TO BE SOLD, a Plot of excellent LAND, Walled-in, and with Double and Single Gates, and the frontage of 95 feet 6 inches, and having a well-lighted Glass House, each 12 by 12 feet, and a 12 by 12 ft. glass-house. Highly adapted for horticultural purposes, or for the erection of a Villa residence.

Apply to HENRY BENNINGFIELD, Ware, Herts; or 16, Union Court, Old Broad Street, E.C.

FOR IMMEDIATE DISPOSAL, a FLORIST'S BUSINESS.—The Proprietor of a large and highly lucrative business, in full swing, which has been established for over twenty years, and is beautifully situated on the main road, Bayswater, near the present Water Hill, and commands the traffic from the principal entrance to Kensington Gardens, is desirous of disposing of the same. There is an unexpired term of fifteen years to run of the present lease, at an exceptionally low rental, and the trade return represents a large amount per annum. The books show various records of Royal patronage, and a clientele which includes a great number of the Nobility and Gentry of London, also of numerous Country patrons. To those seeking a good business this is cordially recommended as a first-class investment. It is especially suited to a partnership where the combined energies of two or more practical men would conduce to a great increase, as a large portion of the business is in Ball and Root finishing, and in the increasing demand for floral decorations for all seasons of the year. The whole stock, plant, goodwill, and lease, will be sold together as a going concern, as the Proprietor, being practically single-handed in the management, now finds it much too great a strain upon him, and he wishes to retire in consequence of ill-health. Further particulars will only be furnished to Principals or the Solicitor. Apply to J. A. KING, 20, Queen's Road, Hayswater, London, W.

To Florists and Others.—Chelsea. TO BE LET, a Large Walled Garden, GLASS, and GARDENER'S COITAGE. Apply to N. G. GODFREY, 13, Beaufort Street, S.W.

To Noblemen and Landed Proprietors.—H. HAWKES of Great Queen Street, Westminster, S.W.—established over twenty years—PREPARES DESIGNS for Laying out New Gardens, Parks, Lakes, Roads, &c., or Altering Existing Grounds. Estimates supplied.

To Landed Proprietors, &c. A. MCINTYRE (late of Victoria Park) is now at liberty to undertake the FORMATION and PLANTING of NEW GARDEN and PARK GROUNDS and REMODELLING existing GARDENS in every style prepared. 115, Listeria Gate, Stamford Hill, N.

CABBAGE SEEDS to offer:—

W. GORDON, IMPORTER OF ORCHIDS from ALL PARTS OF THE WORLD.—An IMMENSE STOCK of recently imported Plants compels a SALE of the Established Plants to make room. These have not yet flowered, but are all flowering plants, and must be sold at great sacrifice. VERY VALUABLE VARIETIES are certainly to be obtained, and great bargains; see Public Journals for high prices recently obtained. THE SPECIAL OFFER affords a PAINING INVESTMENT to any one with glass at command, which should not be overlooked. SUCH PLANTS may ever again be offered to the PUBLIC and the TRADE. Apply to W. GORDON, The Nurseries, Amyand Park Road, Twickenham, Middlesex.

Tree Carnations.

H. B. MAY invites an inspection of his immense stock of the above, in all sizes, consisting of Miss Jolliffe, Andromeda, and all the leading Tree Carnations, one of the most luscious ever offered. The Plants are full of bud, and in the most robust health. Also a quantity in 60's, fit for immediate planting. Silver Street and Angel Road Stations, G.E.R., are within a few minutes' walk of the Nursery. Dyson's Lane Nursery, Upper Edmonton.

J. JENSEN & CO'S
NORWEGIAN
FISH-POTASH MANURE.

Fish Manure is composed of flesh and bone—the best of
 all fertilising materials, and in combination with pure
 Salts of Potash and Magnesia forms a perfect fertiliser, as
 it contains the important ingredients of Ammonia,
 Phosphates and Potash in their most concentrated and
 available form. It is equally valuable for Farm Use, for
 Fruits, Flowers, and Vegetables, and produces wonderful
 growth, especially with Vines.

The Average Manurial Constituents are as follows:—
Cod Fish and Potash. Herring and Potash.
 Per Cent. Per Cent.
 7.0 Ammonia 8.30
 20.0 Phosphates 9.0
 15.0 Potash 15.0
 10.0 Magnesia 10.0

Or, in other words, a ton of **COD FISH and POTASH**
 is composed, approximately, of—
 10 Cwt. of Dried Fish Flesh—Organic Matter.
 4 " of Dried Fish Bone—Phosphates.
 Sulphate of Potash.

THE NEW PATENT TUBULAR
COMBINATION STAKE AND CLIP,
For Trees, Roses, Dahlias, &c.

(CARTWRIGHT'S PATENT)
THIS PATENT STAKE AND CLIP is at once simple, effective, durable, economical, and safe. It does away with the necessity of tying with string or grass; and when once the tree is fixed in position it is utterly impossible for it to get loose again by the action of the wind or weather; in fact, it must remain fixed in position until the gardener himself loosens it. Does not harbour insects and their eggs as do string and cloth.
The Stake itself is a wrought-iron tube, and is made in various lengths, from 3 feet up to 7 feet 6 inches.
The Spring Clips are supplied in various sizes, of 1, 1½, and 2 inches across the ring when shut, and are coated with soft indiarubber.
Light Brass Caps are also supplied when required. These Caps are fixed on the top of the tube to keep the rain and earwigs, &c., from getting in it.

We can also supply these

STAKES ADAPTED FOR RASPBERRY CANES

WHEN GROWN IN CLUMPS.

These Stakes are supplied with two large Wire Clips, one on each side of the Stake, as shown in sketch.

MAY BE OBTAINED FROM ALL SEEDSMEN, &c.

F. SANDER, ST. ALBAN'S.

THE
Gardeners' Chronicle.

SATURDAY, JULY 31, 1886.

LETTUCES.

DURING the present generation almost all garden vegetables and flowers have been greatly modified, and as we may well say, improved, since their usefulness and beauty have been very much increased. Years ago, before the modern horticultural epoch had commenced—before the days of great seedsmen and nurserymen—the forms of Lettuces were few, and they remained in season only a short time. We had a best sort for standing the winter, coming into use tolerably early in the spring, and a best sort for the summer, but the season was soon over. In this, as in other respects, the Lettuce has been greatly altered, and it has become a much more useful vegetable than it was of old.

Its forms are now so numerous that sixty-five varieties, including all the leading forms, and several sorts which as yet await the verdict of experience on their qualities, were grown this season in Messrs. Sutton's trial grounds at Reading. The seed was all sown on the same day, and on July 15 the earliest sorts had already quite "run away," while the latest were just coming into season. This is a great improvement, and it is not too much to say that there are Lettuces now which may be made available for every period by changing the times of sowing and, in the winter months, by the aid of glass. But besides the different habits of maturing much else has been evolved by selection. On these and other points a most useful and indeed a wonderful lesson may be read in the trial grounds of our leading seedsmen.

Lettuce seed is grown in different districts to prevent mixing; for the Lettuce resembles the Cabbage tribe in cross-breeding freely if the varieties are not kept wide apart. Formerly, when our summer sun was more reliable than it has been lately, the Lettuce was seeded in England; the seed has since been grown—say for ten years past—almost entirely in France. An effective hold is kept on the reins of this important branch of a seedsman's business in this way. A pinch of seed from each grower is sown in the trial grounds. A grower may be a breeder and selector, and presently, perhaps, he evolves something new. There can be no such thing as the best all-round Lettuce. Commodore Nutt may be the best early sort, which you may plant 4 inches apart, and have delicious little Lettuces the size of cricket balls. It is like Tom Thumb, or Sutton's Golden Ball, an incomparable Cabbage Lettuce of the dwarf section. Other sorts have other qualities, and when we pass to the Reading Mammoth White or the Champion Brown we reach, one might say, quite another world; for, apart from other differences, these are Cos Lettuces, upright in their habit of growth instead of being round like an ordinary Cabbage Lettuce. But the breeder claims an improvement, and sends some seed, which is at once subjected to the test of the trial-ground.

The 160 plots of Lettuces grown here are all

DANIELS BROS. - Town Close Nurseries, Norwich.

numbered, and each number, with full historical and other particulars, is entered in a large book like a merchant's ledger. "What is this?" we ask, noticing a plot of curious blotched Lettuce. We are at once told the whole story. It is a Lettuce with leaves splashed with stains like those of the spotted Orchis. It was sent from Italy on trial, and must be discarded, however excellent, on account of its objectionable colour.

Of course the testing plots exhibit both defects and excellences, in whatever degree they may be exhibited, and the expert who makes himself responsible for the credit of his firm in this department proceeds to France to inspect the seed crops with the lessons of the "ledger" impressed upon his mind. This year an older expert accompanied the younger one, and he mentioned to the writer that he had been reading the lessons of the trial grounds for the last thirty years, and they still possessed their former interest. Studies of this kind create enthusiasm, and lead on to the knowledge and success which various firms possess in different departments of horticultural enterprise.

In the course of a walk along the long border of trial plots devoted to Lettuce we noted down anything that caught the eye, and although we cannot hope to exhaust the list of superior Lettuces, or to describe their diverse merits within our allotted space, we shall at any rate inform the reader of several facts, which he too may obtain by the simple process of sowing for comparison next autumn and spring several sorts of seed. Perhaps he may like mixed Lettuces, for there are buyers of such, and in the salad season of next year the pricked-out plants, true to their kind, will bring a succession from the same bed. The old adage, "Tell me what company you keep and I'll tell you what you are," does not apply to Lettuces, whose individuality is stamped upon them so indelibly by Nature's law and the selector's art as to be utterly unaffected by companionship.

Most persons will prefer to sow their Lettuces separately. There are three or four sorts, each excellent, as the experts assure us, and as they are all the smallest, earliest, and most dwarfed of the Cabbage or spreading section, they are specially suitable for forcing. So you will sow for that purpose Tom Thumb, Early Dwarf, Marvel, and Commodore Nutt, which last is well known for its delicious nutty flavour. In fact such Lettuces as are now produced should not be mixed together promiscuously, but sown separately and their differences observed. Among those beautiful small Lettuces which have won such favour lately, Golden Ball is unrivalled for early forcing and summer use, says the thirty years' student—and his knowledge must be complete. Its habits are excellent, for it does not run quickly to seed and it may be left thick in the rows. "We absolutely gathered them by the bushel," writes an enthusiastic gardener, and then follows a minute description of the peculiarities of this "crisp and tender Lettuce," whose golden colour is another of its attractions. In regard to colour, Blonde de Berlin, which is popular in Germany, is the palest yellow we met with in the whole field, and recalls very agreeably the colour of a sovereign. The last of the Cabbage Lettuces which we shall very briefly mention is Standwell, a sort which does stand well, running late to seed, besides possessing other merits.

Other sorts, novel or otherwise, are The Queen, partaking of the character both of a Cos and Cabbage Lettuce, and which requires tying, when it becomes exceedingly tender. All the Year Round is a well known sort standing the winter well and lasting a long time. Drumhead is, as the name indicates, a large Lettuce; Neapolitan Drumhead is similar to it, but darker in colour. A well known and widely distributed sort is the Hammersmith, a good

winter Lettuce for sowing in July and early in August, and largely grown for market.

We now pass on to the Cos tribe, and here our friend the old expert, with due reverence for the reigning king of the Lettuces, remove his hat to Sutton's Mammoth. So large—the biggest of the Cos Lettuces—and yet so crisp and tender! Not one of the Cabbage tribe is so tender as this. "A grand summer Lettuce," says a well known correspondent of the *Gardeners' Chronicle*. Mr. Rust, of the Eridge Castle Gardens, and another good gardener and correspondent, Mr. Miles, of Wycombe, says that in the peculiar property of withstanding drought and hot weather it excels all the other sorts that he tried against it. But here is another sort that takes the eye, and the Paris White is still more tender, it is said, smaller, with a good heart. As sometimes happens in inspections of this sort, time is up, and we must now touch upon the other plots very lightly. Here is Brown Cos, rather later than either the White or Green Cos, and it does not run to seed quite so soon. Recognition is passing of Sutton's Winter White, an exceedingly hardy, valuable sort, large, with every merit, including flavour, and one of the very best sorts whose history is written in the expert's "ledger." This that follows is the All Heart, a very compact good sort, with this distinction, that it sometimes weighs 6 lb. to 9 lb., and claims to be the biggest hearted Lettuce. The Green Ground Cos has the peculiarity of growing close to the ground. It is dwarf and compact, with pointed, dark green leaves, and is excellent for forcing. The last on our list is the old Black-seeded Bath, one of the oldest sorts, exceedingly hardy, and requiring a little labour, which in many sorts is avoided, since its habit of growth is open, and it must be tied.

There is always novelty in an inspection of this sort which can never fail to increase one's respect for the experts and one's desire that success may still attend them. *H. E.*

New Garden Plants.

MR. HILL'S MAUVE CATTLEYA.

MR. C. G. HILL, Arnot Hill, Nottingham, has kindly sent me, through Mr. J. C. Stevens and Mr. Harry Veitch, the "blue or mauve Cattleya." It is well known that the "blue Cattleyas" are now expected by some lucky enthusiasts from the Congo! and we expect that Lissobulus and Angreca, are among the most cherished of dreams, matching the blue Roses of the Rhododendrons.

The plant of Mr. C. G. Hill is a zephyrian beauty. It has a short furrowed bulb, a broad, shining, fine leaf and flowers, which I compare to the original flowers of Cattleya labiata Roezlii, as they are in my herbarium widely distinct from the few fresh ones I saw under that name. The petals are rather broad, yet by no means in the way of those of Cattleya Trianae. Like the sepals, they have a light hue of a certain light purple passing into light mauve, apparently more so when fading; and so is the anterior part of the wide lip. There is the swallow-tail yellow mark of Trianae, wherein the two rows of superposed narrow, oblique yellow lines go from disc to base. Column strong, white. Vestiges of only one spathe. I hear there were four flowers.

Of course such a Cattleya, lovely as it is, purchased as an imported plant of uncertain origin, cannot be satisfactorily named from two flowers and a bulb. For such cases of obscure individuals, unavoidable in consequence of the immense importations that take place, the system advocated by Dr. Masters should be thankfully followed. It is quite a refreshment, a benefit, a consolation, to avoid the direct naming of such an individual plant [in botanical form]. *H. G. Rehb. J.*

PORTULACA SOMALICA, *N. E. Brown, n. sp.*

Plant 8—10 inches high, quite glabrous, except in the axils of the leaves, and at the base of the flowers, where there are some whitish hairs, those in the axils of the leaves being 3—4 lines long, and conspicuous, those at the base of the flowers very short and inconspicuous. Stem fleshy, terete. Leaves fleshy, subterete, spreading, slightly recurving towards their tips, 2—1½ inch long, 1 line thick, the shorter ones acute, sub-mucronate, the large ones very acuminate. Involucere of four leaves, longer than the flowers. Flowers in terminal clusters of three. Sepals ovate-acute, persistent, submembranous, tinted with pale reddish, 4 lines long, 2—2½ lines broad. Corolla an inch in diameter, bright light yellow inside, pale pinkish outside; petals contiguous, and overlapping each other, ovate-acute, 7 lines long, 5 lines broad. Stamens numerous, filaments yellow in the basal half, orange above; anthers and pollen yellow. Stigmas six (always (?), only one open flower seen), yellow.

A native of Somali Land, East Tropical Africa, where it was collected by Messrs. James and Thrup, who presented it to Kew, where it flowered in May of this year. It is allied to the West African *P. foliosa*, Lindl., but is readily distinguished from that species by its more pointed leaves, with long hairs in their axils, by the absence of a dense mass of woolly hairs at the base of the flowers, and especially by the broader, overlapping, acute petals, which in *P. foliosa* are narrow, distant, and emarginate. *N. E. Brown.*

NEUMÜNSTER, ZURICH.

MESSRS. FRÖBEL'S NURSERY.—Alpine plants!—who does not love them that cares for a flower at all? It is not only because of the vividness of their colours, and the variety of their forms, but they are reminiscent of the mountain breeze and the glittering snows, and they quicken reminiscences of many a long expedition and happy climb to their peaceful solitudes.

Of course it is best if it be possible to look for them in their own native habitats. To say nothing of the fact that many alpine flowers should be seen in great breadths if they are to be appreciated at all, it is well to study their own way of growth, and they look infinitely better when they are set off by their natural surroundings than they ever can appear in any other way. But short of this, where can a few hours' instruction and gratification be better found than they can be in a good nursery garden? And such an one I met with at Zurich when I was visiting the place. M. Fröbel had been known to me, through correspondence and by his plants, for years. I was glad at last to make his personal acquaintance, and to inspect his treasures. From one point of view, a walk round his garden is more remunerative than a visit to any alpine district can ever be. He draws upon so many mountainous regions in Europe and other parts of the world that alpine plants are focussed here, if I may use the expression, and you can take them all in at once. A very rare Saxifrage and one of the most beautiful of all—*Saxifraga catalanica*—from the mountains of Catalonia; *Omphalodes Lucilii*, from Mount Taurus in Asia Minor; *Gentiana bavarica*, *Ranuncula pyrenaica* (both the white and blue varieties), *Silene Elizabethae*, and other gems from the Apennines; from the Tyrol, from Switzerland, from the Pyrenees, and many more places where these things can be found, meet together here, and can be studied in unison. And there is more to be thought of than this by the grower of alpine plants. It is undeniably true that any of these alpine favourites which are raised from seed or grown on from cuttings and are afterwards judiciously moved in the borders from time to time are much more likely to do well than the original plants, which were taken from the mountain side, and are then reduced to captivity. The constitution of the seedling or the cutting becomes improved, and they have no reminiscences of other days to keep them back; they take to their enforced conditions at once. This is the great and special advantage which the nursery of M. Fröbel presents. Difficult and tender plants which come from him have a good set-off at the beginning. They are likely to do well where anything of the same sort will succeed. At Neumünster I met with three plants which are so infrequently to be seen that they

would by themselves repay a long pilgrimage at once. They were all in a flourishing condition, and to meet with these three in one place was quite an event. Their names are these:—*Saxifraga florulenta*, *Dianthus neglectus*, and the third, which of course makes no pretence to being an alpine, is *Rosa berberidifolia*. Not one of these in anything like good condition have I ever seen before; they are all apparently doing well under M. Froebel's care.

Saxifraga florulenta has been with me for a long time like a vanishing Will-o'-the-wisp. I believe it can be grown in England, and I have occasionally heard of it in one place and another, but it has always been my lot to hear where it has been, and never until now to see it where it is. At Neumünster, in two or three places, it seems to be quite established, and to be very happy. Of course it is grown horizontally, and in the chinks of a rock, and from its flourishing appearance no one would judge that it is a misty subject at all. I was sorry to hear that M. Froebel that it is fast becoming excessively scarce in its own native habitats. What a pity it is that so many good things seem doomed to extermination, and the rarer they are, and the more precious, so much the faster does their destruction come upon them. In this case it would appear that botanical collectors are especially at fault. Who would not like to have *Saxifraga florulenta* that cares for an alpine at all? This seems to be the only thought that is entertained—then let it be pulled up ruthlessly, and scattered here and there remorselessly; and thus they are going on, so that very soon the inaccessible crag will be the only spot where this precious *Saxifraga* can abide.

I was glad to meet with *Dianthus neglectus* at last, undeniably true. How often has its counterfeit been made to do duty in its stead? Not that any fault can be found with *Dianthus glacialis*; it is pretty enough, but then it is not *neglectus*, and one should not be passed off for the other—they are very plainly distinct. I think Mr. Wally Dod (to whom we are all so much indebted) called attention to this in your columns some little time ago. He was perfectly right in what he said, and *Dianthus neglectus* (true) quite bears him out. It differs from *glacialis* in its height of about 5 inches, and also it is of a more slender habit, and beyond everything else it conspicuously differs from it in the fact that the under sides of the petals are yellow, and they almost look as if they were covered over with gold dust. There is no chance of any further confusion when the right thing has at last been discovered. *Rosa berberidifolia* was grown from seeds which were sent direct from Persia. Herr Max Leitchlin informed me the other day that this was the only chance of getting it to do well. He raised some plants in this way a little time ago, and one of them did well for a time, and was the glory of his garden at Baden-Baden; but, alas! like so many other triumphs in other parts of the world, it went off, and now it only lives in remembrance.

It remains to be seen how long M. Froebel will be able to say that he is the possessor of this glorious rose, but it is certain that he has it now, and it looks as though it would live with him. May it be so, indeed, and when next I go to Zurich may *Rosa berberidifolia* appear in all its beauty, naturalised and quite content in his garden, and no longer a stranger in the land. It is odd that a Rose which grows in thousands in the shifting sands of Persia should be so excessively difficult to handle elsewhere. The soil, we are told, is quite matted with its roots in some parts. Why should it not bear transportation as *Iris Susiana* does bear it and other good things as well? There was one little gem which caught my eye at once on M. Froebel's rockery, and which must have a word of praise. I refer to *Alsine verna flore-pleno*.

Alsine verna is common enough, and the pretty green cushion with numerous white flowers is most recommendable; but *Alsine verna flore duplici plenissimo* is an unheard-of variety, of very great merit, and entirely new. M. Froebel met with it in only one instance on the mountains of Engadine; his quick eye told him at once what a treasure he had come across, and he has gone on practically increasing it till now, it may be hoped, it will never be lost to the world. Each flower (to use M. Froebel's own words) is formed of two very double flowers embraced one in the other in the way of *Primula* Hoop-in-hose, but with the difference that the inside flower has conserved his green calyx. There are most charming little heads of the purest white studded over a carpet of the most brilliant green. *Alsine verna flore-pleno* is a plant which is

very much to be desired. A white form of *Ramondia pyreica* is sent out from this nursery. It came originally with the ordinary blue sort, but it far transcends it in beauty, and is considered to be one of the very finest of all alpine plants. *Ramondia serbica* and *R. Nuttaliae* are also growing by its side, and are very worthy companions of it.

On the rocky *Lithospermum petreum* and *L. graminifolium* called for instant attention. They are much alike in blossom, and differ only in habit; the latter is more low lying but of an equally intense blue colour. I am assured that they are both quite hardy; and daintier, prettier little plants could hardly be imagined than they are. *Potentilla speciosa*, from the Lebanon range; *Oenosis fruticosa*, *Helichrysum frigidum*, from Monte Rotundo, Corsica; *Daphne Philippi*, from the Pyrenees; *Dianthus cionabarius*, from Greece; *Lithospermum oleifolium*, from Persia; *Eriogonon hispanicum*, *Dianthus spissosus* (of which M. Froebel possesses only a single plant), *Vella spina*, from Spain; *Iberis saxatilis*, *Hypericum cuneatum*, *Saponaria pulvinaris*, and several others besides, have found their way into my note-book; but I think I have said enough to show what an interesting nursery this is, and especially in the way of alpine rarities. Many other plants might of course, be noticed as well. Perhaps M. Froebel sets as much store on a glorious red Water Lily (*Nymphaea alba var. rosea*) as he does upon anything else in his possession. It is indeed very fine, and of a dark red colour. It is a great improvement on the scarce red Water Lily, and it is only a pity that such good things are so often difficult to increase in stock.

Large glasshouses were full of *Begonias* and such like; but I could not pay any attention to them. Let those who can tolerate bedding-plants where alpine can be seen instead of them go where I failed to go. I was surfeited with Flora's choicest gems—they put clean out of sight, in my mind, for the time being, everything else besides themselves. It just remains to be noticed in these rough notes that M. Froebel, who is such a very successful grower of alpine plants, does not trouble his head much about the chemical composition of the compost in which he grows them. He does not pretend to any nice imitation of the soil in which his plants originally were found. Peat and sand are his staple commodities, and with these he is generally content. *A Wanderer*.

THE SEED TRADE.

TIME OF SEED SOWING.—A series of visits paid to different parts of the country where the growing crops can be seen has led to my noticing one peculiarity as a prevailing feature of the season, and as throwing light on the subject of the time of seed-sowing. The unpropitious weather in the early part of the present year necessarily prevented in great part the usual practice of early sowing for main crops of most sorts of vegetable seeds, and the greater portion of these were not placed in the ground until the end of March or the beginning of April—decidedly later than is usual. Some might be led to think this a matter for regret, but all through the country there is a general appearance of excellent crops, secured from one sowing, with scarcely an appearance of failure.

This fact seems to point a moral to the effect that, having regard to our uncertain and precarious springs, early sowings for main crops are not desirable. More than that, past experience has shown in many instances that too early sowings frequently end in disappointment and loss. Of course it is only natural that growers for market will risk a crop for the sake of obtaining a first consignment that will command extra prices; but they know their risks, and if a particular crop falls a succeeding one is at once sown. A private grower who depends upon his main crops for the season's supply can hardly venture to be so daring.

I know an old grower who for thirty years past has never failed to sow his main crop Peas in April, and he has never failed to secure a good produce. On the other hand, I have known many to hurry in their seeds the first fine day or two in February, and have often had to sow again a month or two afterwards, thus losing seed crops, and having to incur additional expense in the way of labour, besides loss of time. In such cases when a burst of fine weather in February has induced the grower to sow, and failure has followed, the season is blamed as being unkind and killing. This year early sowings

were in most instances impossible, and many a grower, looking upon luxuriant crops, has bled where in other seasons he has been ready to cure. The seeds and the seedmen are often blamed, but the too anxious sower should have a large share of it.

Many gardeners, and especially those who may be termed amateurs, appear to labour under the delusion that early sowing necessarily means early crops. The experience of a thoroughly competent judge is to the effect that the end of March is soon enough to sow Peas, Beans, Parsnips, Onions, Leeks; Cabbage, Kales, Cauliflowers, Broccoli, and Brussels Sprouts; while Beet and Carrots should not be sown until April, as they are apt to run to seed when sown earlier, and the roots are thereby rendered useless.

Some blame is rightly due to the recommendations of seed catalogues. If any one will look over the directions running through these they will find that almost everything in the way of seeds is recommended to be sown at the earliest time, and the effect of the advice appears to have been to encourage some to sow even before the time named. Probably the intention is to give a kind of starting-point when sowing should commence, with the margin of three weeks or a month in reserve to do it in.

The foregoing remarks are intended to apply only to outdoor main crops. But some of your correspondents must have had considerable experience bearing upon the subject of early versus late sowing, and if they can be induced to give it it will no doubt prove helpful in reaching something like correct conclusions. *Fium*.

WHERE TO FIND ALPINE PLANTS.

THE Pennine or Valaisian Alps are, together with the Upper Engadine, the richest parts of Switzerland as to their flora. Some few hints to intending tourists may, therefore, be acceptable. Of all the Valaisian Alps Zermatt possesses the greatest attraction, the most beautiful landscape, and the richest flora. Of all the Swiss cantons the Valais has the richest and most characteristic flora. Haller called it with reason the Spain of Switzerland. It is a country remarkable on all accounts, and nowhere else can be found within so limited a space a more striking contrast than that which is presented to the eye on passing from the Bernese Oberland to the Rhone valley. It is the sky of Italy after that of the icy meadows of the North. It is the flora of the South succeeding that of Lapland.

The vegetation of the Valais is that of the border of the Mediterranean. All these barren slopes, burnt up in autumn by the sun, are covered with a vegetation different from that of the rest of Switzerland. There are numerous *Artemisias*, of which *A. valesiaca* (Allioni) is characteristic, not being found elsewhere. *Sempervivum arachnoideum* form immense patches covered with white cobweb-like threads with which the red blossoms contrast effectively. *Opuntia vulgaris* covers the rocks in the vicinity of Sion in company with *Ephedra helvetica* and *Clypeola Ionthalpi*. *Iris germanica* is so abundant that the rocks over Sion are in spring enveloped with the flowers; here also are found *Iris viridescens* and *Tulipa ocalis solis*. Among other plants of the Rhone valley may be noted *Juniperus Sabina*, *Oenosis columnae*, *O. natrix*, *Astragalus monopetalus*, *Oxytropis Halleri*, *O. pilosa*, *Astragalus Onobrychis*, *O. arenaria*, *Kentiophyllum lanatum*, *Lactuca viminea*, *Silybum Marianum*, *Hieracium lanatum*, *Aschillea tomentosa*, *A. nobilis*, *Lolium multiflorum*, *Ruta graveolens*, *Vicia major*, *Lichens coronaria*, *Silene arenaria*, *Calepina Corvini*, *Clematis recta*, *Euphorbia Gerardiana*, *Anemone montana*, *Stipa pinnata*, *Gagea saxatilis*, *Ceterach officinarum*. The Almond grows wild (?) on the rocks of Saillon near Sierre, where also *Pomegranates* may be found. This vegetation is very different from that of Canton Ticino, for while in the Canton Tessin the plants are tall, robust, bright green; in the Valais the foliage is stunted, grey, covered with woolly down. In Tessin the plants are full of sap, and respond to the humidity of the air and soil; in the Valais the dryness of the air and the force of the wind are denoted in the character of the vegetation.

THE VAL D'AOSTA

has many analogies with the Valais, and on that side of the Alps, as on the other, the base of the mountains is dry and arid, and possesses a similar

flow. But what a difference becomes apparent as one mounts the immense mountains which separate the two valleys. On the Furca and on the Simplon the rocks are carpeted with *Mathiola valesiaca*, *Saxifraga corydendron*, and *Asplenium septentrionale*.

ZERMATT.

If we go to Zermatt we find another change. There we do not take two steps without finding something new. Ten minutes above the village, along a path which starts from the English church, may be found *Viola pinnata*, *Silene valesiaca*, *Thalictrum minus*, *Alyssum alpestre*, *Stipa pinnata*, *Astragalus Leontopis*, *aristata*, *excuspus* and *monosperulus*, *Oxytropis Halleri* and *Lapponica*, *Gnaphalium Leontopodium*, &c. To the left of the village, and on the borders of the cascade, which falls from the Findelen glacier, is a rich station for *Aquilegia alpina*. Higher up are found *Primula longiflora*, *Gregoria Vitaliana*, *Gentiana purpurea*, *Chamaeorchis alpina*, *Lloydia serotina*, *Gagea Liottardi*. In ascending to the Riffel, in the forest of *Pinus Cembra*, may be found *Gentiana purpurea*, *Clusii*, *Rhododendron ferrugineum*, &c. If, instead of following the ordinary path, the tourist goes to the right along the ravine, the most characteristic plant of the district may be found; this is *Anemone Halleri*, which is only found in the upper part of the valley of S. Nicholas. It is probably only a form of *A. Pulsatilla*, but has a very large corolla, velvety on the outside, dark blue inside, and with a dense tuft of yellow stamens. Its deeply-cut leaves are densely covered with a silky white tomentum. It is a superb plant, which should be generally cultivated, as it succeeds well in cultivation, and is very effective. It is easily raised from seed. In its native locality it grows in light sandy soil, fully exposed to the sun. Near the Riffel large patches of *Colchicum alpinum* may be seen. This is also a special Valaisian plant, not being found out of the canton. Then there are *Anemone vernalis* and *Baldensis*, *Saussurea alpina*, *Ranunculus pyreneus*, *Phyteuma hemisphaericum* and *P. pauciflorum*, *Lychnis alpina*, *Gentiana purpurea*, *punctata*, *bavaria* and *brachyphylla*. In ascending from the Riffel to the Gorner Grat, *Aretia Vitaliana*, *Androsace carnea*, *A. glacialis*, *A. imbricata*, *A. obtusifolia*, *A. septentrionalis*, *Senecio uniflorus*, *Ajuga pyramidalis*, *Alpinia urticulosa*, *Linnia alpina*, *Ranunculus parassifolius*, *R. rotifolius*, *R. glacialis*, &c. On passing over the Theodule to Breuil may be found the famous *Saponaria lutea*, *Saxifraga retusa*, and *Sempervivum Gaudinii*.

THE VAL D'ANNIVIERS,

which is reached either by the Col de Meiden, or by the Trifjoch, is of richness nearly equal to that of Zermatt. Up to the present, this valley has been less frequently visited than that of Zermatt, Saas, or S. Nicholas, but since the Grand Hotel Weisshorn has been built at an elevation of 2300 metres, the stream of tourists begins to be directed to that quarter. The Val d'Anniviers is certainly one of the finest in Switzerland, and offers in its upper end a truly superb panorama. Zinal is situated at the foot of the great glacier of Durand, and in a beautiful situation. On one of the flanks of the Tounat, at an elevation of 2300 metres, is the fine hotel, erected last year by two members of the Italian Alpine Club—Messrs. Moroni. It is reached from Vissove or Zinal by a path which winds through a superb forest of Larch, *Pinus Cembra*, and *Rhododendrons*. *Pyrola uniflora*, *Vaccinium*, *Vitis Idea*, *Arbutus uva ursi*, many *Orchids* and *Gentians*, cover the soil of this forest. Arrived at the upper limits the hotel is reached, situated on a sunny terrace enamelled with flowers. Among them may be mentioned *Androsace carnea*, *A. obtusifolia*, *Gentiana brachyphylla*, *Clusii* and *purpurea*, *Azalea procumbens*, *Empetrum nigrum*, *Arctia montana*, *Senecio incanus*, *Lecantheum alpinum*, *Phyteuma hemisphaericum*, *Primula viscosa*, &c. These grow in the turf immediately round the hotel.

In the clefts of the rocks of Tounat may be found the *Edelweiss*, *Saxifraga oppositifolia*, *S. Rudolphiana*, *S. biflora*, *Lycopodium Selago*, *Artemisia spicata*, *Gentiana brachyphylla*, &c. At the Forletaz, one hour from the hotel, are *Androsace glacialis*, *Eritrichium nanum*, *Allosorus crispus*, *Draba pinnatifida*, *Arabis cerulea*, *Draba tomentosa*, *Geum reptans*, *Potentilla nivea*, *Lloydia serotina*, and large breadths of *Edelweiss* such as I have never seen elsewhere.

To those who wish to cultivate these alpine plants

I repeat that the best method is to collect seeds, or if transplantation be imperative, then the month of September should be chosen for the operation, because then the plants establish themselves much more readily than when in full vegetation. I need not remind the readers of the *Gardeners' Chronicle* that rare plants need protection, and that the smallest possible number of specimens should be taken in cases where the plants are rare. *Henry Corcoran, Director of the Alpine Garden of Acclimatization, Geneva.*

PINUS MONOPHYLLA

(*alias* FREMONTIANA).

THE NUT PINE OF NEVADA. Fig. 24.

I FIRST met with *P. monophylla*, when travelling with Dr. Gray in Nevada, growing on the rocky banks of a stream below Virginia City. I was struck with its resemblance in size and habit to *P. edulis*, which we had just left behind us in Colorado, and at the same time with the great difference in colour, *edulis* being of a dull leaden-grey with green, whereas *monophylla* was more glaucous with a silvery sheen. On attempting, however, to sketch it, I found I was only repeating the trials that I had made to do justice to its ally, and that without colour nothing was left whereby the two could be distinguished at a moderate distance. Professor Sargent, in his account of the forests of Central Nevada, says of *P. monophylla*, that "it is easily distinguished from all other North American Pines by its solitary glaucous terete leaves." This singular anomaly in the foliage is due to the cohesion of the two semiterete leaves of each sheath by their adjacent faces, and is far from being a constant character. In the plants at Kew the two leaves are as often free as connate; and on making a transverse section of any connate pair, it will be seen that the vascular bundle traversing the centre of the cylinder is, in fact double, and that the two parts are sometimes separate.

In the *Gardeners' Chronicle* (n.s., vol. xx., p. 44) is a figure (8), showing the young and adult foliage of *P. monophylla*, and which are alluded to on p. 48. The figure contains transverse sections of leaves as free and as connate, but the vascular bundles are not shown.

It has been doubtfully suggested by the late Dr. Engelmann, and more recently insisted upon by Professor Newberry, in the *Bulletin* of the New York Torrey Botanical Club (see *Gardeners' Chronicle* August 29, 1885, p. 271), that *P. monophylla* is a form of the Rocky Mountain *P. edulis*. This view is not supported by my own recollection of the two trees as they grew in their native countries; and as grown at Kew they appear to be entirely different. *P. monophylla* is as conspicuous as *edulis* is inconspicuous, and its leaves, besides being so different in colour, and so frequently connate, are much longer, stouter, firmer, and pungent at the tip; the sheaths are much larger, and not revolute in age as they are in *edulis*. No doubt the two are next of kin, and they inhabit adjacent areas in the same continent that run parallel with one another at 500 miles distance; so also they attain, each in its own area, nearly the same limits of both north and south latitude, namely, 32° N. to 39° N., which are all reasons for suspecting them to be geographically limited forms of one species.

Professor Newberry states that, "Where in districts where *edulis* and *monophylla* meet, it is very common to find trees in which the foliage is about equally divided between the single and double forms; hence, it would seem that the single-leaved variety is a somewhat dwarfed and depauperate form, the effect of aridity of climate, and the single solid leaf is apparently an exhibition of the tendency, so conspicuous amongst desert plants, to reduce the ratio of surface to mass in the leaves, or the parts of the plant which perform the functions of leaves." This reads very well, but it is not supported by facts. If either is a depauperate form, it is assuredly *P. edulis*. The so-called solitary leaf of specimens of *monophylla* from Nevada, Arizona, and of those grown at Kew, are exactly the measure of the two combined, in all that I have examined; and I find no tendency in larger suites of herbarium specimens of both species to deviate from the characters of leaves and sheath, colour, &c., that distinguish them. I am not aware whether their male and female flowers and cones have been critically compared.

P. monophylla forms a small tree 20 to 50 feet high, with a reddish scaly bark, short trunk, some-

times 6 feet in girth, and irregular ramification. It extends southward from Carson City to the mountains of East Arizona, growing in dry gravelly slopes and rocky elevations of 5000 to 6000 feet, and often, according to Professor Sargent, characterising, along with *Cercocarpus*, a region which presents the minimum of North American forest development.

P. monophylla is a very slow-growing tree; the wood is very fine grained, white, and soft to cut, and, though close in texture, brittle; Professor Sargent states that in this respect it resembles the *Juniperus californica* var. *utahensis* of the same region, and that a specimen he examined from the same locality as the *Juniper*, though only 5½ inches in diameter, showed 117 rings of growth; nevertheless, he suggests its introduction into the South of Europe "as a subject for forest planting, as it might flourish there on the dry hills and exposed hill-sides which has been found so difficult to recover with any evergreen tree." To make such plantations successful in Europe, this Pine must grow a great deal faster than it does in Nevada; the attainment of a height of only 30 feet, and a diameter of trunk of half a foot in a century, is not an encouraging prospect for the forester. It is, however, worth the trial; rate of growth is determined by favourable conditions of soil and climate, and if in these respects the dry hills of the Mediterranean are not all that could be wished, they are incomparably better than those of Nevada; still, it must be borne in mind that, favourable as the climate of Kew must be in respect of soil and moisture, as compared with either Nevada or the South of France, the *P. monophylla* has made very slow growth at Kew, not attaining 6 feet in height in twenty years. It grows faster, however, than *P. edulis*, and appears to be on every account better worth cultivation than that tree.

The only two qualities that recommend *P. monophylla* to the dweller in the district it inhabits are those attributed to its ally, namely, the abundance of edible seeds afforded by its cones, and the value of its timber as firewood. The latter quality threatens its extinction, for it is in great demand as fuel for the engines at the mines, and is hence, as I was informed, rapidly becoming a scarce tree. *J. D. Hooker.*

REMARKS ON THE FRUIT CROPS, 1886.

[For Tabulated Summary, see p. 107.]

SCOTLAND.

ABERDEEN.—Apples had very little blossom, on some trees none; what there was did not set. In this district it may be said to be a complete failure. Pears never do well, but this season is the worst I have seen during fifteen years. Plums are a large crop on Victorias, Jeffersons, and Coe's Golden Drop; other sorts are under average. Cherries are also a poor crop. Small fruits have suffered from high winds, but though under average are of good quality. Early Strawberries are a large crop; late sorts not quite so good. *J. Forrest, Haddo House.*

EARLY.—Apricots, Peaches, and Plums are our best fruit-tree crops. The latter, though having a light crop last year, have generally a good crop, both on walls and standards, Damsons (Shropshire) being the lightest. The heavy crop last year of Apples, together with the influence of a cold, wet, ungenial autumn, prevented wood and buds becoming properly developed. The display of blossoms this spring showed so weak and imperfect that it failed to set. Pears, especially upon walls, are somewhat better. Cherries are a light crop and poor. Bush fruit, with the exception of Gooseberries, is good. *John Webster, Gordon Castle.*

EAST LOTHIAN.—We never had a better appearance for fruit than we had this year, but the cold, damp, sunless weather and frosty nights when the trees were in bloom has told heavily against standard Pears and Apples. Lord Sufield, Worcester Pearmain, and a few of the more hardy varieties of Apples have a good crop. Pears on walls are pretty fair. Plums are very thin, except Victorias. Morello Cherries are excellent. Apricots will be poor. *L. Dow, Newbythe, Prestonkirk.*

FORK.—There is a fair crop of all outdoor fruits this year. Last summer was dry, and the wood was better ripened than it has been for years. Although the temperature only twelve times exceeded 70°, the highest on July 25 was 77°; the rest of the twelve times was only from 71° to 75°. The winter was

long and cold, which kept vegetation at rest till far on in the spring, and since then it has been dry and cold, with more than ordinary brilliant sunshine. Clear and bright both night and day on July 2 the temperature stood at 80° for four hours. I do not recollect of it standing so long at that figure during all the thirty-three years I have been here. Nevertheless all kinds of fruit are rather late. We only got the first dish of Strawberries yesterday. *J. Mitchell, Panmure, Carnoustie.*

— The crop of Apricots, except under glass, is under rather this season. Plums an average, especially the Victoria, which seems able to withstand the spring frosts better than other kinds. Cherries about an average, but only cultivated in gardens. Peaches and Nectarines are rather under, and are only cultivated on walls and under glass. Apples are miserably poor; only once before have we seen so poor a crop.

most of the free-bearing sorts, such as Warner's King, Ecklinville, Duchess of Oldenburg, Lord Suffield, Stirling Castle, Hawthornden, King of the Pippins, Worcester Pearmain, Golden Spire, Lane's Prince Albert, Loddington, Court of Wick, and Keswick Codlin, are bearing excellent crops. Pears are a better crop on standards than on the walls, *Beurré d'Amanlis*, *Hacon's Incomparable*, *Louise Bonne* of Jersey, *Napoleon*, *Catillac*, and *Hessle*, all bearing fine crops on standards. On walls *Beurré d'Aremberg*, *Doyenné du Comice*, *Comte de Lamy*, *Easter Beurré*, *Marie Louise*, *Beurré Diel*, *Williams' Bon Chrétien*, *Hacon's Incomparable*, *Beurré Bosc*, and *Jargonelle*, are bearing best. Plums are generally a fine crop, but they have suffered a good deal from insect attacks. Cherries are a good crop, but have also suffered from insects. Apricots, Peaches, and Nectarines suffered much from the cold wet weather

Raspberries are also heavily cropped. Currants, Gooseberries, and Strawberries are all good. Peaches and Apricots have heavy crops, and look well. *Sea Eagle* Peach is a grand outdoor Peach, being strong and healthy. *D. Inglis, Howick Hall.*

DURHAM. — Fruit generally, though not abundant, is quite equal to what may have been expected, considering the unripened state of last year's growth, and the long continuance of severe weather both winter and spring. I do not remember a later spring. Apricots were three weeks behind the usual time of blooming, and no doubt the one principal cause of the buds' slow development was the result of the land being so long saturated with snow-water, which produced slow and sturdy growth; and had it not been for the unusually late and severe spring frosts there would have been a 'good crop, judging from the amount of bloom. *R. Westcott, Raly Castle, Darlington.*

— Apples and Pears are very poor crop in our county. The late frost cut up the blossom, that all fell off. Only late flowers set their fruit, this being very noticeable in the *Jargonelle* Pear, consequently they are small, owing to being so late. Strawberries are finer than we have had them for some time. Gooseberries are a heavy crop, and other small fruits are a good average. Raspberries terribly cut by late frosts. *J. Hunter, Lambton Castle.*

LANCASHIRE. — There was once every prospect of a good all-round fruit crop, but the cold and violent wind that blew chiefly from the west, as late as the middle of June, shrivelled both fruit and foliage. Even the leaves of forest trees on the wind side were brown and looked starved, and the ground was more than once covered with lattered leaves. As I write the wind is blowing cold and with such force that such crops as *Brussels Sprouts* in the garden, which falls westward, are nearly twisted out of the ground. Pears on west walls are all gone. *W. P. Roberts, Cnerdon Hall, Preston.*

— All fruit trees upon walls are very disappointing this year. There was a good show of bloom: Pears and Apples a failure, and Plums only a partial crop. Although we had no frost at the time the trees were in bloom, we had very cold and wet, dull weather, bringing out the blooms in a weak unhealthy state, and so spoiling the set of fruit. The trees likewise were late in showing active growth. Taking crops in general this is the latest and worst season we have had for years. Early Strawberries are a good crop, but one night's frost, whilst the later varieties were in bloom, spoilt the crop of these. *H. Lindsay, Huntwood Park, Burnley.*

MIDLAND COUNTIES.

CHESHIRE. — In this district there was a good show of bloom on fruit trees of nearly all descriptions, and the absence of frost when the Plums were in flower caused large crops of fruit of these to set. Damsons also, which are largely grown in this county, are more abundant than for many years previously. The cold weather, with frost and snow, destroyed a great part of the flowers and embryo fruit of Apples and Pears, so that the crops of these are generally thin; small fruit, plentiful; Strawberries, a moderate crop. *W. Whittaker, Crewe Hall, Crewe.*

SHROPSHIRE. — Apples and Pears gave great promise of an abundant crop, but on May 27 we had a tremendous hailstorm, which literally cut things to pieces, and anything that was in flower at the time was destroyed. Lord Suffield, Stirling Castle, Cellini, and Small's Admirable are bearing heavy crops, while others are a blank, so that on the whole Apples are decidedly under average. With the exception of *Beurré Diel*, *Beurré d'Amanlis*, Pears are in the same condition; while Damsons and Plums are overloaded with fruit. Bush fruits are plentiful, while Strawberries are in great want of rain. *J. Louder, The Quinta, Chirk.*

— The fruit crops in this district are under the average. Pears are very thin indeed, and especially on wall trees. *Louise Bonne* of Jersey, *Brockworth Park*, *General Todtleben*, *Winter Nelis*, *Beurré Rance*, and *Huyshe's Prince of Wales* are the only varieties which are carrying an average crop, whereas most of the other leading varieties are almost nil. Apples are also very light, and also Apricots. Plums are over the average, and trees are very free from blight. Peaches and Nectarines are also bearing

FIG. 24.—PINUS MONOPHYLLA. (SEE P. 136.)
(Sketched in Nevada by Sir Joseph Hooker.)

Pears are a little better, but by no means an average. Small fruits, such as Gooseberries and Currants, in many places are fairly good where any attention to culture has been given. Strawberries we reckon to be an average. Nuts are not cultivated in the Carse. *Carse of Gairrie.*

KINROSS. — This is a poor season for fruit, indeed we have not had the like of it for a great many years. Cherries did not set, and are only about the fourth of a crop. Apples are very scarce and very small; Pears the same. Gooseberries two-thirds of a crop, but of a fine size. Currants of sorts rather poor, Raspberries are an average crop. Strawberries, some sorts good, others a poor crop. *J. Fortune, Blair Adam.*

MIDLOTHIAN. — The cold, wet spring retarded the flowering of fruit trees for nearly a month later than the usual period, and the blossom escaped injury from late frost; still the "set" of fruit was not over-abundant, and was considerably thinned by the cold raw weather in the end of May. The crop, on the whole, is a late average. Apples are a fair crop, and

in May, and the crops are light, but the fruit clean and fine. Strawberries are a good crop, but very late. Gooseberries, Currants, and Raspberries are abundant and fine. Generally, fruit is large, fine, and clean; and it favoured with fine weather to bring it to maturity the crop will turn out well. Vegetable crops are also very late, but of excellent quality, and promise abundance for the rest of the season. *M. Dunn, Dalkeith.*

ENGLAND.—NORTHERN COUNTIES.

WESTMORELAND. — Owing to the cold autumn last year wood did not get ripened, consequently we did not have much show of blossom, and the blossom that did show was destroyed by the fierce winds we had in May. This last spring has been the coldest and most sunless we have ever experienced. *W. Miller, Underley, Kirkby Lonsdale.*

NORTHUMBERLAND. — Apples, Pears, and Plums are very much under what we had last year, which is certainly due to the wet and sunless autumn we had. Fig trees of *Brown Turkey* are very heavily cropped.

heavy crops of fruit. Strawberries are a good crop, but smaller than usual through the want of rain. All small fruits are good. Nuts quite a failure. *R. Milner, Sandome Castle, Shrewsbury.*

STAFFORDSHIRE.—With a few exceptions the fruit crops in this district are good. Owing to the severe weather in March, which retarded their blossoming, we have a fair crop. Pears and Apples being abundant last year around this district, we could not expect a heavy crop. Small fruits are very good. Peaches and Nectarines set well, and look promising. Damsons are abundant—the best crop for many years. Apricots are very small, and much under average. *G. Wythes, Tellesey Park.*

LEICESTERSHIRE.—Taken as a whole the fruit crop round here may be considered a good one. Apples were very full of blossom, but it was very wet and cold at the time of blooming, so that only a small portion set, and a great many trees, especially of the Codlin sort, are infested with a kind of red rust. Peaches and Nectarines are looking well and a good crop, but late Plums are a very heavy crop. Currants and Raspberries are a good crop. Strawberries are good, rather smaller than usual, and about three weeks later. *G. C. Maynard, Coleorton Hall, Ashby-de-la-Zouch.*

WARWICKSHIRE.—Fruit crops are generally good this year, more especially Cherries and Plums, as compared to last year. Pears and Apples are an average, and in some districts in this neighbourhood they are above an average; but there are to be found orchards which are comparatively bare, another proof that there is no rule without an exception. Peaches and Nectarines are not much grown here out-of-doors, indoors they are very fine. Small fruits are everywhere plentiful, clear of aphid, and of excellent quality. Strawberries are very fine, and where they were liberally mulched before the commencement of the late drought they suffered little, and in these cases the fruit was large and fine. *W. Miller, Coombe Abbey.*

BEDFORDSHIRE.—The Apple crop, which once looked so promising, will, in this district, be below average. The trees, although free from aphid, are blighted and unhealthy. Cherries are a fair average. Apricots very scarce, no bloom from the first. Plums: Victorias and Damsons a heavy crop in some places. Pears average, but in want of warmer nights to swell them off. Strawberries the worst failure for years. Currants and Gooseberries plentiful and clean. Raspberries giving up for want of rain. *A. Mackay, Woburn Abbey.*

BUCKS.—Peaches and Nectarines very good this season; trees look well and have not been troubled with greenfly. The same applies to Plums, which are a very good crop. Morello Cherries are very fine, and scarcely any black aphid. Pears very thin, and Apples scarcely any in this locality. Strawberries promised well, but the exceptionally dry weather has injured the crop very much. Figs (out-of-doors) are a good crop. Gooseberries, Currants, and Raspberries are abundant. *T. Baillie, Sharpleas, Amersham.*

— Apples, although very late in flowering, are almost a failure, I think owing to so much dull wet days when in flower, combined with a low temperature, prevented the bloom setting. Plums are a very heavy crop, the trees are breaking down, we are tying up the branches with tarred string. Cherries are also a good crop. Small fruits of all kinds are abundant and good. *J. Smith, Mentmore.*

— Apples here, and in this district, are very scarce. Plums are here under average, but in other places in the locality they have a full crop both on wall trees and standards. Of Pears we have none, and they are rather under average in the neighbourhood. Filberts are not half a crop, and very much blighted. Walnuts are a total failure. Bush fruit is very abundant; but Strawberries, that flowered abundantly in some places, are about an average crop. Morello Cherries have cropped fairly well, and sweet varieties are abundantly cropped. *W. Waters, Bulstrode Park, Gerrards Cross.*

HERTFORDSHIRE.—The frosts on April 30 and May 1 reduced the fruit crops generally very much. We have an average crop of Pears, but the fruit does not promise to be so good as usual, which I attribute to the heavy crop of last year, and the fruit is much damaged by caterpillars. Strawberry plants were much weakened by the dry weather last summer, and the first blooms were spoiled by the frosts on the above dates. *G. Norman, Hatfield.*

— Apples very short crop, except on trees sheltered from cold winds, on which there is a fair

crop. Trees of all kinds suffered from the caterpillar. Lord Suffield, Lane's Prince Albert, Worcester Pearmain, and Lord Grosvenor Apples are amongst the best crops. Pears are a fair crop, trees and fruit very clean and healthy. All small fruits are a very abundant crop. Gooseberry trees almost denuded of foliage by caterpillars, and it is impossible to keep them under by syringing, hand-picking, and the various other methods tried. Strawberries, since the rain on July 11, 12, and 13, improved very much. James Veitch has stood the drought better than any other variety. The crop on the whole is less than it has been for the past ten years. *C. Manfell, Moor Park.*

EASTERN COUNTIES.

LINCOLNSHIRE.—The lateness of the season encouraged the hope of an Apple crop, but the prolonged occurrence, even in June, of cold, ungenial weather, checked the growth, chilled the blossom, and resulted in an almost total failure in this fruit. Pears suffered in the same way, and the crop is thin and partial. Apricots scarcely recovered from the exhaustion of a heavy crop last year, and the bloom was scanty. Peaches are bearing well. Cherries suffered from the blighting influence of a cold spring-time, but are recovering. The crop of Gooseberries is very great; Currants equally good. Raspberries, checked at the moment of producing bloom, have not recovered, and the canes are yellow and unhealthy. Drought has diminished the Strawberry crop. *W. Ingram, Belvoir Castle, Grantham.*

— The worst crop of Apples and Pears that has been in the whole neighbourhood for twenty-one years. Gooseberries, Currants and Raspberries—the last named will be much benefited by some good showers. *G. B. Tillyard, Brocklesby Park.*

NORFOLK.—The crops of fruit of all kinds are very light, and mildew seems very prevalent owing to the cold nights succeeding hot dry days. The wind has been N. and N.E. most of the summer, and a very small rainfall, which is also detrimental to everything. *T. Wynne, Wratton Hall.*

SUFFOLK.—Apples are a poor crop in this locality. Orchard trees almost a failure, but nice crops on espaliers. Plums in abundance. Peaches and Nectarines again carrying average crops, though foliage terribly cut up with long cold spring, but now healthy and growing. Pears will be an average. Gooseberries in abundance. Currants and Raspberries very good. Strawberries good crop but late. Filberts and Walnuts under average. The recent rain was most acceptable, and will crown us with a good fruit season. *G. W. Eden, Henlow, Lovestoft.*

— The fruit crop, taken altogether, in this neighbourhood is not considered to be up to the average. We suffered somewhat from spring frosts and strong winds just as the Apples and Pears were in full flower, and great damage was done. Both Apples and Pears will be under average, but all kinds of stone fruit is most abundant. Strawberries, too, are poor on light soils, but that is chiefly owing to our having had two very arid seasons in succession. I never remember seeing the Cherries, Plums, Peaches, and Nectarines so free from aphid. *J. Mill, Kettleham Hall, Woodbridge.*

— Apples and Pears generally thin; good show of Apple blossom, which were starved by a long continuance of cold weather rather than by any exceptionally severe frosts. Peaches, Nectarines, and Apricots exceptionally plentiful, as well as Cherries. Plums variable—abundant on standards, and scarce on walls. Bush fruits, especially Raspberries, very fine; Gooseberries and Currants generally plentiful—black less so than white and red Currants. *D. T. Fish, Harwich.*

ESSEX.—Apples are likely to be very limited in quantity. Orleans, Victoria, Prince of Wales, and Day's Seedling Plums are already breaking the trees down with the weight of fruit. Morello Cherries are abundant, and recent rains are ripening them well. *William Earley, Ilford.*

SOUTHERN COUNTIES.

BERKSHIRE.—Apricots not a good crop, branches dying off more than usual. Plums plentiful on wall trees, particularly cordons; on standards irregular. Peaches and Nectarines much subject to blight. Apples promised well, but are generally a very light crop, especially orchard trees. Pears on walls, notably on cordons, look well, and carry good crops;

standards and pyramids in cold and exposed places have irregular crops. Small fruits of all kinds are very abundant, and of good quality. Strawberries suffered very much from dry weather. Walnuts very few. *G. Stanton, Park Place, Henley.*

MIDDLESEX.—Apricots are very thin indeed. Peaches and Nectarines fairly good. Apples have not at all come up to the promise of the bloom, but there will be relatively about half a crop, and probably a fine sample. Pears are fairly abundant, though now much thinner than originally promised. Cherries of sweet kinds, especially May Dukes and Bigareaus, very good crops, and Morellos abundant. Plums are plentiful, especially Damsons; and of small fruits, red and black Currants, Gooseberries, and Raspberries are heavy crops. Strawberries promised well, but suffered from the exceeding heat later. *A. Dean, Belfont.*

SURREY.—In this district trees of all kinds were well set with bloom, the continued frost and general low temperature affected the Apples, Pears, and Plums, after setting their fruit. The best crops of Apples and Plums are to be found on south-east aspects in the orchards. The wall trees are heavily cropped. Bush fruits are excellent. Strawberries suffered from the intense heat, although well watered and mulched. Trees on the whole are very free from blight and insects. *A. Evans, Lytch Hill, Haslemere.*

KENT.—Three excessively dry years in succession told on the fruit crops, many trees dropped both their fruit and leaves, so that it is feared that all top fruit will be very small this season. Although the weather was as unkind, all through the spring ad early summer, as could be remembered, yet everything looked promising; and those who had gone largely into fruit and vegetable growng in this part were sanguine that they would recoup themselves most of their outlay, are now sorely disappointed. *H. Cannell, Swanley.*

— The Cherry crop is especially good in this district. Apples and Pears are generally thin in the orchards, with the exception of some few trees which are bearing good crops. Gooseberries are an exceedingly heavy crop, and the berries large and good. Black and red Currants in large plantations are, generally speaking, good. Plums are plentiful and good. The Kent Damsons are unusually abundant. Kent Cob-nuts are very thin. Strawberries and Raspberries have suffered very much from drought. Peaches and Nectarines a thin crop; much blistering of leaves, but trees are now looking healthy and well. *C. Haycock, Barham Court, Maidstone.*

SUSSEX.—In this district Apples are under the average in the orchards; in the gardens, on bushes and pyramid trees, we have a fair crop—such as Keswick Codlin, Lady Henniker, Warner's King, Flower of Kent, Tower of Glamis, Melon Apple, Adam's Pearmain, Cox's Orange; of Pears, a good average crop, on such as Marie Louise, Beurré Cluigeau, Chaumontel, Broom Park, Uvedale's St. Germain. Plums are an average—Victorias and Pond's Seedling, Kirk's Golden Drop. Strawberries have been abundant; all small fruits in great abundance. Nuts are very good. Cherries—Morellos, very good; Cherries in this district are of all kinds over the average. *Sydney Ford, Leonardlee.*

WILTSHIRE.—The Apple and Pear crops are not quite so good as they promised to be eight or ten weeks since, the blossoms having been severely thinned by the frosts which they were subjected to early in May, and the easterly winds and low temperature which prevailed during the last three weeks of that month checked growth in the trees to such an extent as to cause a large percentage of the embryo fruit and the blossoms which had only been slightly touched by the frosts to drop. Plums are a very good crop, also Cherries; although trees of the Morello, which were very heavily cropped, have dropped a goodly number of fruit during the last two weeks, notwithstanding the fact of their having been heavily mulched and watered at the roots. Sea Eagle and Alexandra Noblesse Peaches, and Elrage and Pine-apple Nectarines, are the best cropped varieties of these fruits. Small fruits are abundant and good. *H. W. Ward, Longford Castle.*

SOMERSETSHIRE.—Apples blossomed very abundantly, but set badly. Lord Suffield, Tower of Glamis, Duchess of Oldenburg, Adam's Pearmain, Cox's Orange Pippin, and King of the Pippins, are most abundant. Pears on all kinds of trees, and in nearly all positions very abundant, and promise to be of good size. Many Plums dropped, but there are still heavy

crops. Apricots did not blossom strongly, and I suppose the cold frosty winds are to blame for this. Strawberries bloomed strongly and abundantly, but the long spell of dry weather spoilt the crops. Nuts were crippled by frosty winds. *W. Iggulden, Weston Gardens, Frome.*

DEVONSHIRE.—Apricots, Peaches, and Nectarines are generally good; the opening of the blossom was much retarded in the spring, so that when they did expand the weather was more propitious than usual. The Apple bloom was very abundant, but did not set well, consequently not half a crop is found in many gardens and orchards. Pears, both on walls and bush trees, set good crops. Plums are very abundant in many places. Early Cherries have done well, but Morellos failed at the stoning period. Medlars, a good crop. Figs a fair crop on bushes. Small fruits are a good average, but on our light soil everything is suffering much from the lengthened drought, and any of the above fruits named are only saved by mulching and watering. Strawberries though doubly mulched with short and long litter, are poor, though the early crop was all that could be desired. *D. C. Powell, Postern-ham Castle.*

—Almost all kinds of fruits are this year very abundant, Peaches and Nectarines especially so. Nearly every flower must have set its fruit, and in all the gardens I have visited the same prevails. Plums and Pears are a large crop, and also all small fruits. Apples are a light crop generally, though many sorts are bearing freely in gardens. A noteworthy feature has been the almost entire absence of insect pests; scarcely any aphid having been seen on Cherries, Plums, &c., or Rose trees. The reason of this doubtless is the temperature having been uniform in a marked degree. No sudden changes influenced growth or retarded it, and the result is a healthiness and vigour beyond what is generally seen. *J. Enstone, West, near Exeter.*

CORNWALL.—The fruit crops in this district must be considered to be under an average, as Apples and Pears are scarce. There was not a good show for the former, and owing to cold dull weather at the critical period great quantities fell off; but with Plums and Cherries the reverse is the case, for at the time of their setting the weather was fine, and what frost we had was not severe, and had there been plenty of bloom there would have been abundance of fruit. Plums have not set so well for several years. This I find is the case in most places. Figs are plentiful. *C. Leigh, Bocomoc Park.*

WESTERN COUNTIES.

HEREFORDSHIRE.—Apples are a very thin crop, owing partly to the heavy crops borne during the two last seasons, and the heavy rains that fell during the period of blooming. This season in the month of May, 7½ inches of rain fell here. Plums and Damsons are plentiful, and the trees fairly clean from aphides. Small fruits are good. Amongst Raspberries, Baumforth's Seedling is one of the earliest and best. Strawberries have suffered during the late dry weather on poor land, but are very good on well manured land; *Losford Hall* with us is one of the best grown. *W. Nash, Brynwynn.*

—Severely punished by the drought last year, many fruit trees could not form the flower-buds properly; others broke into latent growth and did not ripen their wood well. A useless—I may say a frostless spring followed a cold depressing winter, with the natural result—one of the most partial fruit years we have experienced for a long time. Apples and Pears blossomed well, but exposed to terrific storms of rain at the time, and, the subsoil being cold and saturated, some failed to set, others have dropped a large percentage of their fruit, and not a few trees would be greatly benefited by thinning. Many of our orchards bore immense crops last year, and where not well manured and managed they are now thin. On the whole the crop will, no doubt, prove heavier than many people anticipate, and what we lose in quantity may be gained in quality. It is gratifying to find the better varieties of Apples, including Ribston, Cox's and Blenheim Orange bearing freely. Stone fruits of all kinds, with the exception of Apricots, set abundantly; the latter with me cast their flower-buds in their infancy, but the few that escaped set to a flower, and are swelling well. Cherries have thinned themselves, still the crop is heavy, but the fruit lacks size, juice, and sweetness. Peaches and

Nectarines—a magnificent crop—required much thinning. The fruit is still backward, but very promising, and the trees are still free from insects. Bush fruit of all kinds is abundant, and the trees are clean; indeed, the general freedom from insects, after the remarkable aphid year of 1885, is a phenomenon both surprising and unaccountable. Raspberries suffered through the hot, dry weather, but the showers of the past few days have set them up; and late Strawberries, notably Oxonian, are heavily cropped, and doing well. *W. Coleman, Eastnor Castle.*

WORCESTERSHIRE.—Crops on the whole very good, with trees healthy and clean. Apples flowered freely, but trees have dropped very many fruits. Pears excellent, both in quantity and quality. Wall and open-ground Apricots very thin. Plums an enormous crop of nearly all kinds—Cherries also; fruit very small, and but little flesh. Peaches and Nectarines have excellent crops, and trees healthy. Much less fly than is usual. Strawberries have proved the most unsatisfactory crop, although at one time they looked very promising. The drenching rain, and the nearly frosty nights of May, and the tropical drought of June, will account for such poor results. Oxonian, usually our best late, quite failed to put up any flower. Raspberries and other bush fruits abundant and good. *W. Crump, Malvernfield Court.*

—Apples and Pears are, upon the whole, fair average crops; there was an abundance of bloom, which set and promised well, but the cold weather and continued heavy rainfall throughout June caused the young fruit to drop considerably, and in some instances to clear the trees completely; they are now clean and healthy, and the fruit promises to be of good quality. Apricots are thin everywhere in this locality, except under glass coverings; the bloom in spring was remarkably small and weak, and consequently set badly. On the other hand, Plums, Damsons, and Cherries are most abundant, the fine warmer weather we are experiencing coming just in time to save the latter. Peaches and Nectarines are fairly good, and the trees healthy and free from blight, and making rapid growth. Strawberries are, on the whole, an average crop, but not up to the mark in size and quality, and will soon be over. Gooseberries, Raspberries, and Currants are most abundant and fine. *John Austen, Willey Court.*

WALES.

GLAMORGANSHIRE.—Apples are a fair crop in sheltered situations, where they ensured an early set, but thin in exposed positions. Apricots, Plums and Cherries do not do well here in the best of seasons, therefore are very little planted. Peaches and Nectarines we have a remarkably good crop of—have had to thin out several times. Pears are promising, good; and bush fruits are generally good and plentiful; the same remark applies to Strawberries. *G. Harris, Singleton, Swansea.*

IRELAND.

KILKENNY.—In this district large fruits in general are under an average crop. Amongst Apples, Stirling Castle, Ecklinville Pippin, Scarlet Pearmain, and Dumelow's Seedling are bearing good crops; other sorts scarce. Of Pears, Jargonelle, Louise Bonne of Jersey, and Williams' Bon Chretien are good crops. Victorias, amongst Plums, are good, other sorts scarce. Small fruits in general are abundant and of good quality. *W. Gray, Woolstock Park, Innishnee.*

CHANNEL ISLANDS.

JERSEY.—The crop of stone fruits will be below the average, owing to the cold nights during the month of May, much of it having fallen off the trees after it appeared set and in a fair way of doing well. Apricots, Peaches, and Nectarines did not set freely, but Cherries and Plums have suffered most. Pears and Apples will be a medium crop, but where the trees were in exposed situations they are bare of fruit. Strawberries have been fine, but the season has been short, owing to the dry weather. Small fruits are abundant, but small, owing to the same cause. Grapes promise to be an abundant crop; the erection of glass-houses in the islands for the growth of Grapes and Tomatos is gradually extending. High culture is becoming the rule of the times. *C. E. Saunders, St. Saviour's.*

MANURES.

REVERTING to the subject treated of at p. 624, vol. xxv., and assuming that the constituents, nitrogen, phosphoric acid, potash, and lime, are the most important ingredients in a manure, and are those in which our soils are the most likely to become deficient, we see from the tables previously given (p. 624, vol. xxv.), how the stores of them within the soil would be affected by the removal of one ton of each of the crops enumerated.

We now give the amount of these several constituents extracted from the soil by the growth and removal of one ton of each of the following kinds of fruits, in the fresh state as gathered for use.

Amount of Selected Constituents in a ton of various kinds of Fruits.

Description of Fruit.	Nitrogen.		Phosphoric acid.		Potash.		Lime.	
	Lb.	32.0.	Lb.	11.0.	Lb.	10.3.	Lb.	15.0.
Strawberries...	2.2	0.0	1.4	5.4	0.5	0.5	0.5	0.5
Figs...	2.2	0.0	1.4	5.4	0.5	0.5	0.5	0.5
Green Gage Plums...	2.2	0.0	1.4	5.4	0.5	0.5	0.5	0.5
Apples...	1.3	1.1	1.1	3.1	0.5	0.5	0.5	0.5

Gooseberries...	1.3	1.4	3.4	1.1	1.1	1.1	1.1	1.1

These facts teach us that it is not enough that the land we cultivate is in a good condition to begin it; if it is to continue productive and yield a fair return for the labour expended upon it the fertility must be maintained by a gradual development of the immense store residues which lie in a dormant condition within the soil, as-isted from some external source in the form of manure.

The poorer the soil in what may be termed its natural fertility, the more complete must be the restoration of the ingredients carried away in the crops, if productiveness is to be maintained or increased. When land is in good heart, a much smaller proportion of manure will keep it so, but even the best of our soils can be made to yield larger crops by the aid of manure than they will without it.

If we proportion our supply of manure to the waste caused by the growth and removal of vegetation, we shall keep up the fertility of the soil to the degree in which we found it; if we give more judiciously, we gradually increase the fertility; but we may give too much at a time, and thus, instead of assisting vegetation, we may impede it by over-nourishment, and much of our manure will be lost by dissipation in the atmosphere, or be carried off in solution by the waters which pass through the soil. These principles should be kept in view in the practical application of manures, and if experience confirms their truth we shall have obtained a clearer insight into the mode in which different kinds of manures assist vegetation, and increase fertility in the soil we cultivate.

On soils of open texture and small retentive power preference should undoubtedly be given to manures of little solubility, in order to diminish, as much as possible, the loss occasioned by heavy rain; bulky organic manures, as stable dung or sea weed, are in such cases the most suitable.

Judiciously used special manures, such as guano, superphosphate of lime, nitrate of soda, ammonium salts, potash, &c., are the agents which bring into useful activity the dormant resources of the soil; they restore the proper balance between the different constituents, and supply the excessive demand for some particular element. And, in addition to the particular food-supply contributed by them they are, as a rule, more active, and give quicker returns than farmyard manure.

But to the ordinary gardener farmyard or stable dung is the sheet-anchor, mainly because it is easily applied, and most of the more important ingredients of plant food are thus provided, although these may not always be in the best proportions. To prevent a deficiency arising in the soil of any one element, farmyard manure has to be employed in much larger quantities than special manures, and by this means furnishes an excess of certain constituents of what is actually required by the growing crop. These inert matters of farmyard dung may influence the fertility of the soil by amending its texture or otherwise modi-

fyng its physical character. Most gardeners are aware of the vastly important practice of mulching with partially decomposed stable dung, and especially is this to be recommended to fruit-trees, shrubs, Roses, Raspberries, Strawberries, &c. The benefit to be derived from the practice in the cultivation of Peas we have observed more than once. To have a vigorous and uninterrupted growth, it is necessary to have moisture in the soil in immediate proximity to the mass of root-fibrils which branch out from the stock of the plant. Therefore, in periods of hot scorching sunshine, and with sandy or light soils, it becomes essential to retain the water from rain to rain.

Liebig teaches this doctrine, for he says:—"Though the soil be ever so much richer in the elements of food for plants, still the latter will not grow in hot weather if there be a deficiency of moisture in the soil; for the moisture in the soil is the channel through which mineral food has to reach the interior of plants." Further, farmyard manure in its office of mulching yields a direct supply of carbonic acid, which may act on the mineral constituents of the soil, and liberate their fertilising properties.

In a ton of well-made farmyard manure there is contained about 12 lb. of nitrogen, 11 lb. of potash, 8 lb. of phosphoric acid, and 16 lb. of lime. The composition is of course variable, according to the animal producing it, the food of the animal, and the kind and quality of the litter used.

The after-treatment of the manure is also most important. A large proportion of the nitrogen is voided by the animal in the form of urine, and generally the richer the diet the higher will this proportion be. If, therefore, the manure is frequently washed by rain, and the washings are allowed to drain away, serious loss will occur. Hence the superiority of box manure to that made in an open yard.

As the whole object of manuring is to supplement the deficiencies of the soil, it is highly desirable that the gardener should ascertain by trial, both in the greenhouse and in the open garden, what is the actual amount of increase and effect which he obtains from the application of the manure he uses. A few carefully made experiments will teach him what his land and crops are really in need of.

The following table, compiled from the numerous and invaluable experiments of Sir J. B. Lawes, at Rothamsted, will give some indication of what may be expected:—

Table showing the Produce per Acre obtained with Potatoes, Swedish Turnip Roots, and Mangel Wurzel Roots, over a series of years, by the application of different Manures on the same land, year after year, at Rothamsted.—

Manures per acre every year.	Potatoes, average of five years.		Swedish Turnips, average of fifteen years.		Mangel, average of five years.	
	Tons.	Cwt.	Tons.	Cwt.	Tons.	Cwt.
Without manures	2	0 1/2	0	11	4	6
Farmyard manure, 14 tons	4	13 1/2	6	4	14	12
Superphosphate of Lime, 3 1/2 cwt	3	11 1/2	2	12	5	1
Farmyard manure and superphosphate	5	16 1/2	6	7	15	1
Ammoniacal salts, 400 lb.	2	10 1/2	0	13	8	3
Nitrate of soda, 550 lb.	3	4	0	13	15	16
Mixed mineral manures and nitrate of soda (complete fertilizer)	7	6 1/2	5	2	17	2

Some of the lessons to be learnt from these experiments, are that whatever stores of food the soil may have naturally, it fails to furnish enough material in an available form for the production of large crops. A general manure such as farmyard dung may be used year after year in a perfectly routine manner, but when a special manure is employed, the importance of watching its effects and altering it as circumstances indicate, cannot be overestimated. This forces upon us, further, the necessity for studying the succession of manures as well as that of crops. In many cases in which ammonia salts or nitrate of soda when first used will prove beneficial, after a time loses its effect, and the reason, no doubt, is that by its means the phosphates existing in the soil becomes reduced in amount, so that change of manuring is rendered necessary. *John F. Wills, Harpenden.*

* See also mineral manure containing a supply of potash, and containing potash and sulphuric acid.

FUNGUS ON POPPIES.

PERONOSPORA ARBORESCENS.

THE accompanying illustration (fig. 25) shows the effect of *Peronospora arborescens* on *Papaver dubium*. The engraving was taken from one of a large number of examples found in a bed of *Papaver dubium* growing on a chalky bank on Dunstable Downs. The fungus, which in this instance attacked a wild Poppy, is of considerable importance to gardeners, as it frequently grows on garden Poppies; it also destroys the cultivated opium Poppy in Asia and Europe. In the instance here described the *Peronospora* chiefly attacked the peduncles of the flowers and fruit; its effect was to destroy and in some instances to quite strip off the epidermis. This skinning process had the effect of making the peduncles curl and writhe with all sorts of strange contortions: one of the contorted peduncles is here shown. Some of the peduncles were only slightly curled, others very much so, whilst some were twisted in the style of long corkscrews 16 inches long. The peduncle illustrated may appear to be an unusually long one, but amongst the attacked examples it really was a short one, as the length just mentioned shows. The peduncles seem as if they grew to

FIG. 25.—EFFECT OF PERONOSPORA ARBORESCENS ON PAPAVER DUBIUM.

abnormal length in an apparent attempt to rid themselves of the unwelcome parasite. In the attacked peduncles all the flowers and seed vessels pointed downwards. Dr. Trail of Aberdeen has found the resting-spores of *Peronospora arborescens*. Instances similar to the one here illustrated are not uncommon; for instance, Charlock is frequently attacked by a fungus named *Cystopus caudatus*; the fungus not only twists the stems in an extraordinary manner, but inflates them (as well as the leaves and flowers) to abnormal proportions. Nettles are often attacked by the orange coloured fungus named *Ecidium urticæ*. This attacks the stem, and by its injury to the epidermis causes the stem to bend sharply downwards towards the ground, the fungus itself on the top of the elbow looks like a large yellow caterpillar in the act of feeding on the stem. The two examples shown by me at the Scientific Committee (see *Gardeners' Chronicle*, p. 824, vol. xxv.), are now in the British Museum collection. *W. G. Smith, Dunstable.*

BLETIA VERECUNDA.

How does it happen that we so seldom see this fine old Orchid in bloom? Surely it cannot be scarce, for it is not difficult to grow, and the stock in the country ought to be considerable by this time, for it was, perhaps, the first Orchid introduced into English gardens, dating back as far as 1733. The fact is that Orchid growers do not put the value on its good

qualities which it merits, and it has to be content with a corner in general collections of plants in some of our old gardens, where it is not looked well after or cultivated, so as to bring it to that perfection which it displays when properly treated. We recommend all who have this fine old plant to look it up and give it careful treatment, as it is certainly one of the finest of terrestrial Orchids, its large branched spikes of fifty or sixty rose and purple blooms being much more beautiful than many a costly new-comer. All the *Bletias* thrive well potted in turfy loam to which a little peat and sand has been added. They are almost marsh plants when growing, but require but little water while at rest. For enumeration of the species see *Gardeners' Chronicle*, vol. xviii., p. 681, 1882 (fig. 26.)

A TRIP TO CHIRIQUEL.

LEAVING Kingston, Jamaica, on November 8, we entered the lagoon of Chiriquel on the 14th by a zigzag course between an island and a point of the mainland through a passage known to navigators as Boca del Drago, or Mouth of the Dragon, but locally known as "Boque's Mouth." Once inside, a broad expanse of water was before us almost deserving the term of inland sea, for certainly the term lagoon, as it is generally understood, is not an appropriate name for these waters.

On arrival at the settlement called Old Bank, at the north end of Providence Island, we found that a house was set apart for us. This was a well erected wooden building, clean, well-furnished, with polished floors, stained ceilings, and papered walls, and provided with many conveniences not to be looked for in houses belonging to the same class of people in Jamaica. The weather was fine, and the heat not at all oppressive, although the night temperature ranged from 80° to 85° Fahr.

It was arranged that we should pay a visit to the provision grounds of some members of the settlement early the next morning, and for that purpose a boat or "dug-out," capable of carrying eight persons, was to haul soon after daylight. Some half-hour afterwards we were afloat, and, propelled by two paddles only, were soon gliding at a rapid rate down the lagoon. There being no wind, the water was as clear as crystal, and at depths of 10 to 15 feet we could see the bottom covered with innumerable forms of aquatic organisms. An hour spent in this delightful occupation brought us to Mariana Creek. This was a channel about 10 feet wide, which, at a short distance away, was scarcely observable. It was covered with Mangroves, and reminded one very forcibly of the descriptions by Mayne Reid of the hiding places of *Indians* in some of the tales of our boyhood.

Further inland the creek narrowed somewhat, and we passed through tracts of marshy land covered with a luxuriant growth of the "Swamp Fern," *Aerostichum aureum*. From the roots of a Mangrove, some 3 feet above water, we collected plants of *Brassavola nodosa*, Lindl., a fine white-flowered Orchid, which yielded such a delicate perfume as to effectually banish the thoughts of a dead alligator we had recently passed. At the landing-place I observed a fine specimen of a *Coniferus* tree (*Pinus occidentalis*). On inquiry I found this had been brought from Bluefields, on the Mosquito Coast, and planted here by one of the settlers.

In the provision fields we found Plantains, Bananas, Pumpkins, Casava, Sweet Potatoes, Yams, &c., growing in the greatest profusion; the only enemy they appeared to have to contend with being the "We-we," or Umbrella Ant. This insect—although very destructive, it is true—did not appear to affect the general results of the cultivation, and the groves of Cacao on the outskirts of the field were in most instances untouched by it.

We found large colonies of this insect in every part of these islands, and it is without doubt in a great measure due to the labours of these little creatures, assisted by the numerous land crabs, that the probably once barren coral rocks which form the foundation of these islands are raised from sea-level to become fertile fields adapted for the production of food for the human race. Enormous trees from 50 to over 100 feet high were common objects, but their identification had to be deferred until reference had been made to authorities on the subject. Wishing to procure seed of one of these trees, I expended several cartridges from a good fowling-piece, in the endeavour

to bring down a few seed-pods, but fruitlessly, for the lower branches of this tree must have been at least 90 feet from the ground.

Plantains and Bananas produce large bunches, which meet a ready sale on the spot, at the hands of captains of trading schooners running to and from the Isthmus of Panama. "Sarse," the roots of a species of Smilax, known to commerce as Sarsaparilla, also meets a ready sale, large quantities being grown at various places in the lagoon, and not a little is produced and brought down by the Indians from the mainland.

The varieties of Cacao (Theobroma Cacao) were

spare no pains to introduce it into Jamaica, in which endeavour I am glad to say we were primarily successful, as growing plants reached Kingston in safety, and are now contributed to the Castleton Botanical Garden. The plant has not as yet been scientifically determined, but I may venture to state that it will probably prove to be Theobroma bicolor.

The tree itself is of a stout spreading habit, its trunk and branches being much thicker than those of the ordinary kinds; but it is not so erect in its mode of growth.

In the Cacao groves we saw many trees of the ordinary kind reaching a height of over 40 feet, while

as they would probably be at other seasons. The Aroidæ were very abundant, and covered the trunks of trees to the very top, one of these, particularly noticeable on account of the bright scarlet colour of its spadix, though situated at a height of 50 feet from the ground, was soon brought down by one of our guides; who easily reached it by help of the numerous "lianas" which surrounded the trunk.

Several *Carladovicas* also attracted attention, especially a small climbing one, with deeply 2-fid leaves, and also one of larger growth; they are probably *C. gracilis* and *C. latifolia*. *C. Plumieri*. The "Epiappa" of Jamaica was also abundant.

Ferns were plentiful, though the genera and species represented were few. One of the handsomest was *Lygodium digitatum*, a graceful climbing Fern which hung in immense festoons in many places. Several *Polypodiums*, *Adiantums*, and *Trichomanes* were found, among the latter the curiously proliferous *T. elegans*, which was met with in large quantities in deep shady woods and in several localities. *Lindsaya quadrangularis*, a Fern indigenous to Jamaica, but rarely found, was met with on our trip in one instance only. On our return from the morning's outing we examined the locality around the settlement in which we were residing, and it was found that little cultivation was attempted near the dwellings, but that groves of Cacao and Cocoa-nuts abounded everywhere, while many of the inhabitants took great pride in showing me their "Soooa" trees. This is a Palm well known under the name of *Guilicma speciosa*, Mart., but now referred by the authors of the *Genera Plantarum* to the genus *Bactris*. Wallace in his *Palms of the Amazon* thus describes it:—"This most picturesque and elegant Palm has the stem slender, cylindrical, and thickly set with long needle-shaped spines disposed in rings or bands. It reaches 60 feet in height, and grows quite erect, though in exposed situations it becomes curved and waving. The leaves are very numerous, terminal, pinnate and drooping, forming a nearly spherical crown to the stem; and the leaflets growing out of the midrib in various directions, and, being themselves curled and wavy, give the whole mass of foliage a singularly plummy appearance."

"The fruit is the size of an Apricot, of a triangular oval shape, and fine reddish-yellow colour. In most instances the seed is abortive, the whole fruit being a farinaceous mass."

"This Palm appears to be indigenous to the countries near the Andes. On the Amazon and Rio Negro it is never found wild." It is most commonly known as the 'Peach Palm,' from the similarity of its fruit, in size and colour, to some species of the genus *Amygdalus*, to which the Almond, Peach, and Nectarine belong.

The fruits are eaten either boiled or roasted, and have a flavour, to our taste, somewhat combining that of roasted Spanish Chestnut and Sweet Potato. As they are very wholesome I ate several, which I particularly enjoyed. They are said by Wallace to be "also ground up into flour, and made into cakes, which are roasted like Cassava bread, or the meal is fermented in water, and forms a subacid creamy liquid. Parrots, macaws, and monkeys, eat them greedily, but the latter gentry are prevented when in a wild state from obtaining them by the prickly nature of the stem.

The trees were growing at sea-level, and as the temperature is similar, I believe it would be an excellent plant to introduce for growing on the plains of Jamaica. As an article of food it would certainly be a valuable plant to the poorer inhabitants of this island, provided they could be induced to overcome their invariable prejudice against "Backra tings." The fruit will stand transport with great facility when ripe. I had a single one which I kept for some twenty-five days, and then it was found in a comparatively sound condition on my arrival in Jamaica.

Returning to our quarters in the evening we distributed among the people a set of economic plants we had brought with us from Jamaica. The most desired appeared to be Nutmeg, Pimento, and Mango, of the No. 11 variety, only a few of the coarser kinds of the latter being under cultivation. The Mango is a favourite object of attack with the "We-we" or Umbrella Ant, and special means have to be taken to guard the trees from their attacks. One of the most effectual methods appeared to be that of forming a tin trough around the tree, which was filled to a depth of 2 or 3 inches with coal tar, this plan was also adopted to preserve the dwelling-houses from the attacks of wood

FIG. 26.—BLETIA VERECUNDA. (SEE P. 140.)

numerous. The most commonly cultivated were the white and red-skinned varieties, but the green-skinned is a very heavy cropper, and produces Beans of excellent quality.

Chocolate of good quality is manufactured locally. The beans are first roasted, then deprived of their skins, and afterwards ground on a small, flat, porous stone, the crushing instrument, also of stone, being of a shape similar to a housewife's rolling-pin. We had frequent opportunities for testing this preparation, and often declared that, if travellers of the olden time tasted as good a mixture as it was our fortune to drink, it was no wonder that they described it as being "Food for the Gods."

Another distinct species of Cacao was met with, which, though of doubtful value as an economic plant, was of sufficient botanical interest to induce us to

the "Tiger Cocoa" seldom reaches more than 15 or 20 feet.

Several plants of a tree locally known as the "Wild Cocoa" were met with in the forest, and botanical specimens duly secured, which will probably prove the plant to be, not a *Coccoloba* at all, but a species belonging to the allied genus *Herrania*. The plant has but a small single stem, its leaves resembling at a short distance those of the common Papaw (*Carica papaya*). The pods are small, ten-ribbed, with roundish seeds, covered with a thick sweetish pulp, much sought after as a "bush" delicacy by the juvenile members of the community.

The most plentiful Orchid met with in our wanderings was *Catasetum tridentatum*, Hook. There were numerous other species, but as the generality of them were not in flower they were not so attract-

ants, by placing the same kind of trough around the piles on which the majority of the houses were constructed.

The people were very eager to obtain notes as to cultivation in regard to the plants distributed, as well as those in common cultivation, and being asked to do so I treated them to a short exposition on the first principles of horticulture, during which considerable wonder was excited by showing them the different parts of a plant, as seen through Browning's platyscopic lens.

We met with several groups of large and highly ornamental Palms; that locally known as the "Arpo," which I take to be a species of *Iriartea*, being very plentiful, as was also the "Raawa" *Socratea* (*Iriartea*) *exhoriza*, Mart.

The stem of the former plant possesses a hardened exterior which is about 1½ inch in thickness, very solid, and straight in the grain. It is used for making rods for striking the hawk's-bill turtle; an occupation which affords to the inhabitants a means of enjoyment by no means inappreciable, seeing that the tortoise-shell sells at the rate of 4 dols. per pound on the spot.

The "Raawa" has a much thinner exterior than the "Arpo," and though sometimes used for the same purpose, is not considered so serviceable, and is therefore relegated to the subordinate position of furnishing material for lathing, and flooring of native huts on the provision grounds.

What strikes attention to this tree, and renders it peculiar, is that the upper portion of each root is entirely above ground. They spring out of the stem, each successive one higher up the trunk than the last, and extend diagonally till they approach the surface, when they ramify into smaller rootlets and enter the ground. As fresh ones spring out from the stem, those which previously supported the tree rot, or die off in regular succession, thus leaving the entire trunk (often 60—80 feet in height) entirely supported by the concentric rings of outer roots, so that in old trees a full grown man may stand erect beneath the bole.

The aerial part of the roots is thickly covered with tubercular prickles—which is without doubt a provision of Nature for their defence against the attacks of herbivorous animals—and also serves the purpose of supplying the Indians with an efficient natural grater to enable them to reduce their Cassava to a pulp.

After travelling over a considerable tract of country we reached the east side of the island, or that exposed to the full force of the strong winds and currents, so prevalent in the Caribbean seas.

Approaching the "Ball's Mouth," on our homeward journey we turned a small headland, and found the rocks there abounding with enormous quantities of *Brassavola nodosa* in full bloom—in fact, the rocks were literally white with the expanded flowers of this beautiful species. To cultivators of Orchids it will be a fact of no little interest to note that these plants were growing on hard, barren rocks, washed at times by sea-spray, and shaded by the over-hanging Cocconut and other trees that were scattered along the beach. The same plant was also found as described, making its home on the clean stems or roots of trees, but nowhere was it found in such luxuriantness as on this rocky headland.

Our means of transit hence to the interior was by means of a splendid canoe, beautifully built or rather "dug out" of Cedar (*Cedrela odorata*). It measured 30 feet in length and 5 feet 6 inches in beam, having an added gunwale of some 8 inches, and strengthened by ribs at intervals of 18 inches. When close hauled she was a good sailer, but when before the wind she proved to be a regular "deerhound." We encountered several squalls, which made the sea very lumpy, and at times occasioned a dash of water over the side. We arrived off the bar at about 5 P.M., which we fortunately crossed with little difficulty in spite of the surf which covered it, only a very narrow channel of still water being observable, and on that also at times the rollers were breaking. In a few minutes afterwards we entered the mouth of the Wari-Biarra. *J. Hart, Jamaica.*

(To be continued.)

DAFFODILS IN THE PYRENEES.

On May 24, I left Bayonne to spend three weeks in the Pyrenees. As there were ladies in the party, we kept to the usual main route, Luchon, St. Saviour, Eaux Bonnes, Cauterets, and made expeditions to places within a walk or a drive of these headquarters. Garden flowers growing wild I expected to see in abundance, and I was not disappointed; but for Daffodils, I made up my mind that it would be too late, but this was a great mistake. The best places for scarce varieties of Daffodils in the Pyrenees are the high mountain pastures from 5000 to 7000 feet above the sea level, and their flowering season at these elevations is from the middle of May to the end of June, extending in some spots till the middle of July. Thus from the first appearance of *Pulsidium præcox*, which flowers in warm situations near Bayonne as early as the end of January to the latest Daffodils on the high mountains, the Pyrenees see these flowers for six months in the year. It must not be supposed, however, that they continue flowering for long in any one spot. On the contrary, at high elevations, as alpine botanists know, all the spring flowers come out at once, *N. pseudo-Narcissus* and *N. poeticus* coming out together at the same time as *Heptacapsa*, *Gentiana*, white *Asphodels*, and a mass of other spring flowers whose flowering in our ill-defined climate extends over at least three months. It is this simultaneous flowering which is so favourable to the formation of those hybrids which are supposed to be found in several parts of the Pyrenees. Before leaving England, and whilst in France, I collected from books, from tourists, from local botanists, and from guides all the information I could about Daffodils in the Pyrenees. I had supposed that one had only to go to the Pyrenees to be surrounded on all sides by meadows and hillsides filled with Daffodils. But I found that the nearer I got to the mountains the less I could hear about these flowers. Guides knew absolutely nothing about them. At Bayonne an old gentleman, supposed to be a good botanist, but who seemed just to know that there was such a thing as a flower called a *Narcisse*, was asked by me whether he had ever heard of hybrids of them. He replied, "Ah! Monsieur desire des hybrides! Ils sont très rares; il faut aller très loin et monter très haut pour trouver des hybrides!" but as for the special mounts which were required I could learn nothing from this oracle.

The lower slopes, generally very steep, of the Pyrenees, where the ground can be cleared enough to be turned into meadow land, are always artificially irrigated by some of the countless streams which run down the mountain sides, and these flowery meadows extend, as far as trees and rocks allow them, to a height of 3000 or 4000 feet. In the neighbourhood of Gavarnie these irrigated meadows are full of Daffodils, but in many places I searched them in vain for traces of a Daffodil leaf. It is in the high pastures, above the irrigation, where the most promising hunting-ground is to be found. These high pastures are often difficult to find without a guide, especially in wet weather, such as prevailed during the whole of my visit, when one has to walk amongst thick forests on very steep mountain sides, through drizzling clouds. After two or three hours of such walking, when it would seem from the cold and the snow that one had passed all such flowers as Daffodils, it is a pleasant surprise to come suddenly upon green flowery pastures, though by no means all of them contain Daffodils.

During my stay I spent seven or eight days in exploring mountains at the elevations I have mentioned, and when I found that Daffodils were still in flower I searched chiefly for them. On one such pasture near Eaux Chaudes, indicated in a French botanical work as good for hybrids, I found all the leaves eaten off by sheep, and collected a number of roots, which I think are *Narcissus poeticus*, but I could not find a flower. On one or two mountains I searched in vain: on one I found a few hybrids, evidently between *N. poeticus* and *N. pseudo-Narcissus*, not unlike *N. incomparabilis*, but not so fine. I obtained three or four different varieties of Daffodils, but all of them I had already. I neither saw nor heard of any rush-leaved Daffodil of any kind on the mountains, except *Juncifolius*, which abounds, growing with *Pseudo-Narcissus* in meadows near Gavarnie, forming hybrids with it; but all the flowers there were quite past—early in May is their season. Near Luchon I found *N. muticus* only in bud, and on that day and on another I was out in a snowstorm—a

common event in June—at the elevation at which Daffodils flower at that season.

Having thus given briefly my own experience of Daffodils in the Pyrenees, I will end by suggesting that any who make the collection of these flowers their object had better try other and less-explored grounds. The Pyrenees are 250 miles long, and about 30 miles across, and are more broken up into independent mountains than any chain in Europe. In these 7000 square miles the hunting-ground for adventurous collectors is inexhaustible.

I was told by M. Bédère, of Gêdre, that the Pyrenees to the east of the sources of the Garonne contain a greater variety of Daffodils, especially hybrids, than the western part of the mountains. And it must also be borne in mind that the larger and more sunny half of the Pyrenees is situated in Spain, and is visited by few English owing to the inferior accommodation, although one Daffodil, the pretty white *moschatus*, has not only been found, but I believe already exterminated on that side; and for this reason I should always refrain from publishing the exact spot of any rare variety. The best month for searching the high pastures is decidedly from the middle of May to the middle of June. *C. Wolley Dod, Edge Hall, Malpas, June 21.*

The Flower Garden.

HARDY PLANTS.

POLYANTHUS and Primrose seed may still be sown in a moist warm temperature, and the plants will bloom the following April. Sow the seed in pans or boxes; when the plants are ready to handle prick off into other boxes, still retaining them in the same pit or frame; and when the plants have developed four leaves, harden off and afterwards plant out in rich soil.

The rockery should now be carefully examined, and all dead leaves and decayed flower-stems removed. Protect any of the more tender subjects from the direct rays of the sun. Sprinkle the stones and other surroundings with water after the sun has gone off for the day. This will freshen up the plants, and enable them to withstand the scorching heat of the following dry. See that none suffer for lack of moisture. *Fuchsias* look well trained amongst old roots, and *Petunias* have a good effect in the rockery.

PROPAGATION OF TENDER BEDDING STUFF.

Preparation should now be made to carry out the propagation of the subjects to be used for the embellishment of the flower garden next year. Such plants as *Iresine*, *Alternanthera*, *Coleus*, *Mesembryanthemum*, *Verbena*, *Petunia*, *Heliotrope*, *Tropæolum*, &c., should be got in first. These are best propagated without artificial heat, and will winter more satisfactorily than those struck later in the year. Get a cold frame in readiness by putting in a few inches of coal ashes, tread or beat these until they are hard, on this place from 6 or 8 inches of cocconut fibre for plugging. The best sizes of pots to winter these subjects in are 4½ or 3½. Have the requisite number of these got ready by washing or dry rubbing them. Much time will be saved in crocking if the crocks to be used are put through a series of sieves. First use one of three-quarter inch mesh, what does not pass through this will do to place over the holes in the pots; then a half-inch, and a quarter-inch. If these are placed in the bottom of the pot in the order mentioned, with a little dry moss on the top it will effectually prevent any soil from getting into the drairage. This is very important, as the plants have to occupy the same pots until the stock of cuttings has been secured the following spring. Get some loam, leaf-mould, and sand, in about equal quantities; fill the pots to within an inch and a half from the top; on the top of all place a layer of good sharp sand (river sand is to be preferred, although other kinds will answer the purpose). Select the young shoots which spring from the centres of *Verbenas*, *Heliotropes*, *Petunias* and *Ageratums*, as these will root quicker and grow more freely than hard blooming wood. It is not necessary to waste time making cuttings of most soft-wooded plants, as these can be taken off about the requisite length as they are

collected. The principal thing to guard against is letting the cuttings become withered in any degree. They ought to be pricked into the pots as expeditiously as possible, and the pots as they are filled, ought to be taken to the frame and plunged up to the rim; they should then receive a good watering through a fine rose. The sashes should be kept closed and well shaded with mats until such time as they have emitted roots. They should then be gradually inured to the light, and a little air admitted, increasing the quantity every few days. As soon as they are thoroughly rooted they should only receive the protection of the lights during heavy rains, or in case of frost, until it is time to house them for the winter. Thus treated on the hardy system they will winter with slight loss if proper attention is bestowed upon them. *W. M. Baillie, Luton Hoo Gardens.*

PLANTS AND THEIR CULTURE.

BULBS.

A BATCH of *Amaryllis* may now be put in the Pine-stove or forcing-house. *Crimums* should not be overlooked; these and the varieties of *Eucharis* are favourites always. The first instalment of Roman *Hyacinths* should be potted, or if wanted for cutting only, the bulbs may be planted thickly in pans or boxes, and the flowers will come in during the dull month of November in abundance. *Lachenalis* are amongst the most valuable of spring flowering bulbs, and deserve more attention than is generally paid to them. Now is the best time to shake out and repot them in fibrous loam, leaf-mould, and sand, potting firmly, leaving the tips of the bulbs just out of the soil. *Lilium auratum*, *L. lancifolium*, and the varieties of *L. rubra* which have been retarded should be brought forward and exposed to more light by placing them in the greenhouse or cold pit.

Seeds of annuals should be sown without delay, such as *Mignonette*, dwarf *Senbious*, *Conflower*, a few *Ten-week Stocks*, *Godeitias*, and the various varieties of *Rhodanths*, dwarf *Zinnias*, and *Nemophila*, these will be found to be of great service late in the autumn. *A. Evans, Lythe Hill.*

FRUITS UNDER GLASS.

PINES.

It is time now to proceed with the potting, arranging and plunging of the plants in their autumn and winter quarters. The first step to be taken in this direction is to remove the suckers carefully from the plants which have been fruiting during the past summer, and place them in a corner of the potting-shed, out of the way of potting operations. The old stools, except of those varieties, such as *Providence*, *Charlotte Rothschild*, and *Smooth-leaved Cayenne*, which are shy in producing suckers, can be committed to the rubbish-heap, the soil in which they were growing to the waste-soil heap, the crocks saved for future use, and the pots washed for the reception of next year's fruiters. The top-dressing and potting of these should at once be proceeded with, the beds of spent tan or leaves being in the meantime removed and fresh plunging material supplied; the interior of Pine-houses and pits washed with hot lime and the woodwork and glass with water. Many of the strongest growing plants which were put into their fruiting-pots last spring, and afterwards plunged in the ordinary way in the succession-house, will be fruiting now. These plants should be taken out of their summer quarters and have between one and two inches of the surface-soil, and a few of the bottom leaves removed, the former with the assistance of a pointed Oak stick working it rather deeper round the edge of the pots; then remove carefully any suckers that may be attached to the plants, and top-dress with rough sandy loam. Ram the same well together with a wooden rammer as the work proceeds. Then select and pot in their fruiting (10 or 11-inch) pots the necessary number of plants to fill the house for fruiting next summer and early autumn.

POTTING THE PLANTS.

The pots should be efficiently crocked by putting large pieces of potsherd in the bottom and smaller ones on the top to the depth of 2 inches, finishing off with a sprinkling of fresh soot and a few pieces of

turf, grassy side down. Fibry sandy loam which has been cut and stacked for twelve months, is the best kind of soil for Pines. This should be chopped down with a spade as required for use, adding thereto crushed bones, fresh soot, and small charrenal at the rate of a 10-inch potful of each ingredient to a barrowful of loam, the whole being well mixed before being used. The plants should be turned carefully out of the pots, the drainage and a few of the lower leaves removed, and the surface and sides of the ball of earth and roots loosened slightly with a pointed stick, and any soil not permeated with roots removed. They should be let down to the bottom leaves in potting, and the soil, which should be sufficiently dry not to adhere to the sticks, be rammed firmly round the roots with flat and round rammers, as the space admits, taking care that plants are made firm about the collar. Over-potting is to be avoided, but a space of 1 or 2 inches between the ball of the plant and the pot will not be too much, but quite sufficient for all healthy plants in their several shifts from the sucker to the fruiting-pot. In potting suckers it will be necessary to remove a few of the bottom leaves, so that the roots coiled round the stem under the leaves may push more readily into the soil, and about half an inch of the base of each sucker should be cut clean off with a sharp knife before being potted.

PLUNGING THE POTS.

The plunging material having been well trodden together, plunge the fruiting plants from 2 to 2½ feet from the centre to centre, keeping the tops as near the glass as can be without their coming in actual contact with it, and give the smaller plants space in proportion to their size. Give sufficient clean tepid water to settle the soil about the roots, shade the plants from bright sunshine until the roots have taken to the soil, and damp them overhead every afternoon at shutting-up time. *H. W. Ward, Longford Castle.*

HARDY FRUIT GARDEN.

PEACHES AND NECTARINES.

In order to give the fruit every advantage to finish well the trees should now be regularly gone over every week and all lateral growths pinched out. To induce a high colour on the fruit they may be exposed to the sun a little by cutting some of the foliage in half near the fruit, or tying it back with matting. Nevertheless, the requirements of varieties should be studied when carrying out the work; tender-skinned varieties should not be exposed to the influence of the weather so much as others, and as a rule it is not advisable to expose any of them to the same extent as would be considered beneficial under glass, as I have seen fine fruit greatly bruised and disfigured by heavy storms when approaching the ripening stage when fully exposed to the weather. If the final thinning of heavy crops has not yet been attended to no time should be lost in finishing such work, bearing in mind that a good crop, judiciously thinned, according to the individual strength of the trees, is one of the greatest inducements to perfect ripening of the wood, and an excessive crop the reverse.

On healthy trees constant syringing may now be discontinued, rather administer a good washing, say once a week. As soon as the fruit commences the second swelling several soakings of manure-water applied to the roots will greatly add to the size and quality of the fruit. In the absence of manure-water a good sprinkling of guano applied under the mulching, and lightly pricked into the soil immediately prior to giving a soaking of clean water will supply the necessary stimulant. The mulchings should be turned over occasionally in order to allow the rain and artificial waterings to pass rapidly and evenly through them, and the less they are trod upon the better.

OTHER WALL TREES, &c.

Morello Cherries this year are carrying a splendid crop, and a small-mesh net should be hung over the tree to protect the fruit from birds. Still continue to examine the points of the shoots, and apply powdered Tobacco should blackly be detected. Sweet Cherry trees from which the fruit has been gathered should be well syringed with soap or tobacco-water if fly has not established whilst the fruit was ripening. If not already attended to, wall Pear trees, Apples on trellises, &c., should have the breastwood spurred back, taking care not to leave the spurs too long. The same remarks apply to standard and other shaped trees, proceeding with the earliest varieties first. *G. H. Richards, Somerley, Ringwood.*

The Kitchen Garden.

PRICKLY OR WINTER SPINACH.

PREPARATION should now be made for the main sowing of this, which should take place, according to the locality, from the first to the third week in August. A well drained, sheltered border facing south would be the most suitable situation, but in any case the site must be an open one and exposed to the sun, being to a certain extent sheltered from cutting winds, and also well drained. A moderately rich light soil, that has been manured for a previous crop, is to be preferred; which, after, having been dug over and well broken up, should be formed into ridges, in rows from 20 inches to 2 feet apart.

In a few days, and after the soil has become firm and settled, drills 1 inch deep should be drawn on the surface of the ridges, and the seed sown thinly, and lightly covered with fine soil, and afterwards made firm and even with the back of the spade. Thinning the young plants should be resorted to as soon as they are large enough to handle, and before they become drawn or overcrowded; in the first instance the plants should be singled out and afterwards finally thinned to a distance of 6 inches from plant to plant. After-treatment will consist principally of keeping them clear of weeds, and of applying during the earlier stages of growth an occasional light top-dressing of lime and soot.

PARSLEY.

If any deficiency is likely to arise in the supply of Parsley, no time should be lost in making it good, by transplanting strong plants from the earliest sowings on to sheltered dry borders, and into cold frames, where protection can be readily afforded during winter, shading and watering will be necessary in both cases during hot, dry weather, and until the plants have taken root. Now also would be a good time to establish some in well-drained pots or boxes for indoors work, transplanting into firm rich soil from 4 to 6 inches apart. Sprinklings of soot on the surface, or watering with soot-water, is highly beneficial for the production of good Parsley.

CUCUMBERS.

As the days shorten, those growing in dung frames will require less atmospheric moisture, especially during damp and cloudy weather, and at closing time of an afternoon; any necessary watering or syringing would, therefore, be better applied after this date in the early part of the day, and as soon as it is practical to open the frames. The thinning, stopping, and removal of all surplus shoots and decayed leaves, must be attended to, and where the supply depends, and has to be continued as long as possible from the frames of this description, the old linings should be turned over and renewed from time to time, to encourage and maintain a steady bottom-heat, which will be essential and necessary in keeping the plants in a growing and healthy condition. As regards saving seed, plants that have been somewhat heavily cropped previously are the best for producing it. For a succession to those in dung frames, and for a supply of early winter Cucumbers in pits heated by hot-water pipes, plants should be raised at once of approved varieties, such as *Telegraph*, *Cardiff Castle*, *Dickson's Favourite*, &c., and preparations be made in the way of cleansing, repairs, &c., to the structures they are to occupy.

TOMATOS.

Young plants that are being grown on for giving a supply of fruit during the autumn and winter months should be encouraged in every possible way by liberal treatment to get well established, and to cover the trellis or spaces allotted them before the autumn, the flowers and surplus growth in the meantime being removed. Older plants, however, that were planted in early spring, and are still in bearing, answer well for this purpose, and in this case should be cut back rather freely, and all the fruit remaining on them removed; this operation should be performed not later than the last week in August; as much of the old soil as possible, with the exception to the plants, should also be taken out and replaced with fresh compost, the house and plants thoroughly cleansed, and afterwards a brisk heat and growing temperature maintained to induce a free growth.

GENERAL WORK.

will chiefly consist in giving attention to growing crops in the way of earthing up and in putting support to subjects likely to be injured by strong gales, in filling up and making good any vacancies amongst *Cabbages*, *Spinners*, *Broccoli*, &c., the final planting out of the same, and also of late *Celery*. Make provision for salads by sowing *Radishes* and *Cabbage Lettuce* on warm borders; also a good sowing of *Endive* and the necessary quantity of *Mustard and Cress*, and a small bed of *Chervil* to stand the winter. *John Aulten, Witley Court.*

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	Aug. 2	{ Northampton Horticultural Society's Summer Show (two days)
TUESDAY,	Aug. 3	{ Flower Show and Sale at Leicester
THURSDAY,	Aug. 5	{ Sale of Imported Orchids from Mr. F. Sandler, at Stevens' Rooms
FRIDAY,	Aug. 6	{ Sale of Imported Orchids, at Pradmore & Morris' Rooms
SATURDAY,	Aug. 7	{ Mallock Bath Horticultural Society's Show.

AMONG the many encouraging signs of the progress of biological science may surely be counted the increased attention that is now being paid to the PATHOLOGY OF PLANTS. Enticing as the study was to those of old on account of the apparently mysterious origin of many plant diseases, it became no less attractive as fortress after fortress was besieged and taken with the weapons and methods afforded by modern microscopes and physiology. Moreover, however little hope that we should ever establish a system of vegetable hygiene we have sustained the pioneers in this department of botany, it is impossible now to overlook the important results attained and daily being attained from the scientific study of the physiology of ill-health in plants: to say nothing of the valuable contributions to morphology which have accrued from the investigations of the fungi, especially those which are the causes of diseases. From the standpoint of economics, we need only point to the prophylactic treatment of seeds, first rendered possible by the scientific elucidation of the causes and progress of such diseases as the "bunts," &c., the saving of money which followed the explanation of the "laying" of Wheat. Every one knows what a different aspect is presented by the diseased conditions due to "rusts," "mildews," &c., now that close and laborious investigations have elicited the life-histories of these fungi; and similarly with "Witch's Brooms," "Fingers-and-Toes," and numerous other malformations. Who could have foreseen the importance of the facts now to hand as regards the production of chlorophyll, and the relations of temperature, light, iron, and so forth, to its formation; or the bearing of discoveries respecting the parts played by potassium, calcium, and other salts in the plant? Or, again, we may remind the reader of the destruction of seedlings by species of *Pythium*, and of woody tree trunks by *Hymenomyces*, as showing that while the work is by no means ended—indeed, it has but just begun—the results are already of the highest importance to humanity.

It was apparently a simple discovery that sunshine may be too strong for a plant; and it seems an obvious generalisation that a plant does not necessarily keep its health in a situation where the annual rainfall, and all other circumstances, are like those of its home, except that the rainfall is somewhat differently distributed. Nevertheless, it is now well known that such facts and such generalisations assume very different proportions, as to results, according as they are in the hands of one who has been properly taught the elements of the physiology and pathology of plants, or of one who merely seizes the empiric item of knowledge, but does not know how to apply it in the field or in the forest, and to perceive its bearings on preventable diseases in plants.

In view of the rapid progress which is being made in scientific botany applied to agriculture and forestry, a second edition of SORAUER'S *Handbook*, in an enlarged and improved form, already noticed at p. 44, *Gardeners' Chronicle*, July 10, 1886, is a welcome addition to the botanical library; for, although FRANK'S able treatise was published in 1880, much has been discovered and advanced since that date.

One of the most remarkable features in the book is the recognition of the facts of variation in connection with the phenomena of disease. Starting from the incontrovertible position that

for the most part the occurrence of a disease (*i.e.*, disturbance of the structure and functions of an organism of such a nature as to threaten its existence) depends on two factors—first, a cause or agent external to the plant, and, secondly, a condition of affairs within the latter such that but little resistance is offered to the inroads of this external cause or agent. SORAUER then elaborates the facts of variation as bearing on the differences in behaviour of different plants towards disease-producing influences or agents. For instance, the sudden removal of all the leaves on an actively growing plant may give so terrible a shock to the whole of the functions that the plant sickens and dies; but the end may be hastened by the co-operation of unfavourable circumstances—*e.g.*, poor soil, bad weather, &c.—which would not have otherwise sufficed to kill a vigorous plant not thus weakened.

As another example we may take the following:—Some individuals among a number of plants are more liable to suffer from frost than others, although both are exposed to similar conditions; it is known from experiments that frost injures the organs of plants more rapidly and to a greater extent when they are full of sap than when they are less succulent.

Then again, with certain fungi at any rate, it appears that some conditions of the host-plant may favour the establishment and rapid spread of the devastating mycelium. For instance, a germinal tube may penetrate more rapidly through cellulose walls which are very watery, or through stomata which are more widely opened than is at other times the case.

Such considerations bring the author to the discussion of the vexed question of "predisposition" to disease on the part of plants, and, putting the case shortly, he commits himself to the view that predisposition (in the sense illustrated above) exists.

To this point the closest possible attention should be paid, if misunderstandings are to be avoided such as have arisen in the past, and such as are still possible; loose thinking in this connection may seriously affect the position of vegetable pathology.

Given a fungus-thread or hypha entering the stoma or air-hole of a leaf in order to vegetate in the tissues within the leaf, it is obvious that, *ceteris paribus*, any changes in the environment which cause the stoma to open wider at the critical period of entry, or which promote the growth in length, branching, or vigour generally of the germinal thread, may favour its ingress to the tissues, and hasten the spread of the spawn and of the disease caused by it; similarly, any changes in the environment which promote the elongation of a young organ and render its cell-walls more watery, may favour the penetration of a thread boring through those cell-walls.

In a certain sense, undoubtedly, a host-plant thus circumstanced may be referred to as more susceptible to the disease-producing agent, and therefore to the disease, just as a watery young branch may be spoken of as more susceptible to frost; but this is a very different matter from what has been implied by the phrase "predisposed to disease," as SORAUER, it is true, recognises to some extent. The author does not improve matters by the distinction between "normal predisposition" and "abnormal predisposition." The latter is illustrated by the case of a tree injured by frost, cracks or wounds being formed of such a nature that fungi (otherwise unable to establish themselves in the tissues of the tree), settle on the wound, and emit hyphal threads which penetrate to destroy the tissues. We would rather see the word "predisposition" abandoned altogether in this connection, lest some genius extends its meaning so as to speak of the predisposition of a garden for weeds. The word has gathered an

unfortunate mass of old ideas around it, and such words are often obstructive—otherwise, there can of course be no objection to the ideas which SORAUER wishes to denote by it, and as a matter of fact, they are not new.

— ODONTOGLOSSUM VEXILLARIUM.—The fine plant (fig. 27), reproduced from a photograph taken on the occasion of its being exhibited by Mr. J. DOUGLAS, gardener to F. WHITEBOURNE, Esq., is perhaps one of the finest examples of this beautiful Orchid to be found in this country, carrying as it did at that time 290 blooms, borne on forty-seven spikes. Mr. DOUGLAS, who is very successful in his management of Orchids generally, has shown himself to be thoroughly at home with this species. The plant is not "made up," having been bought as a small plant about ten years ago. The method adopted in its culture is identical with that recommended by Mr. B. S. WILLIAMS, namely to grow the plant in the Cattleya house during winter until the flowers appear, when it should be removed to a cool house, where the flowers will remain in good condition for a long time. In such a house the plant may stand the whole summer, taking care never to let it dry at the root. As it is amenable to this treatment, this Orchid is suitable for placing with other flowering plants in the conservatory.

— NEW PEAS CERTIFICATED.—At a meeting of the Fruit and Vegetable Committee held at Chiswick recently—present, C. SILVERLOCK, Esq., in the chair; Messrs. WEIR, SUTTON, MILLS, NORMAN, DENNING, WARREN, LAW, and BARRON (Secretary)—the collection of Peas growing in the garden was examined, and First-class Certificates awarded to the following:—

Fame (Eckford).—A green wrinkled Marrow, with large deep green well-filled pods; height, 5 feet.

Empress (Eckford).—White wrinkled Marrow, well-filled large broad pods, vigorous grower; height, 5 feet.

Seedling No. 16 (Wildsmith).—White wrinkled Marrow, very long pods, strong grower, good cropper; height, 4 feet.

President Garfield (Veitch).—White wrinkled, large well-filled pods, heavy cropper; height, 3 feet 6 inches.

Seedling, unnamed (Sharpe & Co.).—A dwarf, wrinkled, blue Marrow.

— "BEES AND BEE-KEEPING."—Mr. CHESHIRE'S work on this subject is remarkable for the elaborate details it gives, not only of the anatomy and physiology of the bee, but of flowers also. A description up to date of the embryo sac and its contents is what we should not find in many gardening books, but it is not thought out of place in a treatise on bees. Mr. CHESHIRE'S book is published in monthly parts by L. UFFCOTT GILL.

— "THE ORCHID ALBUM."—The plants figured in the last number are:—

Phalenopsis Stuartiana, t. 237.

Saccolabium Blumei var. *Russellianum*, t. 238.—A very fine variety, with the lip of a dark violet colour.

Lelia albidia var. *bella*, t. 239.—A variety with the segments creamy-white, tipped with lilac; lip yellow, with a broad band of rosy-magenta round the middle lobe.

Oncidium Marshallianum, t. 240.—A cool-house Orchid, requiring a moderate amount of moisture, and very little shade.

Appropriate cultural details accompany every plate of this useful periodical.

— PAUL NEYRON.—This, says the *Revue Horticole*, is the biggest Rose known. It was raised by M. LÉVET between Victor Verdier and Anna Diesbach in 1869. For those who like a Rose as big as a Paeony this is the one, but no doubt it is effective and suitable for particular purposes. As to size Ulrich Brunner runs it hard.

— NARTHECIUM OSSIFRAGUM.—Mr. WARE sends us a box of flowers of this pretty and interesting wild plant, common enough in boggy places, but rarely seen in cultivation, though amply worth growing.

— VITALITY OF CYCADS.—In the *Deutsche Garten Zeitung* Dr. WITTMACK gives an instance of the longevity inherent in trunks of the genus *Cycas*. He says:—"In the nursery establishment of Mr. J. C. SCHMIDT, at Erfurt, Germany, there have existed for the last eight years two trunks of *Cycas media*, having a height of 13 and 16 feet respectively. These two trunks, forming a portion of a large cargo brought from Queensland, were on their arrival in 1878 considered to be quite dead, but, for the sake of curiosity, they were, nevertheless, planted in the ground.

is native to East Africa and parts of India, and therefore a very likely plant to occur in Mauritius. Its habit is like that of *Hydrocotyle asiatica*, for which, in the absence of flowers, it might on a cursory glance be mistaken.

— JAPANESE PEPPERMINT.—The great demand for menthol, says the *Pharmaceutical Journal*, that has arisen during the last two or three years, has caused a great increase in the cultivation of Peppermint in Japan. According, however, to a statement

from almost white, a delicate salmon-pink, and red and purple splashed on white grounds; altogether a fine lot. Messrs. CARTER & CO. state that there are between three and four thousand pots of these plants now in bloom at their Forest Hill Nursery. The blooms are fine and large, very regular, and decidedly attractive.

— GENIP AND GENIPA (see p. 122).—An error crept into our report of Mr. MORRIS' interesting lecture on tropical fruits in our last issue. Mr.

FIG. 27.—ODONTOGLOSSUM VENILLARIUM. (SEE P. 144.)

(From a photograph of a plant shown by Mr. J. Douglas at the Botanic Gardens, Regent's Park, June 7.)

Imagine the astonishment of everybody concerned at finding that these 'mummies' had suddenly returned to life, their crowns ornamented with wreaths of thick foliage, which is now completely grown and affords a most imposing sight!"

— FLAT ISLAND.—Mr. HORNE has published a list of the plants found by him in this island—a dependency of Mauritius; they comprise 122 species, sixty-nine of which are considered indigenous, thirty-eight naturalised exotics, and fifteen cultivated. The only novelty is *Ipomoea reniformis*, which has not been previously recorded from Mauritius, but which

in a circular issued by Messrs. COCKING, of Yokohama, nearly the whole of the new plantations have been laid down—through ignorance or carelessness—with a very inferior variety of this plant, known among Peppermint growers as the green kind, which yields under unfavourable conditions an oil having a rank turpentine or camphoraceous smell.

— BALSAMS.—Messrs. J. CARTER & CO., 11 High Holborn, London, have kindly sent us a box of specimen blooms of the Challenger strain of Balsams. The flowers are of many colours—white, bright scarlet, scarlet with white marbling, several purplish and mauve shades

MORRIS wrote, "The Litebi, Rambutan, and Lognan of the East Indies are co-related by the Genip of the West Indies, all of which belong to the same natural order Sapindaceae." The insertion by us of the words "Genipa americana" is an error which destroys the point of Mr. MORRIS' remarks, which was to show the co-relation of East and West Indies in the matter of fruits. The confusion, for which we are alone responsible, arose from our overlooking the fact that the Genip and the Genipa are two different things. Neither is much known this country, the Genip indeed, under that name, hardly at all. The Genip of the West

In'ties is, as Mr. MORRIS rightly stated, a Sapindaceous plant, and is botanically named *Melicococa bijuga*, while the *Genipa*, or *Genipap*, is the fruit of a Rubiaceae plant, *Genipa americana*, and native to Brazil. This mistake emphasises the necessity for the employment of technical names in preference to, or at least in addition to, the vernacular ones. The fruit of *Melicococa bijuga* is mentioned in many books of reference, and is well known to botanists; "*Genip*" occurs but in few.

— *OSYRIS ALBA*.—M. PLANCHON has lately mentioned this as an occasional parasite on the roots of the Vine, but not to such an extent as to do any material damage where weeding and hoeing are properly attended to, as they are in the vineyards.

— THE COLONIAL EXHIBITION. — The literature pertaining to this Exhibition is not unnaturally extensive, and for the most part it is excellent. Each colony has caused to be prepared a short account, which generally includes a summary of the history, foundation, government, physical and natural features, as well as commercial products of the colony. In this way an amount of authentic information has been got together which can rarely if ever have been made so accessible before. Advertising more especially to matters in which our readers are more directly concerned, we note an excellent descriptive and classified list of the woods of Queensland, by Mr. F. MANSON BAILEY, the Colonial Botanist. The Ceylon catalogue, in addition to a mention of raw products generally, has a list of the drugs and of the timber trees of Ceylon, to accompany the specimens exhibited by the Director of the Royal Botanic Garden. The New Zealand catalogue also comprises a list of native woods, but not so usefully arranged as in some other cases. New South Wales issues a general statement of the progress and resources of the colony, but no list of products. The Cape of Good Hope catalogue includes descriptive lists of medicinal plants and of woods. The official handbook of Natal deals with generalities, and the same may be said of Fiji, a special feature of which, however, are the elaborate meteorological details, which will be useful for future reference. South Australia furnishes an excellent general account of the nature, history, and products of the colony. The Victorian handbook is remarkable for the copiousness of its illustrations. Canada has an admirable summary of its history, productions, and natural resources, accompanied by two large-sized maps, which enable us to realise the extent of the Dominion, and the splendid prospects in store for it. The special British Guiana catalogue is very interesting to peruse, and the notes on timbers instructive, though here, as elsewhere, the use of popular names, compulsory in this case, is a great drawback. The notes on the Straits Settlements contain an interesting history of the colony, but little detail as to its products. The West Indian counts so far seem least well represented in this enumeration of literary exhibits. Tasmania, for some reason or other, does not appear to be represented at all in this Exhibition. We are frequently asked for give information and advice to intending emigrants—a task which, at least so far as the counsel goes, we rarely comply with, for reasons that will be sufficiently obvious; but since the opening of the Colonial Exhibition we have referred all applicants to the Exhibition and to the official reports. We allude to this matter because in our judgment it shows the desirability of securing a permanent Colonial Museum, where every applicant may find the information he is in search of.

— BARBADOS. — In the court assigned to the representation of the products of this island in the Colonial Exhibition hangs overhead a large branch of a Fig sending down roots from the under surface of its branches. These roots branch towards their free ends, and so a wig-like appearance is produced, whence the name of the island was, it is stated, derived.

— TOBACCO GROWING IN LONDON. — A correspondent has obligingly furnished us with leaves of various kinds of Tobacco grown in the vicinity of the Regent's Park. *Nicotiana Wigandoides* has ovate-oblong leaves, of a pale green colour, 2 feet long by 14 inches in width; *N. atropurpurea grandiflora*, has leaves of a deeper green colour, broadly ovate, 23 by 16 inches; *N. macrophylla gigantea*, has leaves rather widest at the bottom, of a rich dark green, and measuring 24 by 16 inches. All three were good samples of rapid succulent growth, but

rather destitute of the glandular hairs on which the fragrance depends. If the autumn should prove light enough and hot enough, however, the peculiar qualities of the Tobacco may yet be developed. We take the names as they were given to us. Even as foliage plants the specimens were very handsome.

— CLADOPTOSIS. — The fall of the leaf is due to the formation of a generative layer of cork cells at right angles to the plane of the leaf, the vessels of the wood and bast not being affected. The leaf is only maintained in connection with the branch by the vascular threads, which are readily snapped. In the branches of the white Poplar, which fall off very regularly, a change, according to M. LECLERC DU SABLON, occurs in the cells above the newly-formed cork layer; the cell-walls become liquified and gelatinous, and the branch falls. The mechanism of cativatisation [the formation of the cork-layer] is the same in the two cases, but that of the actual fall is very different.

— NATIONAL CARNATION AND PICOTEÉ SOCIETY (NORTHERN SECTION). — The annual exhibition of northern grown flowers will take place at the Botanical Gardens, Old Trafford, on Saturday, August 14. This is a rather late fixture, but the flowers are late in the North; still a good average bloom may be expected, and an interesting exhibition. Bright and warm sunny weather is much needed by growers in the Midland and Northern Counties.

— PETER LAWSON & SON, LIMITED. — According to a circular which has reached us the directors announce that after providing for discounts, abatements, &c., the accounts show a surplus for the past year of £3053 4s. 8d., which, together with the sum of £5233 0s. 3d. brought forward from last balance, leaves £8286 4s. 11d. at the disposal of the directors, out of which it is proposed to pay a dividend of 10 per cent. per annum on the paid-up capital, free of income-tax, payable on September 1 next. This will absorb the sum of £1750; and it is further proposed to write off £400 from machinery, fittings, and furniture, £750 from seed stocks, for contingencies, and carry forward the balance, viz., £5286 4s. 11d., to next account.

— SOY. — We do not suppose that there is much of the Soja Bean in the alleged mixture of treacle and salt which does duty as Soy. The real article, however, must have a distinct diastetic value as a solvent of starchy and farinaceous foods. Messrs. STINGL and MORAWSKI, according to the *Journal of the Pharmaceutical Society*, confirm the presence in the Bean of a very active diastatic ferment, which places it in respect of saccharifying power beyond any other fruit at present known. This ferment converts about two-thirds of the starch upon which it acts into sugar, and one-third into dextrin. In this respect it resembles the action of the diastatic ferment of un-malted Barley, and differs from that of malt, which forms more dextrin and less sugar the smaller the quantity of malt in proportion to the starch upon which it acts. The Bean itself contains only a very small quantity of dextrin, the extractive being a mixture of different sugars (about 12 per cent.), distinguished by their easy fermentability. Messrs. STINGL and MORAWSKI consider that the small amount of starch in the Soja Bean, and the minuteness of the granules, are explained by the presence of the energetic diastatic ferment.

— AGULLEGIA SKINNERI. — Mr. SERENO WATSON notes that this plant has been collected in South-western Chihuahua, Mexico, by Dr. EDWARD PALMER. The plant, which was originally introduced by seeds collected in Guatemala by G. URE SKINNER, has never before been collected. Mr. WATSON remarks that as it has proved to be perfectly hardy in English gardens, a tropical habitat is not probable; but this will not apply in all cases. The common blue Passion-flower is hardy about London, but is nevertheless a native of South Brazil.

— PLANT EXCHANGE IN CHINA. — The Superintendent of the Botanical Department, Hong Kong, says:—"China is unquestionably a rich field for botanical research, and it is to be regretted that the Chinese authorities have no organised means, in the way of a national botanic garden, of cultivating and distributing their innumerable vegetable products. Botanic gardens of other countries would gratefully exchange the

valuable economic plants at their disposal for Chinese novelties, and the benefit would be mutual. We have not received one from a Chinese source this year. Hong Kong would be a convenient station for reciprocating favours from Chinese who might be disposed to introduce some of the resources of foreign horticulture, or agriculture, into China. We are gradually accumulating a large variety of plants of commercial value, a portion of which we would gladly distribute amongst any of our Chinese friends who might be inclined to favour us with some of the interesting vegetable novelties of the Celestial Empire."

— ARISTOLOCHIA TRILOBATA. — Having recently noticed this distinct species in two different gardens under the name of *A. Kämpferi*, the question might be excusable, how such a name could be applied? *A. Kämpferi* is a native of Japan, quite worthless for horticultural purposes, and does not seem to be introduced to this country in a living state. At all events it is not recorded in gardening dictionaries and other horticultural works. The species is described at length in DE CANDOLLE'S *Prodrromus*, xv., p. 439. The flowers are small, with a yellow tube and a purple-veined, shortly two-lipped lamina, without the long tail so characteristic of *A. trilobata*—a character, however, that is more liable to confound it with *A. macroura*, and such is actually the case in the *Botanical Register*, 1399, where the latter is figured as *A. trilobata*. The latter is a native of the West Indies and Brazil, and was originally introduced to this country in 1775. An excellent figure of the species is given in the *Botanical Magazine*, t. 6387, and a reference to the allied *A. macroura*, characterised by the upper segment of the perianth being produced into a long tail nearly 18 inches long. That of *A. trilobata* is more nearly about half that length, and pale brown, except at the base, which is much darker, while the rest of the perianth is pale green with anastomosing brown veins, saccate at the base, and produced into six short spur-like processes. Below the middle the tube is bent as if broken, and then suddenly ends in the slender broad-based tail as above described. The flowers are not so showy as those of some other species, but produced in great profusion, setting off the three-lobed leaves to advantage. The leaves of *A. Kämpferi* are exceptionally three-lobed, and excessively variable. The subject of this note may be seen in the Victoria and Palm houses at Kew, where they flower great part of the summer.

— ZAMIA INTEGRIFOLIA. — Prof. SARGENT writes, that in Florida this Cycad is largely cultivated for the sake of the starch contained in its roots, large quantities of the starch being made for the Key West and West Indian markets. There are several establishments now engaged in this industry upon the shores of Bay Biscayne and upon Miami River just below where it flows out from the Florida Everglades. All the species of the Cycad order are rich in starch, and some of them are common articles of food in the countries where they grow. In Japan sago is procured from the stem of *Cycas revoluta*, and we are told by THUNBERG that this sago is held in the highest esteem, it being contrary to the laws of Japan to take the tree out of the country. *C. pectinata*, *C. circinalis* and other *Cycases* also yield starch in more or less abundance. *Zamia pumila*, a West Indian species, is known to contain much starch in its stems and roots, but it appears that *Z. integrifolia*, also a native of the West Indies, is likely to prove the most important of all as a starch producer. The seeds of some of the Cycades also contain starch—*Dioon edule* deriving its name from the large seeds yielding considerable quantities of arrowroot. Plants of *Z. integrifolia* may be seen in the Palm-house at Kew.

— VEGETABLE PRODUCTS IN AUSTRO-HUNGARY. — A report from Austria-Hungary, dated from Serajevo in April last, states that by far the most important article of exportation from Bosnia is Plums. The dried fruit is either sent in barrels to Trieste and thence almost exclusively to America, or else in sacks of fifty kilos to Austria-Hungary and Germany. In good seasons the exportation reaches 49,210 tons. Last year it probably exceeded that amount, as the crop was the best that has been known for the last ten years. The annual exportation of valonia—the acorn cups of *Quercus Aegilops*—is, it seems, about 984 tons. Formerly it was nearly double that amount, but the quality is so inferior that it is little sought

after in Europe, and does not realise more than 16s. 8d. to 20s. per 100 kilos. No great sales of timber seem to have been effected during the past year. The local government board wished that the cadastral survey of the country should be finished, and the ownership of the forests correctly proved before any more timber was offered for sale. More than half Bosnia, and nearly a third of the Herzegovina is forest. The superficial area of these provinces is said to be about 21,000 square miles, of which 9657 square miles are forest, 6950 square miles arable land, and the remaining 4393 barren rock. The forests consist chiefly of Fir, Pine, Oak, and Beech trees. Although during a long series of years these forests were wantonly devastated by fire and reckless cutting, there is no doubt that they will be eventually a source of considerable revenue to the Government. The construction of a line of railway to the sea-coast would enable Bosnia to compete most advantageously with Italy and Austria-Hungary in the Levant timber trade, and in the exportation of charcoal.

— THE SPARROW.—This terrible nuisance to the fruit-raiser and seed-grower is, says the *American Gardener's Monthly*, like SATAN, not without an occasional good quality. Prof. WARD thus tells of a slight advance in its moral character:—"One small piece of good work the sparrow did last summer, and that was to practically exterminate the "seventeen year" locusts which appeared in the parks in the city of Washington. The London sparrows are reputed to read the newspapers, and this ability has probably been inherited by their descendants. Certain it is that immediately after the published declaration of Prof. RILEY that Cicadas were edible the best energies of the sparrows were devoted to their destruction. Forsaking the streets, they hung about the parks from morning to night, snapping up the luckless Cicadas as fast as they appeared. So great was the destruction that the edges of the walks were bright with a sparkling border of Cicada wings, and scarcely an insect was left to propagate the race."

— HEMIPHILIA CALOPHYLLA.—This one out of the two known species has just flowered for the first time at Kew, and may be described as a gem in miniature. It was discovered by the Rev. C. PARRISH on limestone rocks near Moulmein in 1873, and is described by REICHENBACH in TRIMEN'S *Journal of Botany*, 1874, p. 197. It is a terrestrial *Ochid*, and a near ally to our *Habenarias* with a solitary leaf, almost as attractive as an *Anacochilus*. It is caudate-oblong in a young state of the plant, but as the latter attains its full size the leaf becomes decidedly cordate, clasping the peduncle with its involute base, heavily and beautifully marbled with brownish-purple. The peduncle and bracts are also marbled in the same manner, the former attaining a length of 6 inches or thereby, bearing several flowers in a raceme. The sepals are white with a greenish midrib, the upper one being erect and protecting the column, while the lateral ones are broadly and obliquely ovate and spreading. The petals are ovate, smaller than the lateral sepals, but similarly coloured and erect. The labellum is obovate, emarginate, spreading, spurred at the base, deep rich purple, finely pubescent, as are the sepals and petals exteriorly, and by far the most conspicuous part of the flower. Varieties occur in a wild state, having the sepals and petals also brightly coloured. The grand and distinguishing feature of the genus, however, lies in the large and prominent rostellum, curved upwards and backwards, grooved in front and also in two places behind. It is finely pubescent, and of a deep maroon-purple colour. If the plant proves moderately easy to cultivate it will be a great acquisition notwithstanding its comparative smallness.

— MOVEMENT OF TENDRILS.—Dr. P. FENHOLLOW contributes an important paper to the *American Journal of Science* (xxxi., 46, 100 and 175), on the movement of tendrils in *Cucurbita maxima* and *pepo*, incidentally dealing with other phenomena of growth in these plants. The results obtained are based upon observations covering a period of ten years, the original and principal facts having been obtained in 1875 by a series of experiments which involved almost continuous observation through night and day, for a period of one week. He fully discusses the relation which meteorological conditions bear to growth, and confirms previous observations concerning the stimulating influence of combined heat

and moisture, but the retarding effect of the former when acting alone. The daily periodicity in growth, dependent upon alternation of day and night, is shown to be quite marked, the influence of conditions during the day being found to be greater in promoting the general growth than the retarding influence of sunlight, so that the general extension of parts during the day exceeds that for the same number of hours of night as 44.4 to 34.3, a ratio which confirms that previously obtained by RAUWENHOFF. The most important facts, however, are those relating to the mechanism of movement. This is found to depend primarily upon the presence of three active bands of cellular tissue, which traverse the tendril throughout its entire length, and by their more rapid rate of growth produce, through unequal tension of the various tissues, all the phenomena of torsion and circumnutation usually noticed. These bands, which the author calls *Vibrogen*, in allusion to their peculiar relation to movement, are found, one on the upper side of the tendril arm, and one on each side, somewhat above the horizon of the major and transverse axis of the section. Their direct connection with the circumnutation is most ingeniously obtained from the figures described by the circumnating tip of the tendril. Each figure is shown to exhibit changes of direction in movement, which are exactly reversed or follow an intermediate course, accordingly as any one band is directly succeeded by greater activity of its opposite or the remaining two bands; the direction thus taken being the direct expression of more vigorous growth in one band, or representing the resultant of activity in two bands at the same time. He next shows that the total latitudes of movement are one-half the total departures, thus bringing out in a more conclusive manner the precise relation of *vibrogen* to motion. The final conclusions, with reference to the cause of motion, are as follows:—1. Movements of the tendril and petiole are due to unequal growth, as producing unequal tension of tissues. 2. The unequal growth is chiefly defined in the *vibrogen* tissue, which may therefore be regarded as the seat of movement. 3. The band of unequal growth does not arise at successive points of the circumference. 4. The *vibrogen* tissue consists of three longitudinal bands, each of which becomes more active in turn, without regular order. 5. The collenchyma tissue is that which is chiefly concerned in variations of tension under mechanical stimuli. 6. Bending or coiling under the influence of irritation results from release of tension, or (free coiling) from inequality of tension through maturity of tissues. 7. Transmission of impulses is effected through continuity of protoplasm in the active tissues.

— MICHIGAN HORTICULTURAL SOCIETY.—The fifteenth annual report now before us forms a substantial volume of over 500 pages. Its contents fully illustrate what is being done in most States of the Union and in the Dominion of Canada, and they offer for our use on this side of the Atlantic an excellent model. Here if a society gets up one or two shows in the course of the year it is thought to have accomplished its purpose. It has perhaps contributed successfully to the enjoyment of a large number of people, especially if, as is common in the provinces, the horticultural display be associated with fireworks, bicycle races, and other accompaniments more fitted for a country fair than for a society which is supposed to have more important aims in view. We have nothing whatever to urge against the recreation of the people—quite the contrary; we only allege that it is not the proper function of a horticultural society to provide it. A horticultural society exists for the advancement of horticulture, and it goes out of its way when it attempts to fulfil any other office. In the United States, though, we doubt not, the recreative element is not neglected, the horticultural societies mean business, and do not mix work and play, but work first and play afterwards. In the case before us we see the Michigan State Horticultural Society has four meetings yearly, and that it has associated with it numerous local societies which seem all to work on the same general lines. The first pages of this volume give a summary of what is done in almost every State of the Union in the way of legislation for the promotion of horticulture, pomology, and forestry, with reports as to what laws have been found futile, and which successful. It may readily be conceived what advantage must result from such a summary. At the meetings the members do not confine themselves to mere exhibitions, but

they contribute papers on practical points, and by free discussion they elicit the opinion of those most competent to give it. Here are the subjects discussed at one of the meetings:—Insects, and the way to circumvent them; Fruit culture, Potato culture, Timber protection, Plum improvement, &c. These subjects are well and usefully handled, and the talk is not confined to a few chosen speakers, but is taken part in by the Fellows generally. A large part of the *Proceedings* of the American Pomological Society is represented, and at the end such portions of the classified *Fruit Catalogue* of the last-named Society as are applicable to Michigan.

RILEY, Ph.D. (Washington: Government Printing Office).—*Descriptions of Entomological Plantarum Novarum et minus cognitarum fasciculus X.* By E. KUGEL (Petropoli).—*Report of the Natal Botanic Society for the Year 1885* (Durban: Natal Mercury Press).—*Illustrations of the Indigenous Fodder Grasses of the Plains of North-western India* (Koorkee: Thomason Civil Engineering College Press).

INDIAN NOTES.

BOTANY AND HORTICULTURE IN INDIA.—The science of botany is a most interesting study, but requires years of close application to acquire anything like a competent knowledge. Horticulture, on the other hand, is but a pleasant recreation to those who love the garden and wish to know how to grow flowers. We therefore note with pleasure that the Madras Government has decided to substitute horticulture for botany in the higher examinations in science and art. For the preliminary examination a "Syllabus" has been compiled comprising the structure and growth of plants, soils, manures, tillage operations, horticultural operations, and horticultural implements. In addition to pass papers there will be a *viva voce* examination in the above subjects. This new departure will be an incentive to the study of a science which has hitherto in this country been confined to the few who have the time and means to pursue it. Efforts ought, at no distant date, to be made for the granting of a degree to candidates who take the highest honours. At present an Indian horticulturist has no *locus standi*, whereas his English contemporary, by having the letters F.L.S. (Fellow of the Linnean Society), or F.R.H.S. (Fellow of the Royal Horticultural Society), affixed to his name, carries the "hall mark" of efficiency in his profession [?]. Again, whenever the Government of India requires a curator or gardener for any of the Government botanical gardens or plantations a man has to be got out from England, at great expense, and under a covenant of three to five years. By establishing a degree in horticulture in India this expense and inconvenience will be done away with. No Englishman coming out here straight from home can be expected to know the language of this country, or the conditions of plant life in India. Another advantage of the system will be the encouragement to the study of a science that has long been neglected in India, and the supply of thoroughly trained gardeners; and it is a matter of surprise that a step in this direction was not taken long since. *Indian Agriculturist*, June 26.

THE AMILTAS.

This truly fine tree is the *Cassia fistula* of botanists, at one time called *Cathartocarpus*. It begins to flower in May, before the leaves appear; when about half done flowering the leaves begin to come out. There are two varieties—one with bright green leaves throughout, and one with fine maroon-bronze leaves, when young; these later on become green. The latter variety has usually bright canary-yellow flowers, which, intermixed with the newly-formed dark bronze foliage, have a truly grand effect. The green-leaved variety has usually flowers of a paler yellow.

The Amiltas, under favourable circumstances, grows into a large tree, and is fine under all conditions, with a round outline and drooping leaves. When in full bloom, however, it is one of the sights of the Indian flora. I have seen trees commence to flower when three years old, and though maltreated when young, still putting forth new foliage every year after winter's rest. It is not easy to kill it. The

pinnate leaves are 15 inches or more in length, with five or more pairs of leaflets, the smallest pair being at the base. The terminal pair is often 7 inches long, and $3\frac{1}{2}$ inches broad. The upper surface of the leaflets is dark green, and prettily veined; the lower surface is of a pistachio-green. The inflorescence is a loose drooping raceme, 1 foot or more in length. The flowers begin to open at the base, three-quarters of the raceme, however, is open at one time. The peduncles are $1\frac{1}{2}$ inch long, and the calyx of a greenish-yellow. The corolla, like most of the Cassias, consists of five loose petals. The pistil is wine-like, $1\frac{1}{2}$ inch long, and is curved downwards and forwards, like a sickle. The stamens are very curious; three are of the length of the pistil, and follow its curvature. They are of a pale yellow, with buff anthers; four are short and project forwards, with large yellow anthers; two are still shorter, and are curved backwards towards their insertion, and the tenth or vexillar stamen is the shortest. The latter three have very small or abortive anthers. It is not improbable that the three long stamens may have a different office from the short ones. All the stamens are soon shed, leaving the corolla and the hook-like pistil. The latter, if fertilised, becomes afterwards a straight green cylindrical drooping pod, $1\frac{1}{2}$ to 2 feet long. Eventually it turns black and hard when ripening. In winter the tree displays nothing but these pendent straight black and round sticks. The interior of the pod is divided by septa, between which are pretty heart-shaped, very shiny, rose-tan seeds. The septa consist of a brown sweet and sticky pulp, which, under the name of Cassia pulp, finds a place among cathartics, both in the British and Indian Pharmacopœias. This pulp gripes awfully unless protected by carminatives and sedatives. I have seen a native writhe and groan on the ground after taking an Amittas cathartic prescribed by a *hakim*. The size to which this tree grows, with its fine round head of dense drooping foliage, mark it out as a tree well suited to avenues, but probably this is the reason why it is not used for this purpose! An avenue of Amittas in bloom would be worth a trip from any part of the world to see. Avenues in India are usually made in a hurry-scurry sort of way. The Collector probably orders the *tehtidar* to look sharp and have this road all planted by the time the Commissioner makes his tour in the winter. The *tehtildars* forthwith collect "Neem," "Tissoo," Mango, "Peppul," Banyan, and anything else he can lay hands on, and plants the new avenue. When these grow they look like a battalion of Sepoys in some native states—some with slippers, others with top-boots; some with a red, others with a green turban; some with muskets, others with matchlocks—in short, all the quaint figurings of a carnival.

A few years of nursing appropriate trees for avenues, especially in situations, might make them worthy of the *Arabian Nights*. I wonder whether this tree is grown anywhere under glass in England. It is worthy of a glass dome to itself. When in bloom it would be a rare sight. The world is scourged for some rare insignificant Orchid, and special houses are made for these quaint plants, and here is a tree grown from seed with the greatest ease, and which, when in flower, no Orchid could approach for splendour and profusion of bloom, and is thought toothing of. When in full flower it is a perfect cascade of canary-yellow spray. Opposite my gate is an Amittas, which flowers in the beginning of July—two months after the others. E. Bonavia, M.D., *Etawah*, May 7.

HOW HONEY CELLS ARE FILLED.—Dr. C. Spencer, writing to the *Indiana Farmer* as to how a honey cell is filled, says:—"In my observatory one hive was built against the glass, and that afforded an excellent opportunity of seeing how bees deposit honey in the cell. First a bee deposited a thin coating of honey upon the base of the cell, making a sort of varnish, as it were, to the base of the cell. The next bee that came with honey raised up the lower edge of this film of honey, and forced its honey beneath; the next did the same, and this film acted as a kind of diaphragm, keeping the honey in the cell. When the cell is full enough to be sealed the bees commence contracting the opening with wax until they have only a small hole left in the centre, when they appear to take one little lobe of wax and put it down over the opening. At any time during the process of filling the cell the honey could be withdrawn with a hypodermic syringe, and the 'diaphragm' left hanging in the cell."

TAXODIUM DISTICHUM.

AN enquiry in the course of the spring for male catkins of this elegant and remarkable tree, brought us not exactly what was asked for, but some growths which are so peculiar that it is worth putting them on record. The normal shoot with the bud scales at the base, and with the growths in question, are shown at the top of the illustration (fig. 28.) of the natural size. In the centre are shown similar growths, normal and otherwise, magnified. On closer examination it seemed as if the ordinary bud scales at the base of the shoot had become thickened, and indeed in some cases there was an indication of the presence of seeds at the base of some of these scales as seen in the lower right hand corner of the illustration, or more probably of the scale upon which the seeds are borne. In some cases the growth of the shoot is arrested and then the production comes to look like

FIG. 28.—TAXODIUM DISTICHUM.

an Artichoke in miniature, while in others the shoot is prolonged as shown in the centre of the illustration to the left hand, and as happens in proliferous cones.

TRENTHAM GREENHOUSE BOILER.

The accompanying cut (fig. 29, p. 149) illustrates Silvester's patent Trentham greenhouse boiler. It would appear that this boiler is very different from, and an improvement on, the older form; there can be no doubt but the new features are distinct, and must increase the economy and efficiency of this class of boiler. The patentees, Messrs. F. Silvester & Co., Newcastle, Staffordshire, were the makers of the original Trentham boiler, and from experience have ascertained the weak points and shortcomings of the original Trentham boiler, the general opinion of which was that it was one of the best and most reliable boilers then existing for heating large quantities of piping; but opinions differed as to it being economical in the consumption of fuel; it

was also considered to be somewhat sluggish in its work. The patentees claim that these doubtful points in the old boiler have been overcome in the new one. A feature is in the mud or sediment collecting trough with removable door in the bottom part of boiler, which is easily accessible for cleaning out; the door can be taken out in a short time, and a good-sized scraper inserted, so that the lower half of the boiler can be well cleaned; this materially adds to the durability and efficiency of the boiler, for in cases of bad water the sediment would quickly fill the space between the shells.

Then let us look at the most important part—the circulating water-way bridge, the value of which is very great; in the old style of boiler the bridge at the end of the fire-bars was often made of a cast-iron plate and fire-bricks; these bricks in firing were frequently pushed away and fell down at the back, and consequently stopped up the flue, causing great waste of fuel, disappointment, and expense, the bridge having frequently to be renewed. In the new boiler the bridge is stated to be made of a special metal, and is connected with the water space in the bottom and also at the top part of the boiler; the flame or heat is made to pass through and over the bridge, and is thereby brought in full contact with the plates of the boiler, and a much greater amount of heat is obtained from the fuel used. The flame, having passed through and also over the bridge, comes in contact with an inclined disc or deflector, which spreads the flame and heat immediately it has done its work at the bridge. It is here collected and distributed again on the boiler plates, where it is of the greatest value. Another advantage claimed for this inclined disc is, that in cases of gaseous or green coal being used, the gases must be ignited between the bridge and the deflector, and consequently the consumption of smoke is accomplished. The fire in the patent arrangement is kept quite alive at the back or bridge end, whereas in the old boiler it was always dead from the fact that no air could get through to support combustion. In the new boiler, however, the air is able to get through the back of the fire and through the lower holes in the bridge, and consequently the fire is kept alive. In addition to the foregoing advantages the bridge acts as a stay to the flue, which is the weakest part of the boiler, and the general circulation is made thoroughly good. It must be obvious that this patent Trentham boiler combines a number of important advantages compared with the old form of Trentham, and we are inclined to think it is one of the best greenhouse boilers of which we know. Mr. Wallis, of Keele Hall Gardens, we believe, reports favourably of it. The boilers are constructed of a superior sort of steel, and are made in various sizes to heat from 450 feet to 7000 feet of 4-inch piping.

PLANT PORTRAITS.

- ARISTOLOCHIA ELEGANS, *Garden*, June 19.
 CARAGUATA ANDRÉANA.—Bromeliaceæ. Leaves recurved, tripled, spineless; flowers yellow, spicate. New Granada. *Revue Horticole*, June 16.
 CATTLEYA LAWRENCEANA, *Revue de l'Horticulture Belge*, July, 1886; and *Lindenia*, t. 44.
 DAPHNE MEZERIUM.—White-flowered and double-flowered varieties. *Garden*, June 26.
 DENDROBIUM THYRSIFLORUM, *Lindenia*, t. 46.
 DRACENA MADAME LUCIEN LINDEN, *Illustration Horticole*, t. 597.—A beautiful variety with dark green leaves variously striped and blotched with carmine, some leaves being almost entirely carmine.
 FAGUS SILVATICA ATROPURPUREA TRICOLOR (?), *Revue de l'Horticulture Belge*, July 1.
 LILIUM PARVY, *Illustration Horticole*, t. 595.—Flowers funnel-shaped, about four inches long, with reflexed segments almost as long as the tube; yellow spotted with reddish-brown. South California.
 LILIUM SUPERBUM, *Garden*, July 3.
 ODONTOGLOSSUM RUCKERIANUM, *Lindenia*, t. 41.
 PANDANUS KERCHOVEI, *Illustration Horticole*, t. 600.—A species that is at present only known by its elegant foliage. The leaves are long, linear, channelled in the centre, and toothed at the margins. Admiralty Islands.
 SAGENIA MAMILLOSA, *Illustration Horticole*, t. 598.—A stove Fern. The younger barren fronds single, oblong, lanceolate; fertile fronds, pinnately-lobed, 2 feet long, the sori immersed in cavities on the under surface; upper surface with numerous dome-like prominences corresponding to the depressions on the lower surface. Molucca Islands.

HOME CORRESPONDENCE.

Rubbish Heaps and Lime.—Perhaps Mr. Webster, your excellent correspondent, will pardon me for calling his attention to what is probably a slip of the pen. In his paragraph on "Nursery Work" (p. 78) he recommends occasional turning of rubbish heaps as a means of increasing fermentation, and he adds, "to hasten and insure this the admixture of a small quantity of lime is to be highly recommended." It means that the lime is to destroy the germinating property of the Uredo I quite agree with him, but if the lime is to aid and assist fermentation I entirely disagree with the doctrine. Lime, as I understand its action, prevents rather than assists fermentation. Z.

Strawberry Growing at Mereworth Castle.—Any gardener who has seen the shelves of Strawberries in the forcing-houses at Mereworth Castle Gardens, Maidstone, during the months of April, May, and the first few weeks in June last, must have gone away with the impression that they were worth going a long way to see, and that Mr. Herbert Markham, Lord Falmouth's energetic and good all-round gardener, was to be complimented upon his success in producing such heavy crops of large, well-coloured, and

it is often found in the wild state in a cool and moist situation, and probably a similar one suits it best under cultivation. *W. H. Divers, Kilton Hall.*

Carpenientia californica (p. 115).—There can be no doubt of the perfect hardiness of this fine shrub. I have two good plants of it under a south wall, and watched them with much anxiety during the winter, but gave them no protection whatever. Not a leaf was the least injured, and I have since had plenty of flowers, which seem likely to ripen plenty of seed. Cuttings put in now strike readily. *Henry N. Ellacombe, Bilton Vicarage.*

—This new hardy shrub is now flowering for the first time in Ireland. The plants now flowering were planted out in an exposed situation, and withstood the severe frosts of last winter without any protection. We have others planted against a wall in a sheltered situation two years previously, and so far they have refused to give any bloom. It is a native of Sierra Nevada. *Rolger McClelland & Co., Newry, Ireland.* [It was first flowered by Miss Jekyll. See *Gardeners' Chronicle*, July 24, fig. 113, at pp. 113 and 115. Ed.]

Carnations and Picotees at Slough.—If the fine head of bloom now to be seen at the Royal Nursery, Slough, may be taken as an indication of the general quality of bloom this season, then a very

(Dodwell), Scarlet Keet (Dodwell), and Bailey Junior (Dodwell). Rose flakes: Lady Gardener (Ely), a good old flower; Lord Chelmsford (Ware), Miss Erskine Wenys (Dodwell), James Flowdy (Flowdy), Rob Roy (Gorton), Stapleford Hero, Mrs. Matthews (Dodwell), extra fine; Mrs. Tomes (Dodwell), Sybil (Holmes), John Keet (Whitehead), and William Newman. The fancy varieties, many of them of great beauty, are late in flowering and will be seen to great advantage shortly. Of Picotees there is a fine collection in bloom, as might be expected, as, like the Carnation it is a flower largely grown at Slough. Of red-edged varieties there are Blanche (Dodwell), good petal and substance, and medium edge; Princess of Wales (Fellowes), heavy edge; Dr. Epps, heavy edge; and William Summers (Simonite), very fine. Purple edged: Norfolk Beauty (Fellowes), heavy, very bright; Her Majesty (Addis), large and full flowers, light edge; Princess Dagmar, heavy; and Clara Person (Willmer), a light edge flower of great breadth and substance of petal. Rose edged: Daches (Fellowes), heavy edge, full and bold flowers, but apt to bar; Maud (Fellowes), new, fine petal, with very bright medium rose—very pretty, full, good substance; Orlando (Fellowes), new, heavy rose, large, full flowers, good petal, plenty of stuff, and a good grower; Evelyn (Fellowes), fine petal; Louisa (Addis), heavy rose, a flower which at times comes very good indeed; Miss Horner (Lord,

FIG. 29.—SILVESTER'S IMPROVED TRENTHAM BOILER. (SEE P. 148)

luscious fruits, the average weight of which was about twelve to the pound. Mr. Markham layers his runners as soon as they can be had into the fruiting-pots, using rich loam, which is rammed firmly into properly crocked pots for the purpose, and during the interval, from the time the layered plants have taken to the soil until they have completed their growth in September, they are kept liberally supplied with liquid manure at the roots, the same stimulating food being applied in the same direction from the time the plants have set their fruits until the latter begins to colour, when only clean water is given at the roots. Each plant is allowed to ripen from nine to fifteen fruits, and as ripe Strawberries are not required at Mereworth before April, Sir Charles Napier, Sir J. Paxton, and British Queen, are the varieties chiefly grown; the crops of Grapes, especially those on the pot-Vines, having berries as large as Walnuts. Peaches and Melons are also deserving of passing notice. *Vistor.*

Epilobium angustifolium.—Among the great number of good things to be seen at Chatsworth at the present time this is remarkable as a beautiful hardy flower, within the reach of every one, and probably growing wild in the neighbourhood of many places; but often in its wild state it is, comparatively speaking, insignificant. To see it in full beauty it should be cultivated in a position similar to that in which Mr. Thomas has it, viz., a shrubby border, where it can get well established in a good mass without being disturbed, and where there is no danger of its overgrowing any choice plants. I have noticed

fine exhibition of these favourite flowers may be confidently looked for at the several Carnation shows. There are about 2600 pots of Carnations and Picotees at Slough, and they are now arranged in various houses where they can be seen to the best advantage; the flowers, though young when seen, were rapidly developing into fine blooms; the "grass," as the foliage is termed, is healthy, free, and clean, and the variety great. Of Carnations the following can now be seen to great advantage:—Scarlet bizzars: Robert Lord (Dodwell), James McIntosh (Dodwell), Master Stanley (Dodwell), Lord Napier (Taylor), Charles Turner (Dodwell), and Arthur Meiburst (Dodwell). Crimson bizzars: Rifleman (Wood), Harrison Weir (Dodwell), Crimson Banner (Simonite), E. S. Dodwell (Hewitt), Mrs. Maclaren (Fitch), a variety that is classed among the Tree Carnations, but is just now putting forth some fine flowers; it also sports into several types of a fancy character, and so is full of interest; and Master Fred (Hewitt). Pink and purple bizzars: James Taylor (Gibbons), Twyford Perfection (Young), Sir Garret Wolsley (Hewitt), Old Sarah Payne (Wood), Squire Llewellyn (Dodwell), Falconbridge (May), an old but still good variety; Princess Beatrice (Bardsley), and Joe Jagstock (Dodwell). Purple flakes: Sporting Lass (Flowdy), Juno (Baldon), James Douglas (Simonite), Mayor of Nottingham (Taylor), Mrs. Suthern, a flower of fine substance and marking; and Florence Nightingale. Scarlet flakes: Royal Scarlet (Puxley), Figue (Abercromby), John Bayley, an old but still useful flower; Don Godfrey (Holmes), John Ball (Dodwell), Jupiter (Abercromby), Henry Cannell

a heavy rose, of excellent quality; and Favourite (Liddington), a lovely light flower of great refinement. As far as information has come to hand the promise of bloom is good all round, but late in the more northern localities. Lovers of the Carnation and Picotee in the southern districts should see their favourite flowers in great form at Oxford on the 31 proximo. *R. D.*

Phyteuma comosum.—The successful cultivation of this plant on rockeries is not very easy. I have proceeded as follows:—I obtained a plant four years ago from Messrs. Froebel. By the advice of Mr. Loder, I put it between two flat bits of limestone and added a mere sprinkling of peat soil. I then tied the stones together and hammered them into a crevice on the south face of a rockery where the roots could find no soil. In 1884, it produced four flowers; in 1885 only two or three leaves, and no flowers; and this year, about the end of June, six very fine flowers. In fact, it might have sat for the portrait which is given on p. Sr. C. *Wolley Dod, London, July 17.*

Flowering Shrubs from Ireland.—I send herewith flowering specimens of both kinds of *Desfontanea spinosa*, the one with incipient seed-pods being the ordinary one (which will not do well with me, though now in great beauty and abundant bloom at my next-door neighbour's garden, from whose plant this specimen comes), the other being the much less known *D. spinosa Hooker*, which is now in full and most abundant bloom with me; also two pretty

pink Spirææ. The smaller specimen, *S. bumalda*, with evil smell. I want to know if the other, with smaller flowers, is correctly named *S. callosa*, *W. E. Gambleton*. [Ves. Ed.]

Stephanotis Fruit.—I enclose herein the companion fruit to the one figured in the *Gardener's Chronicle* at p. 817, Dec. 26, 1885. It is now ripe, and has taken over twelve months to develop. You will observe that some of the seeds have germinated within the fruit. Is not this a remarkable circumstance? This specimen came from Messrs. Lucombe, Pince & Co.'s nursery, *W. Napper, Alington Court*.

Campanula Raineri.—There is quite a display of this rare Eastern species of Harebell to be seen in the York collection. The plants are growing in large 60-pots, and are well covered by their large, bluish-purple flowers; the blossoms are borne solitary, on stalks only, from 1 to 2 inches high, while the flowers are about as large as those of *C. tubinata*. It is a subject worthy to be associated with the most choice of rock plants. Y.

Siam Ginger.—Amongst the collection of fruits, &c., shown by the Siam Commission at the International Health Exhibition, held at South Kensington in 1884, were some roots labelled "Ginger." These were obtained for the Kew Museum, but one of them being alive was planted to grow, and it is now bearing stems 5 feet high, and is in flower. On comparing it with the drawings and specimens in the herbarium, Mr. Baker has identified it with a specimen labelled "Alpinia sp., Bangkok," which was collected by Sir K. Schomburgk in 1864, and which is very near to *A. albuges*, also a native of Siam, where, according to Schomburgk, it is cultivated for its Cardamom-like fruits, and is known as *Luh-ken*, or *Bastard Cardamom*. Under the name of *Galangal*, *A. officinarum*, a Chinese species, is cultivated for the sake of its aromatic rhizomes, and this unnamed species now in flower at Kew is apparently largely cultivated by the Siamese as a substitute for Ginger. The rhizome is very thick, slightly flattened, and not so freely branched as in common Ginger; it has the pungent aromatic properties of Ginger, so far at least as could be told by tasting it. There is some reason for believing that the Chinese Ginger of commerce is not obtained from *Zingiber officinale*, the source of Jamaica Ginger, but from a species of *Alpinia*, and possibly this unnamed one at Kew. Plants of true Chinese Ginger are now growing at Kew, and these may soon flower; at present they have the same habit, broad leaf and rhizome, of the Siam plant. In *Zingiber officinale* the inflorescence is borne on a separate short stem without leaves, the barren stems being about 3 feet high, and clothed with narrow spear-shaped foliage; in *Alpinia* the flowers are borne in panicles on the ends of the stout leaf-stems, the well-known *A. natans* and the newer *A. nutica*, both beautiful garden plants, being familiar examples. *W. Watson, Kew*.

Ripe Mistletoe Berries in July.—Your correspondent from Southampton seems to think we in the north of Scotland are lacking in the powers of discernment, but I may repeat of inform him that in regard to the above subject such was not the case. Mr. Webster, the worthy and respected gardener at Gordon Castle, was perfectly aware of the fact that the berries were the produce of last year, but that did not hinder him from thinking that the circumstance was so unusual in our northern climate as to allow a gentleman who called upon him to send a spray to the *Gardener's Chronicle*. If I might be allowed to direct the attention of your correspondent to a meeting of the Royal Horticultural Society, held on July 13—a notice of which appeared in your issue of the 17th—a ripe Mistletoe berries were considered so unusual even in the South as to bring forward a spray of it by Dr. Masters for exhibition. *J. L., Glen Grant*.

Flowering of Arundinaria.—Mention has been made in your columns of the simultaneous flowering of *Arundinaria gracilis*, in the south of France and at Paris; but there is, I think, a circumstance which merits particular notice, and of the special consequences which appear to result from it. *Arundinaria gracilis* is said to have flowered simultaneously at Hyères, Paris, Brest and Cherbourg. At Paris, in the Museum d'Histoire Naturelle, the flowering is recorded in three situations:—1st, in a cold house (*pacillon caré*); 2d, in the Botanic Garden, (herbaceous ground); 3d, in a special enclosure called the *caré* Brongniart. In the third case the plant (which is left entirely to itself without any sort of cultivation, and without any shelter, in the midst of, and in spite of the grass and weeds which encroach on it). The leaves are ill-developed from the unfavourable circumstances. On the flowering growths there is a tendency to become variegated. The fact to which I wish to draw attention is this—the flowering has taken place

in plants of very different degrees of vigour, foliage, and stature. In the conservatory the *Arundinaria* is 5 to 6 metres in height, and even more. In the open air it is 2 metres. At the Garden of Acclimatization of Paris the plants were of moderate height. What seems to have regulated its flowering is something more than the force and energy of vegetation. It seems that it is due chiefly to alternation of growth and rest. This alone has been common to all the plants under all conditions, the conditions very probably of the same age, from the same lot of seeds, or derived from the divisions of one original plant. A great deal has been said about the cause which has determined the rapid fruiting in the method called *proclit* *Touraine*, and which is due to a clever horticulturist in the environs of Pau (lower Pyrenees). This process consists of treating several times a year the young seedlings and the young plants from them. By this means the fruiting of Pears and Apples is secured in five or six years instead of fifteen or twenty. By this means the alternations of rest and activity are multiplied, and it is perhaps by the influence of this alternation that the adolescence and maturing of a tree is hastened. *Max Cornu, Paris*.

Reports of Societies.

ROYAL HORTICULTURAL SOCIETY,
and NATIONAL CARNATION,
and PICOTE SOCIETY: Tuesday, July 27.

This meeting in the conservatory at South Kensington was partly competitive in so far as concerned the Cynaraeans and Picotees, and the Cabbages, Pears, Beans, and Lettuces that were shown by numerous growers for the special prizes offered by several large seed firms. There was, therefore, enough to satisfy a variety of tastes, and the happy flowers of Messrs. Barr & Son and T. Ware, who still keep up a great bank of cut blooms on the north side of the building, contributed not a little in making a display of colour that was quite needed.

Scientific Committee.

Present: Dr. M. T. Masters in the chair; and Mr. Pascoe, Professor Boulger, Mr. Worthington G. Smith, Mr. Wilson, Mr. O'Brien, and Rev. G. Henslow, Hon. Sec.

SELENIPEDIUM, UROPEDIUM, and CYPRIPEDIUM

Observations were made upon these forms, that while the first and the last differ very slightly in morphological characters, having one and three-celled ovaries respectively, yet, as Mr. O'Brien observed, they refuse to cross, though *Selenipedium* cross readily, as do also *Cypripedium*, with one another. *Uropeidium* is a peloric variety of *Selenipedium*—showing a natural tendency to a reversion to a regular and more ancestral form.

CYPRIPEDIUM SUPERBIENS (VEITCH).

Dr. Masters exhibited from Mr. Henry James of Lower Norwood a specimen of this variety of *Veitchia*; another from the same plant had one within the ovary. In the former (being side by side) it was an additional petal to the ordinary number, the true median lip, however, being absent, but in the latter case the inner labellum represented an anterior stamen.

CATLYEA LODDIGESII.

Dr. Masters remarked on the specimen shown at the last meeting, which he had examined, and which proved to have two sepals, two petals, one stamen, and no pistil; hence it was a flower which had degenerated to a dimorphic condition.

LILIUM LANCI-FOLIUM SPECIOSUM.

Mr. O'Brien exhibited a plant which had been grown solely in moss for two years, with only a slight quantity of Clay's fertiliser added when the bulbs began to sprout. He remarked on the importance of potting fresh imported bulbs in some porous material, such as cocoa-turf fibres, &c., and of avoiding burying them in the ground, in order that there might be a free circulation of air about the bulb. The common practice of planting in the ground often caused the bulbs to disappear entirely. The interpretation of the advice seemed to be the same as for seeds—that if planted too deeply, or so that air could not reach them to set up respiration, they would perish from asphyxia and rot.

GRAPEs WITH OIDIUM TUCKERII.

Mr. Plowright forwarded specimens attacked by this fungus, now known to be *Erysiphe communis*, on the stalks, the Grapes themselves having some peculiar dendritic spots of a dark colour. There did not appear to be any mycelium. The dark lines, less than a quarter of an inch, are formed by reddish-

brown discolorations of the epidermal tissue. They were generally considered by the committee not to be fungoid, but only natural changes of the character of the epidermis on ripening.

NEMATOID WORMS IN CEREALS.

Mr. Worthington G. Smith exhibited specimens of cereals from Midlothian, the roots of which were attacked by *Heterodera radicola*. It was called Tulip root, Thick-root, and Segging in Oats, in Scotland; and appeared to be widely spread, all crops being totally destroyed on damp clay soils for several years. On stony soils the crops were not so severely attacked.

LARIX GRIFITHII WITH CONES.

Dr. M. T. Masters exhibited a branch bearing several cones. They were from 3 to 4 inches long, of a rich purple colour, while the pointed bracts behind each scale were of a golden-brown. It was received from Mr. Nansen, Gen. to Mr. Trelawney C. Linnick, Cornwall. It was believed to be the first instance of this Himalayan species of Larch to have borne cones in this country. He observed that the leaves were readily distinguished from those of the *Larix europæa* by having stomata on the lower side only, while those of the common Larch are on both sides.

CLEMATIS "PROTEUS," DOUBLE AND SINGLE.

Mr. Noble sent an illustration of this Clematis, which is remarkable for always bearing double flowers at the first flowering season, but later in the autumn only single flowers. It illustrated conditions of a temporary exhaustion in the plant, which is characteristic of this variety, but not of other forms of Clematis.

CLEMATIS VITICELLA RUBRA GRANDIFLORA SUB-VIKESSES (L).

Mr. Noble also forwarded sprays of this plant with semi-foliosaceous sepals, they being usually of a deep crimson; the green foliosaceous character commenced at the apex of the sepal and more or less descended to the base.

ACHILLEA MILLEFOLIUM, DIMORPHISM IN.

Rev. G. Henslow called attention to the hitherto unobserved fact of this plant being gynodioecious. The heads are very distinct when in blossom, as in the hermaphrodite flowers the yellow anthers when shedding their pollen protrude from the corolla, though they become withdrawn later on through the contraction of the filaments. This form has been carefully described by H. Müller (*Fert. of Flowers*, pp. 325 & 6), but he does not appear to have noticed its female form. In the first stage of blossoming of this kind the long style arms of the ray florets are very conspicuous, but later, when they shrivel, those of the disc florets rise up, but are of the same form as in the corresponding florets of the hermaphrodite flowers, being provided with the terminal bristles, the papillæ of which, however, seem to be less prominent. The anthers of the female are abortive and contain no pollen, and are often scarcely coherent. Another feature is the frequent reduction of petals and stamens in number to fours and threes in the female flowers; and, lastly, there is a slight difference in the length of the ovaries, that of the female being a trifle longer than the tube of the corresponding a little shorter than in the hermaphrodite flowers.

STRAWBERRY WITH FOLIACEOUS EPICALYX.

Mr. Henslow exhibited a specimen in which each of the divisions of the epicalyx consisted of a three-lobed leaflet. They are ordinary bract-like, or sometimes cleft at the apex, which has given rise to the theory that they represent pairs of coherent stipules. The present example would seem to point to their being a whorl of three leaves in their primitive condition, and before separation into three leaflets to form the usual compound leaf.

Floral Committee.

Present: G. F. Wilson, Esq., in the chair; and Messrs. J. Hudson, J. Downy, H. M. Pollett, A. F. Leadbey, J. O'Brien, E. Hill, C. Noble, W. Holmes, H. Herbst, W. Bealby, W. Wilks, Amos Perry, J. Burnett, T. Baines, H. Cannell, W. B. Kellock, G. Duffield, J. Walker, H. Ballantine, H. Turner, Shirley Hubbert, M. T. Masters, and R. Dean.

Several new plants appeared from the Veitchian establishment at Chelsea, in Rhododendron bulbiferum (Rajah), which, it was stated, was raised from the same pod of seed that had given double-flowered varieties of yellow, white, and pink colours. In this rich-coloured orange and yellow flower the inner row of petals are very much inferior in size to the outer ones, and the whole flower is very unlike in form any other of the greenhouse section, being widely expanded and the tube shortened. *Todæa grandipinnula*, a Fern raised at Chelsea spontaneously—at least, its origin is not ascertained, but is supposed to be a *T. Fraseri* and *T. hymenophylloides*; see *Gardener's Chronicle*, June 4, this year, p. 752, where it is fully described by Mr. T.

Moore. The plant as seen is very pretty, and quite bears out the published description. A *Caladium* named *Chateaugame* came also from Chelsea; it had reddish foliage.

Mr. Jannoch, Lily Nursery, Dersingham, Norfolk, showed *Adiantum* and *Epilobium* (Moore), described in the *Gardener's Chronicle* for July 1st last. It is a handsome addition to the genus, as of larger growth, and more graceful in habit than *A. capillare*, and capable of cultivation in a cool-house, as that is.

R. H. Measures, Esq., Cambridge Lodge, Camberwell, showed *Oncidium stelligerum* Ernesti, a pretty variety, bearing eight flowers on a spike, the sepals and petals of primrose-yellow, blotched with brown, the lip dull pink in the lower part, and pure white in the upper half; the flower would measure about 2½ inches in width.

W. Lee, Esq., Downside, Leatherhead (gr. Mr. C. Woolford), showed several finer flower-colours of *Leuella elegans* Turner, showing rather rich biazire tints, the lip being of a deep shade of purple that goes some distance into the throat; the sepals and petals are dull purple. There were nine flowers on a spike.

C. G. Hill, Esq., Arnot Hill, Notts (gr. Mr. Davenport), showed *Cattleya gigas* var. with a beautiful lip of purple, throat suffused and stained with gold normally, and convoluted petals and sepals measuring 7 inches across. *Cattleya gigas*, Hill's var., was considered worthy of being distinguished by a Certificate. The sepals and petals are purplish-rose, with faint mottlings of white, the lip much frilled, and divided in the centre into lobes, the colour being of a rich shade of purple; yellow stamens descend to the bottom of the throat. It is a handsome variety.

Baron Schroeder, The Dell, Egham (gr. Mr. Billantine), showed a beautiful spike of *Cypripedium Morgan* bearing three fully open flowers and buds. Mr. Robert Wood, Bury Green, Bury, Hill, Maidenhead, showed a quantity of single and double flowered tuberous *Begonia* blooms, likewise several new varieties of *Begonia*, viz. *M. archonensis* of Lorne, a variegated single bloom; *Queen of England*, a full double salmon coloured bloom; *White Alba*, plain, creamy-white; and *Colindale*, double rose.

Mr. H. B. May, nurseries, Dyson's Lane, Epsom, had *Pteris cretica* var. *H. B. May*, previously described in *Gardener's Chronicle* for May 1st last.

Mr. W. B. Bay, nurseries, showed a yellow flowered tuberous *Begonia* named *Louis D'Or*.

Mr. J. Douglas showed a self Carnation, *Terra Cotta*, of an orange-pink colour, with small slaty flaking.

Mr. R. Dean showed an Intermediate Stock with robust habit and white flowers, and Ten-week Stock *Matine Beauty*.

From MM. E. H. Krelage & Son, Harlem, came some seedling forms of the new race of hardy *Gladoli*. Some of the colours were new in these flowers, but the spikes of bloom were in all instances very short.

Mr. C. E. Roy, of the Old Nurseries, Cheshunt, furnished a nice assortment of Hollyhocks in good condition, spikes of a good length, and the flowers mostly of good quality.

Mr. C. Noble, nurseries, Bighsh, showed a few new hybrids of *Clematis* in *C. tangutica* violacea, a single flower, deep violet. *The President*, also single bluish-purple; *Mrs. Chomondley*, single blue, and very large.

Messrs. W. Paul & Son, Waltham Cross, exhibited twelve boxes and as many baskets of cut roses, consisting of H.P., Teas, and Polyanthus varieties.

Messrs. Paul & Son, the Old Nurseries, Cheshunt, staged a gaudy array of hardy flowers, mostly in the cut state, such as *Lilies*, *Geums*, in varieties; many fine *Phloxes*, *Erigeron speciosa* *superba*, *Eranurus* *Oligæ*, of pale pink colour, with a yellow centre; and *Statice speciosa*, a plant with long narrow leaves and covered in white with many part with white-blossom.

Mr. T. Ware, Tottenham, had a long bank of hardy flowers, amongst which some specimens of *Lilium auratum* *platyptalum* *album* surrounded with splendid crowns of white flowers, yellow stained towards the bottom of the throat. Details of the single-flowered and bouquet varieties have begun to put in an appearance and several were noticed in this collection. *Matricaria inodora grandiflora*, with flowers almost twice the size of these of the original species, and regularly formed, was a striking plant of some merit, as was *Liracanthemum maximum* *pumilum* and *Coreopsis lanceolata*, both improved forms of common border species.

Messrs. Barr & Son's collection of hardy cut bloom was also of considerable extent, and was much brightened by the appearance of many novel and valuable groups of *Gladoli* of various branches, *Lilies*, and annuals of several species.

FIRST-CLASS CERTIFICATEES.

To Messrs. J. Veitch & Sons, for *Rhododendron Rajah*, and for *Todea grandipinnula*.

To Mr. C. G. Hinde, for *Cattleya gigas*, Hill's var.

prizes were awarded—1st, Mr. R. Timbs, Hammersley Lane, Tyler's Green, Amersham, for some monstrous pods, fully grown, and, as we thought, too old to be good eating; 2d, Mr. T. A. Becket, Cole Hatch Farm, Penn; 3d, Mr. Waite, gr.; Glenhurst, Escher—all notable examples.

For the best two heads of Carter's Giant White, Carter's Longstard, and All the Year Round,—1st, Mr. T. A. Becket; 2d, Mr. Waite; 3d, Mr. L. Hurns, Broadham, High Wycombe. These were very nice crisp-looking heads, cut at the right time.

For the best three specimens of Carter's Heartwell Early Marrow Cabbage,—1st, Mr. Osman, South Metropolitan District School, Sutton, with a very good example of this productive early kind; 2d, Mr. T. A. Becket; 3d, Mr. Jacob, Pond Street, Pitworth.

MESSRS. SUTTON & SONS' PRIZES.

For the three best heads of Sutton's First Crop Cauliflower,—1st, Mr. T. A. Becket, with capital medium-sized firm heads; 2d, Mr. Waite; 3d, Mr. Osman.

For the best collection of six dishes of Peas, to include Sutton's New Marrow, Satisfaction, and the Duke of Albion,—1st, Mr. Marriott, Surlbeck, Easton, who had besides the two of the above kinds Laxton's Charming, Telephone, Telegraph, and Evolution; 2d, Mr. H. Marriott, Boston, Satisfaction in this lot being very fine; 3d, Mr. Walker, Clapham Park, Bedford; 4th, Mr. J. Cook, Boston Long Hedges, Boston.

For the best three specimens of Sutton's Little Gem, and Sutton's All Heart Cabbages,—1st, J. Downing, Esq., The Shrubbery, Enfield (gr. Mr. P. Cornish); 2d, Mr. G. Woodhouse, Model Farm, North Dulwich; 3d, Mr. Osman.

MESSRS. WEBB AND SONS' PRIZES.

For the best 24 pods of Webb's New Chancellor Pea,—1st, Mr. H. Marriott, Skirbeck; 2d, Mr. H. Marriott, Boston.

MISCELLANEOUS.

Messrs. T. F. Rivers & Sons, Sawbridge, showed 37 trees of *Nectarines*, *Peaches*, *Plums*, *Pears*, &c., which with fruit a lesson in amateur with small gardens, showing what can be obtained from such miniature trees in 14-inch pots. About a dozen dishes of splendid *Cherries* of sorts were likewise sent from Sawbridge.

Five varieties of Cabbages were exhibited by Mr. Barton, of the Southern Nurseries at Chiswick. St. John's Day being apparently the best-hearted.

The National Carnation and Picotee Society (Southern Section).

It is generally acknowledged that the exhibition of the National Carnation and Picotee Society was a good one; the flowers were numerous, large, well marked, and of the whole, and this general characteristic prevailed throughout the show. It was an exhibition confined almost entirely to Southern growers. A few of the Southern growers say they could have shown better a week ago, but on the whole the future is left to be seen, and consequently we feel we are justified in stating the average bloom was at its best.

CARNATIONS.

The leading class was for twenty-four blooms, not less than twelve distinct varieties (five prizes being offered), and here Mr. Charles Turner, Royal Nurseries, Slough, was placed 1st, with what we describe as a magnificent lot, large, smooth, well marked, and finely coloured. The varieties were—*Scarlet* *Brides*: Robert Lord, George, Arthur Medhurst, and Edward Adams. *Crimson* *bizire*: Riffeman and William Skirving. *Pink and purple bizire*: H. K. Mayor, James Taylor, E. S. Dodwell, and Mrs. Payne. *Scarlet flakes*: John Ball, Matador, and Henry Cunnell. *Purple flakes*: James Douglas and Sporting Luis. *Rose flakes*: Rob Roy (a magnificent bloom). *Mrs. Bridgewater*, and Mrs. Tones. 2d, Mr. J. Douglas, gr. to F. Whitbourn, Esq., Great Fitch, Woking, with what we judge inferior blooms, a very good lot indeed, consisting of S.B., Joseph Crossland, Fred and Theus (Douglas); C.B., Mr. Burrow; a sport from James Merryweather, Samuel Barlow (Dodwell), and Duke d'Anville (Douglas); P.F.B., Felicité (Douglas); Unexpected and Sarah Payne; P.F., James Douglas and Squire Whitbourn; (Douglas); S.F., Matador, Thalia (Douglas), Aliamond (Douglas); R.F., Constance (Douglas), Tim Bobbin and Diana; 3d, Mr. James Hines, 83, Bramford Road, Ipswich; 4th, Mr. Thos. Garratt, Bishops Stortford; 5th, Mr. J. Hooper, Vine Nursery, Bath. Five stands competed in this class.

In the class for twelve blooms five prizes were offered, and eight stands competed. Mr. J. Douglas gaining 1st prize with a fine even lot of blooms, consisting of S.B., P.F.B., Felicité and Arthur Medhurst, Duke d'Anville, a stout form; James Merryweather and Sarah Payne; P.F., James Douglas and Squire Whitbourn; S.F., Matador and Aliamond; R.F., Thalia and John Keet; 2d, Mr. John Hines, with S.B., Edward Adams; P.P.B., Rob Roy; C.B., Master Fred and Squire Dodwell; R.F., John Ball, James Taylor, P.F., Sporting Luis and James Douglas; S.F., Matador and John Ball; R.F., John Keet and Tim Bobbin. 3d, Mr. J. Lakin, Tipton Grove, Oxford. 4th, name of exhibitor not given. 5th, Mr. M. Kowan, 36, Manor Street, Clapham, S.W.

In the class for six blooms there were five prizes also, and twelve stands competed. Here Mr. C. Phillips, Hamilton Road, Earley, Reading, was 1st, with good blooms of S.B., Tom Power; C.B., John Harland; P.P.B., H. K. Mayor; P.F., George Melville; S.F., Robert

Morris; and R.F., Mrs. Gavin. 2d, Mr. T. E. Henwood, with flowers unnamed. 3d, Mr. Thomas Austiss, Brill. 4th, A. Spurling, Esq., The Nest, Blackheath, 5th, Mr. H. Startup, 3, Stanley Road, Bromley, Kent.

Then came classes for single specimen Carnations, five prizes being awarded in each of the following classes—S.B., 1st and 2d, Mr. C. Turner, with Robert Lord; 3d, Mr. J. Douglas, with Arthur Medhurst; 4th, Master Stanley; 5th, Mr. C. Phillips, with George C.B., 1st, Mr. J. Douglas, with Duke d'Anville; 2d, Mr. C. Turner, with Riffeman; 3d, Mr. J. Douglas, with sport from James Merryweather; 4th, Mr. J. Lakin, with Master Fred; and 5th, Mr. J. Austiss, with the same. P.P.B., 1st and 2d, Mr. C. Turner, with Sarah Payne; 3d, Mr. J. Douglas, with Unexpected; 4th, Mr. J. Lakin, with Squire Llewellyn; 5th, Mr. M. Kowan, with William Skirving. P.P.F., 1st, Mr. C. Turner, with Mayor of Nottingham; 2d, Mr. J. Lakin, with Squire Meynell; 3d, Mr. C. Phillips, with Sarah Payne; 4th, Mr. C. Turner, with Sporting Luis; 5th, Mr. J. Lakin, with Major Gene. S.F., 1st, Mr. J. Douglas, with Matador; 2d, Mr. C. Turner, with Henry Cunnell; 3d, Mr. C. Phillips, with Sportsman; 4th, Mr. C. Turner, with Figaro; 5th, Mr. J. Douglas, with seedling. R.F., 1st, Mr. C. Turner, with Rob Roy; and 2d, with the same; 3d, Mr. J. Lakin, with Tim Bobbin; 4th, Mr. J. Douglas, with Diana (Douglas); 5th, the same, with Thalia.

The Premier Carnation, selected from the whole exhibition was R.F. Rob Roy, shown by Mr. Turner in his stand of twenty-four varieties—a grand bloom.

PICOTEES.

Here also the leading class was for twenty-four blooms, not less than twelve distinct varieties, and five prizes. Turner and Mr. J. Douglas were named equal 1st, the former having large full flowers of fine quality, the latter smaller blooms, but characterized by great purity and refinement. Mr. Turner had, of heavy red edges; J. B. Light, red, Dr. Epps, of red veins, and J. Brantley, Light reds; Thomas Williams, Heavy purple; Muriel and Mrs. A. Chancellor. Light purple: Her Majesty, Julietta. Heavy rose edges: Duchess (Fellows), a fine new variety not yet distributed; Mrs. Payne, Louis, and Constance Heron. Light rose edges: Favourite (Liddell), Orlando, and James Douglas. Heavy red edges: heavy reds; J. B. Bryant, Princess of Wales, Brunette, and a seedling. Light reds: Thomas William, Clara, Dr. Horner, and Mrs. Gorton. Heavy purple edges: Mrs. Chancellor and Muriel. Light purple: Her Majesty, Alice, Clara Gorton, and Mrs. Gorton. Heavy roses: Heuresse (Douglas), Mrs. Payne, Constance Heron, and Seedling No. 13. Light red: Favourite. 2d, Mr. J. Hines; 3d, Mr. F. Hooper; 4th, Mr. Thomas Garratt. Five collections competed.

In the class for twelve varieties there were nine collections, and here Mr. J. Douglas was 1st, with heavy reds; Princess of Wales and John Smith. Light reds: Thomas William and Mrs. Gorton. Heavy purple: Muriel. Light purple: Alice, Her Majesty, and Clara Pension. Heavy roses: Seedling and Mrs. Payne. Heavy roses: Favourite roses; Mrs. Payne, John Lakin, with heavy red; John Smith. Light purple: Her Majesty, Jessie and Clara Pension. Heavy roses: Constance Heron, Royal Vist, Mrs. Payne, Edith d'Ombrain, and Mrs. Rudd. Light rose: Favourite, Ethel and Miss Horner. 3d, Mr. John Baxton, 27, Manor Street, Clapham. 4th, Mr. M. Kowan, 36, Mr. John Hines.

In the class for six varieties, there were thirteen collections and five prizes offered; the 1st prize going to Mr. T. Austiss, with flowers unnamed; 2d, Mr. T. E. Henwood, also unnamed; 3d, Mr. C. Phillips, G. C. Phillips; 5th, Mr. F. Glascock, Bishops Stortford.

Then followed classes for single specimens, five prizes being awarded in each as follows—Henry Reds; 1st and 2d, Mr. C. Turner, with Henry Matthews; 3d, Mr. J. Douglas, with Princess of Wales; 4th, Mr. T. E. Henwood, with Mrs. Dowdell; and 5th, Mr. J. Douglas with the same. Light reds: 1st and 2d, Mr. C. Turner, with Mrs. Gorton; 3d and 4th, Mr. J. Douglas, with Thomas William; 5th, Mr. C. Phillips, with Clara. Heavy purple: 1st and 2d, Mr. C. Turner, with Muriel; 3d, Mr. J. Douglas, with Mrs. Chancellor; 4th, Mr. J. Sanders, Bookham Lodge, Cobham, with Zerlina. Light purple: 1st and 2d, Mr. C. Turner, with Julietta; 3d, Mr. J. Douglas, with Her Majesty; 4th, Mr. A. Sanders, with Nymph; 5th, Mr. H. W. Wood, with Spring Street. Light roses: 1st and 2d, Mr. C. Turner, with Heuresse; 3d, Mr. C. Turner, with Mrs. Payne; 4th, Mr. Rowan, with the same; 5th, Mr. J. Hines, with Edith d'Ombrain; 5th, Mr. J. Douglas, with Mrs. Payne. In the class for light roses, Liddington's Favourite won all the prizes. Mr. J. Douglas being 1st and 2d, Mr. J. Lakin, 2d, Mr. W. Austiss, 4th, Mr. C. Turner, 5th. Yellow ground Picotees: 1st and 2d, Mr. J. Douglas, with Agnes Chambers; 3d and 4th, Mr. C. Turner, with Prince of Orange; 5th, name unknown, with Emlyson's Lotus; Rothchild.

For the premier Prize for a lot of six Mrs. Payne, shown by Mr. C. Turner in his stand of twenty-four varieties—a greatly refined flower, of full size and rich marking. Stands of self, fancy and yellow grounds were very effective, and seemed to please the visitors greatly. By a fancy may be meant a flower having a coloured ground, and stripes of some darker colour. "Run" flowers will occasionally take this form, and are then very handsome. The largest class was for twenty-four blooms, and here Mr. Turner was 1st, with a real beauty, lot, consisting of the following fancies—A. J. Southgate, Master Stanley, and Guardsman. Selfs: Mary Morris, Grosvenor, Mrs. Champneys, Chietain, Magog, Lady R. Molyneux, Sybil, W. P. Milner, Mrs. Bridgewater, Dan Godfrey, Rob Roy, Mrs. McLaren; and

yellow grounds, Prince of Orange, Janina, and Edith; 2d, Mr. James Douglas, all seedlings; 3d, Mr. M. Toby, 3, St. Mark's Grove, Fulham Road; 4th, Mr. T. Hooper; 5th, Mr. H. Catley, 16, Claverton Buildings, Bath.

In the class for twelve blooms there were eleven competing collections, some remarkably good flowers being shown, the best coming from Mr. A. Spurling, Blackheath, who had flaked flowers, Sir Toby Bell, Robert Lord, Marc Antony, and Fuson Morris. Self: Bride, Mrs. H. Morris, Jessica, The Doctor, Matador, and the following yellows.—Edith, Bride of Blackheath, and a seedling, Equid 2d, Mr. J. Lakin, and a stand not bearing an exhibitor's name; 3d, Mr. T. Austiss; 4th, Mr. L. Walker, Putnerish Road, Reading; 5th, Mr. C. Phillips. In the class for 12 blooms of yellow ground Picoetes five stands competed, Mr. J. Douglas being placed 1st with a very fine lot of seedlings, unnamed—a strain of great value that in the course of time must result in a grand strain of refined yellow ground Picoetes; 2d, Mr. C. Turner, who had the following named varieties in duplicate in a few instances—Thomas Page, Prince of Orange, Starlight, Mrs. Coleman, Janina, Mazzin, Lightning, and Princess Beatrice; 3d, Mr. A. Spurling; 4th, Mr. T. Hooper; 5th, Mr. H. Catley.

The following certificates of merit were awarded to cut bloom.—To Mr. Thomas Austiss, Brill, for Heavy purple edged Picoetes, the petals of a fine, stout pure petals, with broad edging of bright lilac-purple; somewhat in the way of Muriel, but quite distinct. To Mr. James Douglas, for yellow Picoete, Annie Douglas, yellow ground, edged with bright rose, large full good petal, bright and easy; to Mr. J. Douglas, for yellow Picoetes, S. B., Guardsman; C. B., Lord Milton; purple Picoete, Mrs. Nicholas; rose Picoetes: Orlando, Constance Heron, and Favourite; yellows: Prince of Orange and Edith; and white Clove Lady Rose Molyneux.

PLANTS.

In the class for nine specimens of Carnations or Picoetes in pots Mr. J. Douglas was 1st, with an admirably good and bloomed lot, consisting of Carnations: R. F., Diana, Miss Helen Lodge; P. F., James Douglas; rose edged Picoetes, Ethel and Favourite; and the following yellows:—Colonial Beauty, Florence, Edith, and Alma. 2d, Mr. C. Phillips, with a good lot, consisting of Carnations: S. B., Guardsman; C. B., Lord Milton; purple Picoete, Mrs. Nicholas; rose Picoetes: Orlando, Constance Heron, and Favourite; yellows: Prince of Orange and Edith; and white Clove Lady Rose Molyneux.

MISCELLANEOUS.

In the way of honorary contributions Messrs. Veitch & Sons had eight boxes of Carnations and Picoetes, including fancies and self-colours, a representative collection; Mr. T. S. Ware, Hale Farm Nurseries, Tottenham, six boxes of bunches of Carnations and Picoetes, arranged with great taste; and Messrs. Hooper & Co., Centre Row, Covent Garden, had six boxes of cut blooms, also of good quality and variety.

ROYAL HORTICULTURAL OF ABERDEEN.

FROM year to year the shows of this Society have varied in degrees of excellence. Many of the shows held in past years have been bigger, but few have been better than that opened on Thursday, the 22d inst. This year the entries have decreased to 650, as compared with over 1000 last year. There was special excitement in the show, which is to be taken into account. The Highland Society's show, which was held in Aberdeen last year, tended to make the horticultural exhibition greater than what it otherwise might have been.

The floor of the Music Hall was covered with tables, on which the exhibits were displayed. As heretofore there were four divisions in the show—professional gardeners, nurserymen, amateurs, and working men. Each of the sections was very worthily represented.

In the professional division the Queen presented a prize for a table of pot plants arranged for effect. The competition was interesting, and resulted in Mr. James Malcolm, Sunnyside Asylum, being 1st; Mr. Alexander Grigor, Fairfield, 2d; and Mr. Thomas Forest (Earl of Aberdeen), Haddo House, 3d. Among the other pot plants shown by professionals Ferns, Pelargoniums, and Fuchsias were noticeable for wealth of leafage. Among other prizes Mr. Edward Moorat, Stonewood, carried 1st honours for Ferns; and Mr. Scott, Aberdeen; although an amateur, successfully competed with a fine Lily among professionals. Mr. Ogg, Morven House, Mr. J. Healdy, Aberdeen, and Mr. Grigor, Fairfield, also competed successfully for pot plants.

For cut flowers Mr. Hunter, Richmond Hill; Mr. Robert Grigor, Sunnyside; Mr. James Mowat, Aberdeen; Mr. Alexander Kay, Westburn; and Mr. William Pope were the most successful exhibitors.

The show of fruit made by the professionals was not extensive, but good. The gentlemen who took the lead in other departments were also first here, but there was one peculiar feature in connection with this section. Mr. Alex. Milne, Aberdeen, carried off a challenge cup last year for Strawberries, after winning it twice. He has again won a challenge cup, presented by Lord Provost Matthews, for a similar exhibit.

In the vegetable department there was very little noticeable beyond the very fine Carrots. Mr. William Davidson, Aberdeen; Mr. Anderson, Lower Cornhill; Mr. Malcolm, Sunnyside; Mr. Reid, Urie; and Mr. William Scorgie, Summerhill, showed the best vegetables.

In the nursery section Messrs. Cocker & Son, Aberdeen, carried all before them. Amateurs exhibited a fine and large selection of pot plants. Mr. A. Gillespie, Aberdeen, showed a collection of British Ferns that would have done credit to any professional table. The other chief winners of prizes were Mr. Maitland, Woodside; Mr. William Silver, Auchmill; Mr. James Minty, and Mr. James A. Kemp, Aberdeen; and Mr. K. Hall, Belhelvie. The cut flowers sent by amateurs were not numerous, and in this section Mr. Duthie and Mr. Pope, Aberdeen, had matters pretty much their own way.

The turn out made by working men in pot plants, cut flowers, fruit and vegetables was very satisfactory indeed. A feature of the exhibition, and one that received general admiration, was the fine selection of herbaceous plants shown by Messrs. William Smith & Son, nurserymen, Aberdeen.

BEDFORDSHIRE AGRICULTURAL SOCIETY'S SHOW: July 21.

THE horticultural department of the annual show in connection with the Bedfordshire Agricultural Society, which was this year held at Luton on Wednesday week, afforded an excellent attraction to the numerous visitors, and the executive staff to be congratulated on the interesting display they were able to produce. The General Committee voted the sum of £170 for prizes, and the expenses of the department, and the managers used the money with considerable advantage. It was thought desirable to offer good prizes for collections of plants, flowers, and fruit, such as would attract the first growers in the country, rather than to give a multiplicity of small sums for ordinary productions. The outcome, therefore, was a show that was special in every case, and embraced some of the finest specimens of horticulture possible to bring together.

The marquee was of noble proportions, and allowed of the exhibits being staged so as to show off their merits to perfection. But a serious casualty occurred shortly before mid-day, and had not prompt action been taken, a great disaster would have befallen it. The marquee stood in a somewhat elevated position, and there was a strong breeze against its side. The iron stays for supporting the strain of the ropes were not sufficiently imbedded in the ground, and suddenly one side of the tent gave way, and with one fell swoop sent it entire table on that side, which had been splendidly set out with boxes of cut Roses and other flowers, into the plants grouped in the centre, breaking up the woodwork, and carrying with it two of the committee-men who were employed in giving the finishing touches to the show. It was an alarming accident, and the whole marquee seemed on the point of toppling over. From the damage such a catastrophe would have caused the show was happily saved, for it would have involved the destruction of several hundreds of pounds' worth of plants. By prompt and determined efforts the marquee was secured, and the damage rectified as far as possible.

In a little time the wind veered round and relieved the pressure which had produced such an alarming contingency.

PLANTS.

Ten exotic Orchids in flower, and six exotic Orchids in flower.—Although the prizes offered were good, there was but one collection in each of the classes, and both were furnished by that successful grower, Mr. James Cypher, of Cheltenham, and contained fine examples of *Cattleya crispata*, *C. Leopoldi*, *C. Gaskelliana*, *C. superba splendens*, *C. Harrisonica*, *Epidendrum vitellinum*, *Cypripedium grande* (hybrid), *C. Lawrenceanum*, *C. barbatum nigrum*, *Dendrobium Desei*, *Saccolabium Blumet*, and *Oncidium preteritum*. The beauty of these flowers, in their seemingly careless yet highly artistic arrangement, is wonderful.

Twelve stove and greenhouse plants, six flowering.—The 1st prize went to Mr. J. Cypher, Cheltenham, for magnificently grown and much admired specimens of *Ixora Filigium*, *L. Williamsi*, densely clothed with huge trusses of most exquisite flowers; *Kenia australis*, *K. posteriana*, *Croton Queen Victoria*, *Latania borbonica*, *Stephanotis floribunda*, *Erica retorta major*, *Allamanda grandiflora*, and *Cordyline indivisa*. The 2d prize was won by Mr. J. V. Mould of Pewsey, Wilts., for a capital lot which included *Ixora Regine*, *Statice Butcheri*, *Cycas revoluta*, *Allamanda nobilis*, *Gleichenia Mendellii*, *Calosanthus Frederick des Bois*, and *Cocos Weddelliana*, perhaps the most elegant of all the smaller Palms, of which so many charming species are now to be found in cultivation.

Extra prizes were awarded to exhibits in this divi-

sion from Madame de Falhe (gr., Mr. W. M. Baillie), Luton 1100; Mr. Cypher, and Mr. Mould.

Six stove and greenhouse plants, three flowering.—This was also easily won by Mr. J. Cypher with *Ixora Filigium*, *Bougainvillea*, *Erica Thompsoni*, and *Cycas circinalis*. Mr. J. F. Mould, of Pewsey, carried off 2d prize, and C. R. Fenwick, Esq. (gr., Mr. G. Underwood), High Firs, Harpenden, ran a good 3d, with six as clean and creditably grown plants as it was possible to display. This was a noteworthy collection, and was awarded by the judges an extra prize.

Six stove and greenhouse Ferns.—In this class there were four competitors, and each staged charming and well-finished exhibits, the 1st going to Mr. J. Cypher, the 2d to W. Tindall Lucas, Esq., Foxholes, H1 thin; and the 3d to C. R. Fenwick, Esq. (gr., Mr. G. Underwood), High Firs, Harpenden.

Fuchsias were poorly represented, one collection from Mr. John Cumberland, of Luton, only being secured, to whom was awarded the 2d prize.

ROSES.

Forty-eight cut Roses, distinct.—Mr. Frank Cant, of Colchester, one of the most successful Rose growers in England, carried off premier honours for magnificent blooms of his best varieties, comprising, amongst others, *Horace Veret*, a truly grand Rose; *Innocent Pirola*, *Rosierist Jacobs*, *Star of Waltham*, *Madame Gabriel Luizet*, *Lord Frederick Cavendish*, a dazzling scarlet of beautiful finish; *Madame Victor Verdier*, *Niphetos*, *Abel Carrère*, *Alphonse Soupert*, *Union Bruner*, *Duke of Connaught*, and *Comtesse of Oxford*, &c. Messrs. J. Durrell & Co., of Cambridge, were 2d with a collection in good variety and excellent condition; Mr. William Rumsey, Waltham Cross, being 3d. An extra prize was awarded to the Rev. W. Jackson, Stagden Vicarage, Bedford.

Mr. William Paul, whose association with Roses is well known, exhibited one of the finest collections we ever remember to have seen, not for competition—the climbing *Tea* and *Noisette* Roses, arranged in baskets, being a grand feature.

FRUIT.

The display of fruit was, upon the whole, good, and well represented. 1st place for a collection of eight sorts, Pine excluded, was allotted to Messrs. Rothschild, Gunnersbury Park, Acton (gr., Mr. J. Roberts), with examples of *Violette Hative Peach*, *Muscot of Alexandria Grape*, *Brown Turkey Fig*, *Golden Perfection Melon*, *British Queen Strawberry*, *Madresfield Court Grape*, *Digareux Napoleon Cherry*, and *Lord Napier Peach*. The 2d, 3d, 4th, 5th, 6th, 7th, 8th, 9th, 10th, 11th, 12th, 13th, 14th, 15th, 16th, 17th, 18th, 19th, 20th, 21st, 22nd, 23rd, 24th, 25th, 26th, 27th, 28th, 29th, 30th, 31st, 32nd, 33rd, 34th, 35th, 36th, 37th, 38th, 39th, 40th, 41st, 42nd, 43rd, 44th, 45th, 46th, 47th, 48th, 49th, 50th, 51st, 52nd, 53rd, 54th, 55th, 56th, 57th, 58th, 59th, 60th, 61st, 62nd, 63rd, 64th, 65th, 66th, 67th, 68th, 69th, 70th, 71st, 72nd, 73rd, 74th, 75th, 76th, 77th, 78th, 79th, 80th, 81st, 82nd, 83rd, 84th, 85th, 86th, 87th, 88th, 89th, 90th, 91st, 92nd, 93rd, 94th, 95th, 96th, 97th, 98th, 99th, 100th.

In the Grape classes there was abundant and keen competition. For two bunches of white Grapes, J. F. Hasley, Esq., M.P., Gaddesden Place, Herts (gr., Mr. H. Folkes), was 1st with neat compact bunches of *Muscot of Alexandria*; 2d, Mr. J. Roberts, with *Foster's Seedling*; 3d, Mr. J. H. Goodacre.

For two bunches of black Grapes E. M. Mundy, Esq., Shipley Hall, Derby (gr., Mr. W. Elphinstone), carried off 1st with some fine black Hamburgs, Mr. Goodacre ranking 2d, and Mr. G. T. Miles, Wycombe Abbey, being 3d.

Pines were shown of excellent merit, premium honours going to Mr. G. T. Miles; 2d, Mr. J. Roberts; and 3d to Mr. J. H. Goodacre.

Visitors seemed rather sparse in the early hours of the exhibition, but as the day advanced the few became hundreds, and increased to thousands in the course of the afternoon and evening.

NEWCASTLE SHOW.

ON July 21, 22, and 23, the sixty-third summer show of the Durham, Northumberland, and Newcastle Incorporated Botanical and Horticultural Society was held, under auspicious circumstances, in the Leazes Park, Newcastle. This show has become of late years one of the most popular of north-country *shows*, and at this meeting there was a very large attendance of members and the general public. The entries received for plants were quite up to the average attained in previous years, but when the generosity of the Society in the matter of prize money is taken into consideration, this is not at all to be wondered at. The entries included exhibits from prominent botanists and horticulturists in all parts of the country. There was a very large display of flowers in bloom, and the majority of the plants were of rare beauty. The fruit was of great quantity and of admirable quality. Exhibits were displayed by the gardeners of the following, amongst others:—The Duchesses Dowager of Roxburgh, Dunbar; the Duke of St. Alban's, Arnold, Notts; the Hon. and Rev. R. F. Grey, Morpeth; Sir J. W. Pease, M.P., Gushoing; Mr. T. Fry, M.P., Darlington; Mr. Lindsay Wood, Chester-le-Street; Mr. A. R. Glad-

stone, Liverpool; Mr. J. Trotter, Annisford; Mr. William Whiting, Shotley; Mr. A. Pease, Hammersknot; and Mr. J. R. Chard, Clapham Common, London.

Messrs. William Fell & Co., Hexham, exhibited a good collection of Conifers in pots, viz., *Cupressus laeta*, *Thuja Lobbi*, and a very pretty Japan Maple. Roses and hardy herbaceous plants were very prominent on this stand, and so a very pretty semi-double blue *Lobelia* (raised by Messrs. Fell & Co.). Ivis were most conspicuous, especially the variegated varieties. The exhibits of this firm were highly creditable. In the early morning of the opening day the weather gave every promise of being all that the promoters of the show could desire, but gradually a strong wind arose and their grew decidedly chilly. This, however, did not affect the attendance in the afternoon.

Between five and six o'clock in the evening a very severe, but not very prolonged, thunderstorm broke over Newcastle, and the weather during the rest of the evening was damp and threatening. This resulted in a very much smaller attendance than was expected. The receipts at the gates for the day amounted to £163, against £235 for the first day of the summer show last year; being a decrease of £72.

NOTES FROM DUBLIN.

MUTISIA DECURRENS.—A beautiful climbing Composite from Chili is now very full of flower here, and promises to give a succession of its vivid orange-scarlet *Gazania*-like flowers for some weeks longer.

GYMNADENIA CONOPSEA

varies much in Ireland. The enclosed are two spikes from a pot plant, the tubers having been dug in flower last year and potted at once. The spikes from the pot this season are very fine, and as sweet-scented as Stocks.

PAPAVER SETIGERUM.

I send also a plant of two of what Mr. J. S. Baker, F.R.S., tells me is *Papaver setigerum*, DC., a plant supposed by De Candolle (*Origin of Cultivated Plants*) to be the parent of the opium Poppy (*P. somniferum*) of to-day. The seeds were brought from the banks of the Nile a few months ago, by the Rev. J. P. Mahaffy, LL.D., who very kindly thought of our garden when on a pilgrimage to the tombs and temples of Thebes. This Poppy has six-rayed stigmas, while the garden or spurious opium Poppy is generally eight to ten-rayed, and the true large-fruited opium Poppy of the druggists' shops has from ten to thirteen rays. It grows from 6 to 8 inches in height, and bears white flowers with contorted petals, and is rather pretty.

APOCYNUM ANDROSÆMIFOLIUM.

This curious old Dogbane is figured in Darwin's *Bolanic Garden*, and is interesting from its fly-catching habit. It is a by no means ineffective garden plant to boot.

DOUBLE LILIES.

These do not please all alike. I enclose a great rarity—the double Martagon—of which I have so far failed to find any record in books. Is it mentioned in Elwes' Monograph or not? [No. It is enumerated in Masters' *Vegetable Teratology*.] It is very distinct, and some years *Heriotes*, I having had it here with twenty to thirty flowers on a stem. This year the drought has ruined it. I hope all who know or grow it will tell us of its history.

The double white Lily is botanically interesting, and, as Parkinson says, may be grown in the gardens of the curious. Properly speaking, its "flowers" are simply plumes of white bracts, arranged like the leaves alternately on the stem, and not in whorls, as in the properly developed blossoms of this species.

It is general known in gardens that there are two (at least) very distinct forms of the common white Lily (*L. candidum*). The common variety or type has three inner lobes of the perianth very much wider than the outer ones, while in the other form the perianth-lobes are equal in width, and of a more delicate whiteness throughout. Its habit or port is also more elegant as seen growing.

Perhaps the best of all the double Lilies is *L. tigrinum* n.-pl., which in some places grows 6–8 feet high, and opens its blossoms well. The great fault of all the truly double Lilies is their tendency to fail in flowering except under the most congenial of conditions

WHITE VIOLAS.

I am told *Viola Snowdrop*, sent out by Messrs. Dickson, of Edinburgh, is one of the best of all, but having never seen it, I cannot judge. Herewith I send you a small bunch of a variety named Mrs. Clarke, raised at Wemyss Castle, Fife, and I think also sent out by Messrs. Dickson. If *Snowdrop* beats Mrs. Clarke I think it must be good indeed. I shall never forget a visit I made to the Pilgrimage Park Nurseries, when I was last in Edinburgh, where I saw Pansies, Violas, Carnations, Pinks, and Pentstemons by the acre, grown as one only sees them in the cold, stern northern air, which braces up strong men as well as strong plants. I have a very pleasant souvenir of that visit now in flower here—no less an old rariety and fiercer than *Fuchsia albo-coccinea*, a most distinct and floriferous old variety, not often to be found as I imagine in modern nurseries. I think if I were asked to recommend a holiday outing to gardeners—especially Southern ones—I should say to go to Edinburgh. You will see there a noble city—you are in a very focus-spot of gardens—and if properly accredited, you will meet with some of the most able and genial of all the gardeners in the world. F. H. B.

THE COLONIAL EXHIBITION.

NO. VII.

NATAL.—The exhibits from this colony, though numerous, are of the usual varied character generally seen at exhibitions. It is interesting, however, to note the progress made in the colony in the cultivation and preparation of several important products. Tea, for instance, makes a very good show, both in the number of exhibitors and the appearance of the article itself. From the official catalogue of the Natal contributions, Tea is described as one of the most recently introduced articles of export. In the season 1881-82 the first 500 lb. of Tea grown in Natal from seed were produced and placed in the market. At the present time there are under Tea cultivation in Natal "282 acres in Victoria County, 20 acres in Durban County, 70 acres in the Lower Umzimkulu division, and about 200 additional acres are in preparation. The yield per acre has been exceedingly large, amounting in three years to 200 lb. of dry Tea; in four to 400 lb.; in five to 600 lb.; in six to 800 lb." The first fruit of this new industry is furnished in the samples exhibited. The value of Tea exported from Natal in 1883 was returned as £1499.

Amongst fruits, besides Peaches, Apples and similar well-known products, are samples of the *Amatungulu* or *Natal Plum* (*Carissa* [*Arduina*] *grandiflora*), an Apocynaceous shrub with large spines. The fruit when fully ripe has a pleasant refreshing flavour. This and the Cape Gooseberry (*Physalis peruviana*) are probably the two best fruits of the colony. The latter is stated to be "constantly seen in great abundance on the table of the South African steamships." Both the *Amatungulu* and the Cape Gooseberry make excellent preserves. The yellow or St. Helena Peach is described as being so abundant in the orchards of the Dutch farms that it is often used for feeding pigs, and the ground under the trees of deserted orchards sometimes becomes paved with the stones of the fallen fruit.

Amongst tanning materials the two least known, but at the same time interesting substances, are *Intolwana bark* and root of *Elephantorrhiza Burchellii*, and *Umgwenga bark* (*Larporphyllum caffrum*). The former has attracted some attention of late on account of the high percentage of tannin it is said to contain.

WEST AFRICAN SETTLEMENTS.

The exhibits from Sierra Leone, Gambia, Lagos, and the Gold Coast are extremely numerous, and very varied. Here are fine large samples of Benne seeds (*Sesamum indicum*), Guinea grains (*Amonum melagueta*), Physic nuts (*Jatropha curcas*), Palm nuts (*Elais guineensis*), and other well known African products. Under the name of *Corkwood* nuts are shown the kernels of what appears to be a species of *Aleurites*—heated and pressed they are said to give an oil equal to Olive oil.

From Lagos are many interesting though to outward appearance unattractive exhibits of natural produce, including some very fine masses of crude native indigo, and some remarkable candles, consisting of from ten to twelve seeds about the size of a Hazel nut strung on a piece of the petiole of a Palm. The seeds are called *Varach* seeds, but we are unable

to identify them botanically. Each one of these curious candles is said to give an uninterrupted light for one and a half hours. Some very fine balls of indiarubber are exhibited from the Gold Coast, as well as some large masses of an opaque fossil gum, labelled "Gum Copal, from the interior," which we do not remember to have seen before; *Kola nuts* (*Cola acuminata*), and *Tiger nuts* (*Cyperus esculentus*), are also shown.

CEYLON.

From all points of view the collection from Ceylon is one of great interest. Tea, as might be supposed, occupies a prominent position. Numerous samples being exhibited, some apparently of excellent quality. The preparation of Tea for the market is well illustrated by a series of photographs. In the course of ten years the Tea industry has marvelously increased in Ceylon. In 1876, 282 lb. only were exported, and in 1885 it had reached 3,796,684 lb.—this increase being the result of a high quality Tea, the distinguishing characters of which are described as richness of flavour combined with strength—"the results of most careful cultivation and systematic attention to every detail of manufacture." In the excellent *Illustrated Handbook and Catalogue for Ceylon*, which has recently been published, it is said that "On a Ceylon Tea estate the leaf is never allowed to be handled from the moment it passes into the factory to the time it is bulked in a huge heap preparatory to packing in chests; every stage in the delicate operation is passed automatically, and thus the most rigorous cleanliness and freedom from possible taint is secured."

Amongst spices, Cinnamon takes the most prominent place. Magnificent bundles of this bark are shown, together with chips and clippings. These chips, it seems, are largely used in the manufacture of Thorley's cattle food, as well as in perfumery, and in the distillation of Cinnamon oil, a good deal of which is also made in the island. *Jaggery*, which is a coarse description of sugar obtained chiefly from the *Palmyra Palm* (*Borassus flabelliformis*), was exported from the northern province of the island during the past year to the extent of nearly 7000 cwt., valued at £2000. Besides this large consumption of *Jaggery* in Ceylon, the trade might be made one of great importance, as there is at present an active demand from Europe.

Under dyes and dye stuffs we find *Jack-wood*, the wood of *Artocarpus integrifolia*, which, it is said, "dyes an extremely useful yellow, and is used by the natives for dyeing house mats, fibres for ornament, as well as for giving to cotton and silk cloths the peculiar pale canary colour which is required for the robes of the Buddhist priesthood. It is not exported."

Of *Anatto*, of which there are some fine examples, both of seeds and paste, the *Handbook* says:—"This useful and rather delicate orange red dye is obtained from the pulp surrounding the seeds of *Bixa orellana*. This dye is largely used in Europe and India in dyeing silks and also for colouring cheese and other articles. The pulpy matter is separated from the seeds by boiling, and when dried pressed into cakes and shipped. It is imported into England chiefly from French Guiana, where it is native; but the plant is an ancient introduction to Ceylon and is now semi-wild."

Besides a large collection of small wood specimens, of which there is published an excellent list, there are some remarkably fine examples of the choicer cabinet woods such as *Calamander*, *Tamarind*, *Satinwood*, &c. Of the first of these, obtained from *Diospyros quercita*, it is unsatisfactory to know that it is becoming extremely scarce. The tree is a slow growth and the forests in the south of Ceylon are now denuded of all their *Calamander* trees of a size suitable for furnishing cabinet wood. Of *Satinwood* the produce of *Chloroxylon Swietenia* we also learn from the *Handbook* that the "Swites are common enough in the northern, eastern, and north-western forests, but the proportion of these which yield 'flowered *Satinwood*' is very small, and this description of wood is therefore comparatively high in price. One would not think there was any scarcity in *Satinwood* when one sees such elaborate show-cases made of it in which the Ceylon Teas are exhibited, and the use to which it seems to be put in Ceylon for carriage building.

The Ceylon court is well arranged, and the *Handbook and Catalogue* is one of the best of the Exhibition Series. *John K. Jackson, Curator, Museums, Royal Gardens, Kew.*

FUCHSIAS AT CHISWICK.

A GRAND collection of these plants (indeed, imparting quite a feature to the old garden) is now on view in the Paxton house at Chiswick. Paxton and Chiswick! what magic is contained in these words. Paxton, he who has been well and truly styled "the Prince of Gardeners"—what lustre the name sheds, and will shed, upon old Chiswick—the cradle of his reputation, for it was here that he began that career which reflected so much credit on gardeners. But to our task—which must, on account of our limited space, be a very brief one, singling out only some of the more striking sorts.

To begin, then, with Madame Thilaut, a grand variety, one of Lemoine's seedlings, introduced to commerce about two years ago; red tube and sepals, vermilion corolla. Flowers produced in large trusses at the extreme points of the shoots; a decided acquisition. Dr. Sankey is also a somewhat new variety, similar in colour to the preceding, but distinct; very free flowered. Harry Brooks, red tube and sepals, corolla purple; fine habit. Rose of Denmark, white tube and sepals; pink corolla, strong grower. Sedan, self-coloured flower, beautiful habit and free bloomer. Monarch is also another good single self, very free and fine. Mr. Mein, tube and sepals scarlet, white corolla; good. Desideratum, scarlet tube and sepals, bright blue corolla. Aurora superba, salmon tube, and sepals tinged with yellow; free bloomer. Earl of Beaconsfield, orange-yellow flowers, not handsome, but produced in large clusters. Mr. King, scarlet tube and sepals, purple corolla; fine habit. Berliner Kind, tube and sepals scarlet, white corolla; very fine habit. Pendululora, a robust and distinct variety, the leaves and tubes are from 3 to 4 inches long, flowers crimson.

Amongst single light varieties the old but still good Rose of Castille well maintains its position.

In doubles note was made of the following:—Avalanche, scarlet tubes and sepals, dark purple corolla, very fine, good habit; one of the best, although not one of the newest sorts. Little Alice, tube and sepals scarlet, corolla white; neat both in bloom and habit. One of the best probably in the double whites is Elizabeth Marshall, a very free flowering variety; Nellie Morton is also an acquisition in this class.

We have not mentioned a tith of the good things to be seen now in the Fuchsia way at Chiswick, but probably enough has been said to recommend such plants, did they need such recommendation, as useful subjects for the decoration of the greenhouse or conservatory, their charming pendulous, variously coloured blossoms giving an added grace to the wealth of healthy green foliage with which they are clothed. B.

Variorum.

PHENOLOGICAL OBSERVATIONS IN SWEDEN.—R. Hult has discussed the mass of phenological observations accumulated for the last ten years in Sweden. 157 stations have afforded about 150,000 observations. The previous labours of the French botanist, Adanson, had shown that the development of the buds is determined by the sum of the daily mean temperatures since the beginning of the year. Boussingault had, however, shown that the temperature during the period of rest from growth need not be taken into consideration, and that the length of the growing period is therefore inversely proportional to its mean temperature. Linsser concluded that the sums of the temperatures above zero which are necessary to effect development of a plant at any two localities are in direct ratio to the sums of all temperatures at both stations above zero. J. Sachs, the ablest botanical physiologist of the present time, has studied the subject from an entirely different side. He has by direct experiment with direct plants determined the influence of temperature on the development and growth, and found that for each arrangement of external conditions about any plant there is a minimum, a best, and a maximum temperature. That is to say, a certain amount of heat is necessary, namely, the temperature minimum; an increase of temperature accelerates the development up to a certain limit, which is the best temperature; every increase above this retards the development up to a certain limit, which is the maximum possible, beyond which the growth of the plant must

cease. The results attained by Hult do not entirely agree with any of the preceding. He finds that the precipitation in Sweden is nowhere so slight that vegetation is regularly restricted, nowhere so great that the blossoming or leafing is disturbed, but the ripening of the fruit occurs at the season of greatest rainfall, and this stage of plant growth is affected by the rain. The blossoming of any plant throughout the whole of Sweden occurs at the same temperature, but when we pass to Lapland and Jemland, the very rapid progress of the spring temperature cannot be followed by the plant, and the blossoming occurs subsequent to the occurrence of the normal temperature. *Journal of the Austrian Meteorological Society*, XIX., p. 139.

CINCHONA CULTIVATION IN CEYLON.—Perhaps the most successful piece of Cinchona cultivation in Ceylon of its age and extent is found in a well-known plantation in the neighbourhood of Nuwara Eliya, and some particulars we have learned of the same may be of interest. The area under Cinchona is about 90 acres, trees five to seven years of age, about 3000 trees to the acre. Since 1878 there have been gathered about 105,000 lb. of good bark, and 72,000 lb. of branch and dust. The total output is good bark selling up to 2s. a pound, and the branch and inferior for a good few cents locally, it may be judged that the investment is a very profitable one, more probably not over 70,000 rupees, so with much of the particularly since the estate still looks, with perhaps 250,000 trees, as if had never been cropped, and it cannot be worth less as it stands than £10,000 sterling. The great success of this plantation is, however, specially exceptional, standing out in bold relief to many disappointments.

CITRON.—In recent Consular reports appear interesting accounts of this well-known ingredient of plum-puddings and wedding-cakes. Leghorn Citron is what it is usually termed, but little or none of the article is grown there, Sicily and Corsica furnishing the supply of the new fruit. The Citron tree is of the Citrus variety, and is as near like Lemon as it can well be. It is propagated principally from cuttings, and flourishes near the sea in sheltered positions and in warm and sandy soil. The tree resembles somewhat an overgrown bush, and as the Citrons often weigh from 6 to 8 lb. each, the branches of the tree must be supported by props. The trees are subject to peculiar constitutional diseases which kill without mercy. As the profit of the grower depends largely upon his favourable situation, &c., it is hard to make even a rough estimate of the business. Supposing the trees to be planted 3 yards apart, and allowing fourteen Citrons to each shrub, the average weight of the fruit per acre would be 9346 lb. The price of this fruit in Leghorn is about 6 cents per pound, but from this must be deducted cost of casks in which fruit is shipped, 30ds.; cost of cutting and packing the fruit, 2 dols. per cask; general expenses of Citron farm estimated at 68 dols. per acre. The Corsican or Sicilian grower packs the fruit cut in halves, in casks with brine, and ships to Leghorn, where are nine factories for candying Citron, employing 300 men. On arrival there in these casks the fruit looks like huge Lemons with tremendously thick rinds and little substance inside. They remain in pickle some thirty days, and are tough and bitter. They are then boiled in fresh water till soft, cut into quarters, and all the seeds carefully removed. They are then placed in jars with hot syrup, and for about three weeks the proportion of syrup is constantly increased until no more sugar can be absorbed. The proportion is 80 per cent. of sugar to 100 per cent. of fruit. The quarters are then placed on wire-netting to dry, and when ready are packed in the small wooden boxes so familiar to us. Citron, in short, may be described roughly as the thick peel of a species of Lemon, pickled to extract its bitter flavour and absorb the oil, boiled to make it tender, and saturated with sugar to make it palatable. As with other articles of commerce, so it is complained that the prices of Citron are largely regulated by speculation, varying from 19 cents to 12 cents per pound at Leghorn. A curious fact is that more Citron is imported into Italy than exported from it, the proportion for the last three years being as ten to one. The soil of Cuba is eminently adapted for the Citron shrub; but few trees are, however, grown there, everything being abandoned for the staple crop—Sugar-cane. It seems so hard for communities to learn the lesson of diversified crops; all Sugar-cane,

all Cotton, or all Wheat apparently must be expected. Cuba, Mexico, and California offer advantages in the culture of Citrus fruits, and are only awaiting enterprise to develop these profitable pursuits, *American Grover*.

PANSIES.—These flowers are always acceptable, and their enforced departure from most south country gardens during the warmer months of the year is generally a matter of regret. It seems that there are some situations—probably on cool clay soils, or in shady valleys in the home counties, where these flowers can be well flowered in July, as was evident from a sample sent to our office recently by Messrs. Collins Brothers & Gabriel, Plant Merchants and Seedsmen, 39, Waterloo Road, South London. There were altogether eighteen varieties by name, the colours being red-purple, blue-purple, lilac-purple and white, creamy-white, yellow and white, some of the flowers being very nicely fragrant, as Lady Polworth elegans, Ardwell Gem and Brilliant, and all were desirable for beds, borders, and as edgings to other plants in beds.

The Weather.

STATE OF THE WEATHER AT CLICKEATH, LONDON. FOR THE WEEK ENDING WEDNESDAY, JULY 28, 1886.

MONTH AND DAY.	BAROMETER.		TEMPERATURE OF THE AIR.		Hydro-metrical Observations from Clinometer's Tables 27th Edition.	WIND.	RAINFALL.

- July 22.—Fine bright day; strong wind.
- 23.—Dull day; rain from 4 P.M.
- 24.—Dull in early morning; fine and bright generally.
- 25.—Rain in early morning; dull day.
- 26.—Heavy rain in early morning; finer from 9 A.M.; fine and bright generally.
- 27.—Dull day.
- 28.—Fine and bright in early morning; fine but dull day.

LONDON: Atmospheric Pressure.—During the week ending July 24, the reading of the barometer at the level of the sea decreased from 29.99 inches at the beginning of the week, to 29.76 inches by 5 P.M. on the 18th, increased to 29.81 inches by 1 P.M. on the 19th, decreased to 29.79 inches by 5 P.M. on the same day, increased to 30.07 inches by 1 P.M. on the 20th, decreased to 29.80 inches by 5 P.M. on the 21st, increased to 29.86 inches by 9 A.M. on the 22d, decreased to 29.60 inches by 9 A.M. on the 24th, and was 29.69 inches by the end of the week.

The mean reading of the barometer for the week at the level of the sea was 29.82 inches, being 0.06 inch lower than last week, and 0.16 inch below the average of the week.

Temperature.—The highest temperature in the shade in the week was 84° on the 21st; on the 23d the highest was 79°. The mean of the seven high day temperatures was 74°.8.

The lowest temperature was 52° on the 20th, on the 22d, the lowest was 58°. The mean of the seven low night temperatures was 56°.1.

The greatest range of temperature in one day was 27°, on the 21st; on the 23d the smallest was 10°. The mean of the seven daily ranges was 18°.7.

The mean temperatures were, on the 18th, 67°.5; on the 19th, 63°.1; on the 20th, 62°.6; on the 21st, 70°.9; on the 22d, 65°.3; on the 23d, 66°.6; and on the 24th, 62°.6; and these were all above their averages (excepting the 23d, which was 1°.6 below) by 4°.9, 0°.6, 0°.2, 8°.6, 3°.0, and 0°.4 respectively.

SEEDS.

LONDON: July 28.—Messrs. John Shaw & Sons, of 37, Mark Lane, London, E.C., report to-day's seed market poorly attended, with hardly any transactions passing. Cloverseeds of all kinds, as might be expected, are for the moment neglected. Higher prices for white are again reported from Germany. More money is asked for Trifolium; new English samples show fair quality. Samples of this year's Rapeseed, Rye, Trifolium, and also of French-India, are now coming to hand. For Canary and Hempseed the tendency of rates is downwards. Feeding Linseed keeps firm.

CORN.

MARK LANE: July 26.—The Wheat trade to-day was somewhat disappointing. East India Wheats compared 6d. above the rates of Monday last, but no advance could be quoted on any other description. The demand for flour was very slack. Barley continues to arrive slowly, and is taken off in much the same way, prices ruling firm. With prolonged scarcity Egyptian Beans further advanced 6d. per quarter. Peas met a quiet demand at unaltered value. Heavy Swedish Oats showed an advance; the common qualities remained dull.

Average prices of corn for the week ending July 21:—Wheat, 31s. 3d.; Barley, 23s. 9d.; Oats, 20s. 7d. For the corresponding period last year:—Wheat, 33s. 11d.; Barley, 25s.; Oats, 21s. 8d.

FRUITS AND VEGETABLES.

COLUMBIA (East London): July 28.—Plentiful supplies of all kinds, trade fair, prices lower. (Quotations:—Red Currants, 3s. to 3s. 3d. per half sieve; black Currants, 3s. do.; Cherries, 2s. 6d. to 3s. 6d. do.; Gooseberries (ripe), 3s. do.; Plums, 2s. 6d. to 3s. 6d. do.; Strawberries, 3s. to 4s. per peck; Scarlet Beans, 6s. to 7s. per sieve; Peas, 5s. to 7s. per sack; Broad Beans, 2s. per sieve; Cabbages, 5s. to 6s. 6d. per tally; bunch Spring Onions, 3s. to 4s. 6d. per dozen; bunch Turnips, 2s. to 2s. 6d. do.; bunch Carrots, 2s. to 3s. do.; bunch Parsley, 2s. to 2s. 6d. do.; bunch Mint, 2s. do.

STRATFORD: July 27.—Supplies have been good and a fair trade has been done at the following prices:—Cabbages, 3s. to 5s. per tally; Turnips, 2s. 6d. to 3s. per dozen bunches; Carrots, household, 2s. 6d. to 3s. do.; Green Gages, 3s. to 4s. 6d. per dozen; bunch Turnips, 2s. to 2s. 6d. do.; bunch Carrots, 2s. to 3s. do.; 5s. 9d. to 7s. per basket; do. black, 3s. to 5s. do.; black Currants, 2s. 6d. to 3s. 3d. do.; do. red, 2s. 6d. to 3s. do.; Cucumbers, 8d. to 1s. 4d. per dozen; green Peas, 3s. 6d. to 4s. per bag; Parsley, 3d. per dozen; Peas, 11d. per bunch; Tomatoes, 1s. to 1s. 6d. per dozen.

POTATOS.

BOROUGH AND SPITALFIELDS: July 27.—Supplies increase with the advance of the season, and prices rule in favour of the consumer. Quotations:—Essex kidneys, 6s. to 6s.; Kent Regents, 5s. to 7s.; Jersey and French kidneys, 5s. to 7s.; Cherbourg kidney, 3s. 6d. to 4s. 6d. per cwt.

COLUMBIA (East London): July 28.—Quotations:—Early Rose, 4s. to 5s.; Beauty of Hebron, 5s. to 5s. 6d.; Jersey kidneys, 6s. to 6s. 6d.; do. rounds, 4s. to 4s. 6d.; St. Malo kidneys, 5s. to 5s. 6d.; do. rounds, 4s. to 4s. 6d.; Cherbourg kidneys, 6s.; do. rounds, 4s. to 4s. 6d. per cwt.

STRATFORD: July 27.—Quotations:—Jersey, 5s. 6d. to 6s. per cwt.; do. Rose, 70s. to 80s.; Hebron, 50s. to 100s. per ton.

Imports.—The imports into London last week consisted of 4293 packages Cherbourg, 6308 Jersey, 40 sacks Boulogne, 486 boxes 624 cases 18 tons from Barfleur.

HAY.

WHITECHAPEL: July 27.—Trade very dull, with large supplies, and a decidedly drooping tendency in prices. Quotations:—Clover, prime, 60s. to 108s.; inferior, 70s. to 85s.; hay, prime, 30s. to 95s.; inferior, 45s. to 65s.; and straw, 20s. to 37s. per load.

STRATFORD: July 27.—There was a large supply on sale. The trade was very dull, and prices were easier for hay.

STRATFORD: July 27.—Hay, 80s. to 100s.; Clover, 90s. to 110s.; and straw, 30s. to 100s.

Government Stock.—Consols closed on Monday, Tuesday, Wednesday, and Thursday, at 101½ to 101¼ for both delivery and the account.

WILLIAM J. VIAN, Secretary.

HILL AND SMITH'S BLACK VARNISH, for Preserving Ironwork, Wood, or Stone.

This VARNISH is an excellent substitute for oil paint or any outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of forty years ago by the Advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requiring no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of most of the Nobility and Gentry, from whom the most flattering testimonials have been received.
Sold in Casks of about 30 gallons each, at 12. 6d. per gallon, at the Manufactory, or 12. 6d. per gallon carriage paid to any Station to the Kingdom.

UNSOLICITED TESTIMONIAL.
From ALFRED LOWE, Esq., The Ryloys, Abberley Lodge.
"Some twenty years ago I used your Black Varnish, and shall be glad if you will forward me a cask, as I consider it the best thing known for the preservation of all outdoor work, either wood or iron, that requires to be painted."
CAUTION.—Hill & Smith would particularly warn their Customers against the various cheap Varnishes now so much advertised.
Every cask is legibly marked with their name and Registered Trade Mark as above, without which one is genuine.
Large Illustrated CATALOGUE on Pencils, Hurdles, Field and Entrance Gates, &c., sent free on application to

HILL & SMITH, Briery Hill Ironworks, near Dudley; 118, Queen Victoria Street, London, E.C.; and 16, Stephen's Green, Dublin.

WANT PLACES.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be filled in payable to No. 43, DRURY LANE, to be J. H. RICHARDS, as, unless the Number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE ORDER.

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.

Advertisements requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisement which they wish Repeated.

TO LANDED PROPRIETORS, &c.—A. McINTYRE (late of Victoria Park) is now at liberty to undertake Formation and Planting of New Garden and Park Grounds, and Re-planting of existing ones prepared. 115, Lustra Park, Stamford Hill, N.

USEFUL MAN.—Well up in Building and Repairing Greenhouses in every branch; also good in every branch of Horticulture.—Wages and particulars to HILL, 5, Osborne Terrace, Goldsmith's Place, Kilburn, N.W.

HOLLOWAY'S OINTMENT AND PILLS.

—A frequent cause of gout and rheumatism is the inflammatory state of the blood, attended with bad digestion and constipation. A few of the Pills taken in time are an effectual preventative against gout and rheumatism. Any one who has an attack of either should use Holloway's Pills at once, and also the powerful Ointment, combined with the operation of the Pills, must infallibly effect a cure. These Pills act directly on the blood, which they purify and improve. They are once administered, and the system is in accordance with the Ointment, after fomenting the affected joints with warm brine will speedily relax all stiffness and prevent any permanent contraction.

NEW CYPRIPEDIUM—offered for the first time.

CYPRIPEDIUM SANDERIANUM is figured and fully described in the *Reichenbachia*. It stands by itself in its singular and quaint beauty, and is the only *Cypripedium*, besides *caudatum*, producing flowers with tails 18 and 20 inches long. It produces three flowers and more on the stem, the petals are very broad at the base, and of a reddish-purple, mottled with a light hue; the tail-like part is black-purple, and the tips are quite blunt, covered with thick hairs. The pouch is a dark brownish-red. It is altogether a showy, remarkable, and fine new Orchid.

Professor REICHENBACH, in describing it, says:—"This is an extraordinary surprise, as well as a great beauty, from the Malayan Archipelago. It is a great pleasure to dedicate this fine novelty to Mr. F. Sander."

On view morning of Sale, and Catalogues had.

NEW MAGNIFICENT ORCHID, DENDROBIUM STRATIOTES, RCHB. F.

"A highly curious and marvellous *Dendrobe*, Rchb. f." See *Gardeners' Chronicle*, February 27, 1886, page 266.

Good Healthy Plants, with strong growths, 42s., 84s., and 210s., according to size.

SENT FREE OF CHARGE TO ANY PART OF THE UNITED KINGDOM.

REICHENBACHIA' ORCHIDS ILLUSTRATED AND DESCRIBED.

By F. SANDER, St. Alban's.

This Work is issued in Monthly Parts, each containing four beautifully Coloured Plates by eminent Floral Artists.

The History and Culture of each Plant is given in English, French, and German. The Latin Descriptions and Leaders, &c., by Professor Reichenbach.

Price of each Number to Subscribers, 7s. 6d. per Month.

Size of Plates, 21 inches by 15 inches.

Sample Copies post-free on application, to be returned in case of non-subscription to

F. SANDER, ST. ALBAN'S.

AFRICAN TUBEROSES AND LILUM HARRISII,

Grown by WM. RISLEY, Maritzburg, Natal.

THE TRADE AND GROWERS are hereby informed that the reports of this season's growth are of the most hopeful description. The Bulbs promise to be superior to any hitherto offered in the market.

Orders are now being booked freely for delivery in AUGUST and SEPTEMBER, and Buyers are advised to make an early application. Quotations very low. Terms—net cash. For prices and full particulars apply to

WM. G. MAC GREGOR,
17, Fenchurch Street, E.C.

CUTBUSH'S MILL-TRACK MUSHROOM SPAWN.—Too well known to require description. Price 6s. per bushel (12 extra per bushel for package), or 6d. per cake; free by parcel post, 2s.
None genuine unless in sealed packages and printed cultural directions enclosed, with our signature attached.

SATURDAY, AUGUST 7, 1886.

A SEED FARM.

A LARGE party left London on July 21 for Manningtree, for the purpose of visiting the 1500 acres of land devoted by Messrs. Carter partly to agriculture and the growth of seed corn, and partly to horticulture—the "flower farms" including one of the largest seed-growing businesses in England. Horticulturists naturally become somewhat hardened to the wonderful effects of such displays of flowers as only a seed grower can exhibit; but at St. Osyth, where the flower farm extends to 150 acres, the gravity of the veterans fairly failed them. The brilliancy of the colours so surprised a gentleman who is not a horticulturist, and who was paying his first visit to these dazzling fields, that he exclaimed, "Can this be genuine?" He had never moved in such a world before, among colours to whose effect we may apply the words used by Othello in the last sad soliloquy before he kissed and smothered Desdemona—colours so perfect and so bright, that after looking for a short time on the widespread beds of purple, red, blue, white, and other colours, the eyes grow tired and pained—the "sense aches" at the sight. Amid this large display of wonders one can hardly particularise; but the Tom Thumb Tropaeolum originated here, and perhaps among these "little wonders," the greatest wonders in regard to colour and floral display are found. Here is King of Tom Thumbs, a brilliant scarlet, an acre of it all ablaze, and hardly a leaf to be distinguished among the mass of blossom. What a contrast to the unmodified Nasturtium of thirty years ago, which was little better than a tangled jungle of leaves and straggling stems, with a few blossoms here and there.

For several hours the horticulturists were continually being electrified: Ruby King Tom Thumb Tropaeolum, a marvellous purple-red, greatly struck us, and we were struck again with Dunnett's Tom Thumb. An acre and a half of Sweet Alyssum brought us the relief of a sheet of pure white, and a ridiculous black and villanous Potato, introduced from Zululand, and planted here as a foil probably, quite cheered us up.

After so much beauty and perfection it was a relief to meet with something ugly. But more shocking was to follow, for we fell in with the new Eschscholtzias, delicate yellows and several other colours, very superior to the coarse yellow original Eschscholtzia. Also Larkspurs, very Lucking! and the scarce and sweet yellow Lupin, which had a great effect on the most experienced florist of the party, owing to its rarity. He moved on at length, for some one cried "Eccremocarpus!" and there was that handsome creeper growing as a field crop, supported by sticks like a Pea, and blossoming freely. This speaks well for Essex, and for the rich, deep, dry land of St. Osyth.

The Centaureas, the Emperor blue Cornflower, and the pure white, pulled us up for a moment, as did a great number of annuals and other flowers worthy to be named. Pansies and Carnations, Candytuft, Marigold, and

SEEDLING PLANTS OF CHOICE

FLORISTS' FLOWERS, &c.

We have much pleasure in offering strong healthy transplanted seedlings from our superior strains of the following:—

Per doz. Per 100.
CALCEOLARIAS, from choicest flowers .. 1 6 .. 10 6
CARNATIONS and FICOTEEES, from stage flowers, will produce 80 per cent. of fine double blooms .. 1 6 .. 10 6
CARNATIONS, choicest yellow, very fine .. 1 6 .. 10 6
CINERARIAS, from a grand strain .. 2 0 .. 12 6
new dwarf, large flowered, fine .. 1 6 .. 10 6
CYCLAMEN, Strong young plants, first single pots, for blooming next season
CYCLAMEN PERSICUM ALBUM, pure white, very early .. 4 6 .. 30 0
CYCLAMEN PERSICUM, mixed .. 4 6 .. 30 0
PRIMULA, Crimson King, magnificent .. 2 6 .. 10 6
Crimson King, extra strong plants .. 3 6 .. 10 6
Daniels' choicest white, fine .. 1 6 .. 10 6
Daniels' choicest red, splendid .. 1 6 .. 10 6
Daniels' choicest mixed, many beautiful varieties .. 1 6 .. 10 6
Daniels' choicest mixed, extra strong plants .. 2 6 .. 15 0
PANSY, Emperor William, deep ultramarine blue, very fine .. 1 0 .. 7 6
POLYANTHUS, gold-laced, very choice .. 1 0 .. 7 6

WATKINS & SIMPSON,
Seed and Bulb Merchants,
EXETER STREET, STRAND, LONDON, W.C.

Mignonette, Coreopsis, and the rest, common but beautiful. We noticed in passing the curious habit of the *Convolvulus minor*, which turns its blossoms to the south, so that if you sow it outside your windows they should not be on the south side of the house, or the habit of the flower will prove a drawback. But here we are among the *Godetias*, electrified again! They are indeed terribly lovely! The Lady Allendale is one of the most brilliant and full of blossom; and Lady Satin, a rose-coloured *Godetia*, was also much admired. Happily the *Nemophila* was out of blossom, and to that extent we escaped the exhaustion which electric eels are said to feel when the shocking has been too constant and severe.

The care and pains bestowed here are beyond praise. The beds are most carefully "rogued," "Improved" flowers, much mixed in breed, are extremely liable to produce always a few plants which are not true to type, and these are removed with so much care that we scarcely detected a single straggler in a survey extending over several hundred acres.

To this short notice of flowers must be added a word on the several varieties of Wheat which were cross-fertilised at Forest Hill under the supervision of Mr. C. H. Sharman, Messrs. Carter's manager. They present decided novelties, especially the bird-proof Wheat, and one or two very early sorts bred from Talavera. Their reception on the market when offered should be warm. *H. E.*

New Garden Plants.

ODONTOGLOSSUM CRISPUM, *Linl.*

FROM what I have seen Baron Ilrudy's plant comes nearest *Odontoglossum crispum* Veitchianum. It is, no doubt, very grand. Sepals neatly broad, the lateral ones rather long, plicated along the disc with brown, and adorned at the margins with mauve. Petals nearly unequal, triangular, toothed and wavy brown in disc, with mauve marginal decoration. This made its appearance quite of late at Mr. F. Sander's. I believe it is the same plant of which Mr. Sander favoured me with a fine dried wild grown flower. The plant has been exhibited at South Kensington, where it had a certificate. It has to leave England, Baron von Ilrudy having just purchased it at the low figure of 100 guineas. *H. G. Rehb. f.*

CYPRIPEDIUM ORPHANUM, *n. hybr. Angl., Hort. Veitch.*

The leaves are short, remarkably stiff, very shining, not marbled. Perianthe very tall, reddish-brown. Bract exceedingly short. Upper sepal triangular, blunt at the apex, with a dark purple midline, seven green nerves on each side, light purple hue on the margin. Body of upper sepal very short, with ten green nerves. Petals oblong, blunt acute, a little bent down, flat, white, with a deep purple midline, mostly olive-green, spotted at base. Lip very wide, nearly refuse on mouth, purple-brown in front, light sulphur at the back, with numerous purple spots on the base. Staminode with an inflexed tooth on each side and a yellow apiculus in the mid, light purple-brown on each side.

This poor plant has no known parents, it is an orphan. It appeared at the Royal Exotic Nursery of Messrs. J. Veitch & Sons, under Mr. Sden's care. With all deference to this grand establishment we cannot believe in *generatio æquivoca*. Parents must be *Onmescium* or *evn*. But who were the unknown parents? I guess *Cypridium Druryi* and *C. Argus*. The small bract, the small lower sepals, the yellow back of the lip, the deep lines in the middle of the upper sepal and the somewhat deflexed petals speak for *Cypridium Druryi*; as the short leaf, the tall peduncles, the spots of the petals, the staminodes, the upper sepal except the midline, make one think of *Cypridium Argus*. *H. O. Rehb. f.*

A TRIP TO CHIRIQUI.

(Continued from p. 142.)

ON entrance into the river we found it a swift flowing stream some 50 yards in width, its banks on both sides completely covered with a majestic Palm locally known as the "Silicoo." This tree is known to botanists under the name of *Raphia tädigera*, Mart., and according to the authors of *Genera Plantarum* it is the only American species of the genus, the remaining five or six which constitute all at present known, being natives of Tropical Africa and Madagascar.

It is a handsome and noble tree, and appears to exist in the swampy alluvial deposit, which is a characteristic of the district for some miles inland. The large quantity of trees, and their luxuriant growth, without doubt form one of the provisions of Nature for rendering such tracts of country inhabitable for human beings, and probably exert in this their own home an equally beneficial influence on the hygiene of the neighbourhood as do the Eucalyptus and other trees of luxuriant growth, in situations where, from the dampness of the locality, their presence is required to absorb the superabundant moisture.

The leaves alone of those we saw on the Wari-Biara River were fully 50 feet in length and about 6 to 8 feet in width, forming, as Wallace says, "probably the largest-sized leaf in the whole vegetable kingdom."

The tree bears a fruit oval in outline, some 3 inches in length, and 2 inches in diameter, which is covered with regularly imbricated brown polished scales, making it look at first sight more like the fruit of a Coniferous tree than the seed of a Palm. It forms a very pretty ornament to the drawing-room table when fully ripe.

For some two or three miles our route lay through the district on which these trees were growing, but ere we had reached their inland limit we were overtaken by a perfect deluge of rain, which effectually put a stop to our observations for the evening. However, some time after dark we arrived at "Riley's Ranch," a building situated on a Banana plantation, and erected for the convenience and shelter of the labourers engaged thereon. We found this tenanted by numerous Indians and their dogs, but as it was large and fairly water-tight, we soon set to work, slung hammocks, changed clothes, &c., and after a fine brew of steaming hot chocolate, in addition to our substantial meal, we sought repose. We were disturbed at intervals by the barking of the dogs and the demoniac howlings of the baboons in the adjacent woods. At daylight next morning the sky was clear, and we again pursued our journey.

The river was now in high flood, which made it laborious work for the men at the oars, and the hours glided rapidly by, taken up as they were by observations on the many new and exciting objects which momently came into view. Numerous birds were seen, of all sizes and colours, in fact to the sportsman or naturalist, as well as to the botanist, there was plenty of material to occupy their undivided attention.

We had by this time approached "The Rapids," which consisted of deep whirling eddies or pools, interspersed with rocky and shingly shallow banks, over which but little water was running. The deepest part of the shallows were chosen, and the canoe had to be hauled over by ropes provided for the purpose. No sooner were we out of one difficulty than we were into another, the principal danger lying in sunken trees, which in the thick muddy water, caused by the previous day's downpour, were very hard to detect. These were all passed successfully, and we reached Jessy Town at about noon. It was situated at a junction of two rivers, down which a number of Indians had come to meet us. These people were universally short in stature, but very athletic and robust, and appeared to us inoffensive, peaceable, and docile. Both men and women were painted on the cheeks in different patterns, in which squares and diamonds predominated, and done in red and black paint. On enquiry I found that they manufactured the black themselves from a fragrant kind of gum (extracted from one of the native trees) called Pontape, which appeared to resemble the Gum elemi of commerce.

The special tree affording this latter product is a matter of considerable doubt. Grisebach describes it as the produce of a Dominican tree named

Dacryodes hexandra, Gr., while other authors give it as being obtained from *Myrsin balsamifera*, L., and allied species.

If the gum should prove to be produced by any of the Jamaican trees, it will add another to the list of "minor products" which are in process of development, and inquires into the subject, in the interest of cultivators generally, will not be lost sight of. There are three species of *Myrsin* indigenous to Jamaica, while a fourth, native of Cuba and Trinidad, belongs also to the locality of which we write.

It readily ignites, and burns freely, producing quantities of black smoke, which deposit a very pure kind of lamp-black, which is the substance used. Red ochre is purchased at the stores by the Indians when they come down to the settlements to barter or trade for clothing and other necessaries, and forms the contrasting colour with which the face is ornamented. The colours are mixed with fat, and we were informed that the article most preferred was obtained from cockroaches! That abundance of these pests existed everywhere of a very large size we were well satisfied, but the statement as to the use of their fat was taken *cum grano salis*.

The mission-house was a large building, constructed solely by the Indians for the use of the mission parties who visit them regularly once a month, and was constructed solely of the products of the various Palms so abundant in the neighbourhood. We took up our quarters therein, and found it airy and comfortable. The Indians usually sleep upon the ground, the bed being made of the leaves of a plant known as the Pimento Palm, *Acanthorhiza aculeata*. The leaves are fan-shaped, and when tied two together in opposite positions they form an efficient shelter from the rain, for which purpose they are used by the Indians, as well as for beds and thatching purposes.

Again the inevitable dog was present, and I witnessed a curious instance of the affection of these people for the canine race. They use, for carrying their children, goods, and effects, strong nets made of the fibre from the leaves of *Bromelia pita*, or Silk-grass; and on examining one of these bags hanging up near the kitchen I found to my surprise a litter of young pups about three or four days old, which had, I learnt, been brought by one of the boys a distance of several miles.

Around the mission house on all sides were growing large quantities of several species of dwarf Palms, mostly belonging to the genera *Chamædorea* and *Geonoma*; among the latter was a very beautiful species with a thick plumose head of irregularly pinnate leaves, which were bifid at the apex. There were also large quantities of several different *Heliconias* and other genera of the order Scitamineæ. One of these, locally known as "Waaha," struck our attention by the presence of a silvery glaucous tint on the underside of its leaves, which when swaying with the wind gave the plant a most peculiar appearance. It is nearly allied to our Jamaica plant (*Heliconia hibid*, the wild Plantain), but it is probably a different species. Its leaves are used for thatching temporary dwellings, and for tying up the food of the Indians.

Maize is grown as one of the principal food supplies. It is very prolific, and ripens at several periods of the year. It has apparently been from the most ancient times the principal food of the inhabitants of Central America. On the coast of Peru, Darwin found heads of it, along with eighteen recent species of marine shells, in a raised beach 85 feet above the level of the sea; and in the same country it has been found in tombs apparently more ancient than the times of the Incas. "In Mexico it was known from the earliest time of which we have any record, in the picture writings of the Toltecs, and that ancient people carried it with them in all their wanderings.

"In Central America the stone grinders with which they bruised it down are almost invariably found in the ancient graves, having been buried with the ashes of the dead as an indispensable article of outfit for another world."

The method of bruising the Maize in general use among the Indians of the district is to simply bruise the Maize without any previous boiling, and then to tie it up tightly in the leaves of the "Waaha" and boil it until it becomes a solid and somewhat glutinous mass, which is then carried with them on their journeys, and it is eaten cold, or warmed up by another slight boiling. It is therefore probable that the Mexican method of preparing the grain into cakes called tortillas, though stated by Belt to be common

to Central America, did not in reality extend so far south as the province of Veragua. I saw some of it in the hands of the Indians, but to me it did not look particularly inviting, as the outer skin of the grain rendered it to all appearance somewhat chafy.

On the banks of the river and in the adjoining forests were seen several trees of *Castilloa elastica*, from which is produced the Central American rubber, but they were all young trees, and in consequence were not bearing any seeds. All the larger trees have been destroyed by the rubber gatherers, and it is only in localities several days' journey farther inland that any trees exist of sufficient size to produce rubber in any quantity. These localities are kept secret by the Spanish and Indian section of the community, so as to prevent encroachment upon what they deem to be their exclusive right to cut and manufacture the article. These people bring down in their canoes during the season large quantities of rubber, which is bartered for clothing and provisions at the coast settlements. There are two classes of rubber, the flat or cake manufactured rubber, and the scrap rubber, which I was informed is collected, when congealed, in the incisions made for bleeding the trees at the commencement of the season.

When the locality in which these trees thrive is compared with the climate and soil of Jamaica, it would appear to be doubtful if this rubber-producing tree could ever be successfully cultivated on a commercial scale in this island except in the moist and humid situations, but nevertheless, it should be given, and is well worthy of an exhaustive trial, as the vagaries of plants are of such an arbitrary character, that by this means alone can their capabilities be discovered. *F. Hart, Jamaica.*

(To be continued.)

PLANT ILLUSTRATIONS AT THE COLONIAL EXHIBITION.

NOR the least interesting and instructive part of the Exhibition is that of the numerous illustrations of flowers and fruit, representing the flora and economic fruit products of India and the Colonies. The paintings of fruit are generally well executed, and must serve greatly to familiarise visitors with what was recently described at a conference on the waste products of the tropics. If they do not accustom one to the peculiar flavour of the numerous and varied fruits in question they certainly pave the way for their reception in this country on a more extensive scale than they have hitherto been. The naming of the plants illustrated, although not altogether faultless, is tolerably correct. The Nutmeg, however, with its highly coloured lacerated aril, is misnamed Pimento, which is a much smaller fruit and a member of the Myrtle family.

Amongst the illustrations of Himalayan plants are figures representing male and female flowers of that singular *Cucurbit*, *Hodgsonia heterocolla*, whose stems form slender woody lianas climbing over trees to the height of 100 feet. The long, pendulous, spirally twisted segments or fringes of the corolla are very singular, but not more so than the Melon-like fruit, whose seeds measure about 3 inches long and 2 broad. The latter consists really of two collateral ovules, firmly united and inseparable, one of which when mature is always small and more or less completely aborted. A living specimen which has not yet flowered may be seen in the Victoria-house at Kew. A singular *Nymphaea*, with petals fringed like a *Trichosanthes*, and representing the Bombay flora, is named *N. fibriata*. Its most striking peculiarity is that the leaves are proliferous at the base of the blade, and bear not only small leaves but also flowers. A handsome *Buddleia*, named *B. Colvillei*, and growing at elevations ranging from 9000 to 12,000 feet, has apparently not yet been introduced to this country. The same remarks apply to *Pentapterygium salignum*, a handsome species, represented in the same plate as *P. serpens*, which flowers annually at Kew.

In examining the illustrations of New Zealand plants, amongst little known species characteristic of the vegetation of that part of the world, one is agreeably surprised to find numerous instances of such familiar greenhouse plants as *Veronica salicifolia*, *V. speciosa*, and *V. Hulkeana*, besides numerous instances of shrubby Composites, whose cultivation is frequently attempted in the open air in this country in sheltered places or nailed to a wall. *Rubus australis*, as seen in

this country, is remarkable for the great reduction in the size of its leaflets, when the naked spiny petioles and branches become the most conspicuous feature of the plant. In the present instance, however, the leaflets are of considerable size and borne on much shorter petioles than are those of the reduced form. The inflorescence is paniced, consisting of numerous small white flowers with red stamens, bearing no inconsiderable resemblance to that of the Hawthorn. Although attaining a height of 6 or 8 feet on a wall in the open air in this country, it does not seem to flower.

The Australian flora is well represented by a series of large paintings high above the eye of visitors on the walls of the building. One decided drawback for English visitors in connection with these is the fact that native names only are used, while in some cases no name is given at all. Those familiar with conservatory plants could easily recognise the affinities of most of the representations, but the native name would frequently be no clue to determine the species. A noticeable feature is the frequent occurrence of members of the great Pea, Myrtle, and Protead families. *Sturt's Glory Pea*, *Clianthus Dampieri*, with its great scarlet flowers and jet-black boss, will always command attention, whether as a picture or living flowering specimens. A fine example has been flowering for some weeks past in the Cape-house at Kew. Another strikingly conspicuous picture is a painting of *Telopea speciosissima*, simply named *Waratah*. A landscape painting in another part of the building exhibits a hillside bordering a gorge, covered with *Waratah* bushes whose large heads of aggregated scarlet bracts and flowers, give the scenery their own tone of colour. This magnificent Protead is sometimes, though too seldom, grown as a conservatory plant in this country. *J. F.*

PINKS AND PINK CULTURE.

SOME of the most reliable illustrations of the Florists' Pinks I can find are those which appear in the *Florists' Magazine* for 1835-36. The illustrations are full-sized, and I should think faithfully executed; they represent full, well laced examples. One named *Princess Victoria*, raised by one John Dalton, of Mitcham, and sent out by Mr. Woodman, Manor Place, Walworth, no doubt illustrated one of the very best varieties in cultivation in that day; and the petals have little of the serrated edge seen in those of a companion in variety, named *Sir Walter Scott*, raised by William Stockwell, of Walworth Common. The last evidently had the better and darker lacing; the former the smoothest petal edge, the latter being much fringed. They serve to make us acquainted with the varieties grown half a century ago, and undoubtedly since that time we have greatly advanced in regard to purity of the ground, definiteness and density of the marking, shape of petal, and smoothness of the edge. The growth in the interim may have been slow, but it has surely been certain.

Maddock, in his *Florists' Directory*, published in 1792, informs us that "a Pink called Major's Lady Stoverdale, raised from seed in the southern parts of England by the person whose name it bears, was the first that deserved to be classed among such as are now held in esteem by florists; it was raised about twenty years since, and was the first Pink possessed of that singular and beautiful ornament called a lacing, which is a continuation of the colour of the eye, round the white or broad part of the petal, that gives it a most elegant appearance." From the appearance of Major's flower to that of *Princess*, we get an interval of sixty years or so, and we can thus get some idea of the progress made in that time.

That the Pink has suffered from something like neglect during the past twenty years cannot be denied; and yet it is such a thoroughly hardy plant, so easily grown, so free and richly fragrant, and so delightful to cut from, that one wonders it is not more frequently grown. It finds a place in many schedules of prizes of flower shows held in the midland districts; and many a select collection is grown to furnish exhibition blooms, and new varieties are being raised also. One of the foremost raisers and cultivators in the present day is Mr. James Thurstan, of Merrivale, Wolverhampton, who has grown Pinks for thirty years past, and during the last fifteen or sixteen years raised some varieties of great merit. Having recently seen these growing in his garden at Wolverhampton, I am able to furnish some descriptive notes of them. They are as follows:—

Dr. Hardy, pure ground, edged with bright dark maroon; a fine lacing, distinct and regular, smooth at the edges, a fine full flower; this was raised in 1881. Mrs. Morton is a highly finished flower that bloomed first in 1885, bright maroon, lacing of medium density, beautifully marked, of good substance, very smooth on the edge and highly refined; an extra fine flower. Mars is also a flower of 1885; pure ground, very heavily laced with dark purple, petals finely formed and smooth, plenty of stuff, about thirty petals; extra fine. Mrs. Houlgave was raised in 1881, pure white ground, rather long petals, bright rosy-crimson lacing laid on somewhat heavily, but always regularly; fine and bold. William Bolton was raised the same year; pure ground laced with dark maroon, good to the centre of the flower; a very full and bold flower. James Thurstan was raised in 1884, and is a large and striking flower full of petals, pure ground, heavily laced with bright velvety maroon, and wire edge of white; perfectly smooth and of the best quality. Samuel Barlow is an 1834 flower, a large and noble bloom, raised in all probability from Boiard; pure ground, dark maroon lacing, with slight margin of white on the edge of the petals; the flower is full of perfectly shaped petals, and it is decidedly of high-class quality. Lord Beaconsfield is one of the 1881 flowers, a large and full flower, pure ground, heavily laced with bright red; a variety showing much refinement of character. John Dorrington first bloomed in 1884; it has fine bold petals with medium lacing of bright rosy-purple; it is of first rate quality and characterised by much refinement of character. Helen Maud, another of the same year, is a variety containing on an average twenty-five petals, which is quite enough to form a good show flower; the lacing is bright maroon on a pure white ground; well formed smooth petals, of a pure white ground. Clara is also a flower of 1884, and has finely shaped petals laced with light purplish-maroon with a wire edge of white; very pleasing indeed. Mrs. Haynes, which first bloomed in 1880, has a beautiful petal with bright red lacing perfectly distributed on the pure white petals—a charming variety. Rose Elizabeth is of the same batch, and has a beautiful petal with a lively rosy-lilac lacing; very distinct and pleasing. F. D. Horner flowered for the first time this year; it is a very full flower of from thirty to forty petals, good habit, appearing to be a very strong grower; handsomely laced with bright crimson-magenta on a pure ground; being the first bloom the petals were small, but it is a variety full of promise. George Hodgkinson first bloom d as far back as 1872, and was a seedling from an old flower named *Battersby's Emily*, but of a much more refined character, smooth on the edge, with a rich dark lacing, almost black, on a very pure white ground. Mrs. Thurstan was raised in 1870; it is a seedling from Mr. Todd, which was a renowned flower in its day; Mrs. Thurstan is a flower of some thing like twenty-five perfect petals, the petals pure, with a distinct wire edge of bright maroon; a refined and charming flower, sent out by Clibran of Altrincham about 1871. Florence Isabel is a seedling of 1884, with medium bright maroon lacing; very full of petals, small, but correctly marked; and Nellie is of the same date—the well formed rare petals laced with light rose, very pretty and distinct. All the foregoing are of good habit, free, and characterised by much smoothness of edge and refinement of marking.

The cultivation of the Pink is a simple process, for the plant is perfectly hardy and requires no coddling. It does best in a good strong loam enriched with old hotbed manure, and in the months of March and April, for the purpose of bringing out the most distinct colouring on the lacing, it is essential that the bed should be top-dressed, and the best dressing that Mr. Thurstan finds he can use after thirty years' experience is human manure from an old-fashioned closet diluted with water until it is about the thickness of gruel, and a half pint of this is poured round each plant about twice or thrice a week. This is put on overnight, so that any disagreeable smell may disperse before the morning. Mr. Thurstan finds this an excellent manure for *Tulips* and other things. The late Dr. Hardy, old William Lea, and others, used this for top-dressing.

Mr. Thurstan propagates his Pinks by means of pipings about the middle of July; a little later perhaps than it is done in the South, allowance being made for difference in the time of flowering. If the work is delayed beyond the time named the risk

shoots or "grass" run into blooming stems. Before taking his pipings Mr. Thurstan prepares a piece of ground in a shady situation, and mixes with it a good dressing of decayed manure and sand—road sand is found to be the best; after being thoroughly mixed it is saturated with water, and then allowed to drain for an hour or so; then a layer of pure sand half an inch in thickness is placed over the surface; this being done, the pipings are prepared by being cut through just below a joint; then put into the led's in circles, pretty close together, and just large enough to be covered with bell-glasses. The pipings are pressed firmly into the soil, and by placing bell-glasses over them they are encouraged to strike roots. It is best to make a mark on the soil with the bell-glass, and then fill up the space with pipings, putting them in about an inch deep. A circle of 6 inches in diameter will take about thirty pipings. After they are inserted in the soil they are watered and allowed to stand uncovered for about an hour, by which time they will be dry enough to cover with the bell-glass. The bell-glasses are not removed for a fortnight or three weeks, by which time the pipings have begun to form roots; when they are taken off, and the pipings refreshed by means of a sprinkle with water, after which the glasses are again replaced. At this stage a little water is given day by day until the pipings are so rooted that they can be lifted and removed to prepared beds for permanent blooming. This is done early in October, so that the plants may have time to root into the soil before the winter sets in. Mr. Thurstan finds by experience that if the plants are not placed in the blooming beds in autumn, but this is left until the spring, the lacing is not reliable, and it is difficult to get the blooms to anything like a perfect stage.

In raising Pinks from seed Mr. Thurstan sows in February either in a prepared bed in the open ground or under bell-glasses. By sowing under bell-glasses the seed germinates more quickly, and the plants get through the soil before the drying winds of March set in. The seedlings are planted out in a prepared bed in autumn to flower, and when they flower selected varieties are marked and propagated in the manner set forth above. *R. D.*

ACORN GALLS.

I HAVE to thank Mr. William Marshall for three "Acorns from Cannes," sent to the Editor of the *Gardeners' Chronicle*, and by him forwarded to me to report upon.

Mr. Marshall's niece says:—"I cannot say for certain if they are from the same tree as the one with the galls, as I picked some up in two places, but the trees were not far apart, and were in the same garden. I did not see the cups. The Acorn with the galls was considerably larger than those I now send, but of the same shape. I saw no others as large. I did not notice the size of the tree."

The three Acorns sent, as far as I can judge, belong to *Quercus Kobur*, the common English Oak. Those of *Q. Cerris*, the Turkey or mossy-cupped Oak, have a less shining shell, and after a careful comparison I can scarcely hesitate to refer them to the former species. Two of them are quite normal in size and shape, but the third is a little smaller, decidedly curved, and somewhat discoloured and broken on the shorter side, through some damage during growth. This Acorn, however, and one other, contains no trace of galls. The third Acorn, on the shell being removed, showed a small hole, a millimetre in diameter, the edges of the hole being slightly forced outwards, and the apex of a small gall just protruding. On carefully cutting away the Acorn tissue on one side of the gall, the latter was seen to be enclosed in a smooth-walled chamber; the walls being slightly darker coloured than the Acorn shell, and tightly embracing the gall, as if the cavity had been made by pressure caused by the gall's growth. The gall itself is bluntly conical in shape, and measures 4 millimetres, or nearly a sixth of an inch, in length, and 2 millimetres in breadth at the almost truncate base. From this point it gradually narrows to 1 millimetre near the apex, and then terminates in a roundish blunt point. The lower half of the gall is drab, or slightly ochreous in colour, and the upper half warm chestnut-brown, the boundary of the two colours being rather sharply defined. The interior of the gall I cannot describe, as being the only specimen I prefer to keep it intact in the hope of breeding the insect.

I have given the particulars rather fully, because it is clear that more than one insect is concerned in the making of these Acorn-galls, and also with the hope that the attention of others may be drawn to this interesting subject, and thus perhaps help to clear the matter up. I have cut through numbers of English Acorns at various times without finding galls, though we have them in Britain, as shown in my previous paper (p. 104).

In conclusion, the differences of the Turkey Oak Acorn-gall, as observed by me at Kew, may be pointed out. Each autumn for several years past these galls have been abundant on more than one tree; so much so that very few Acorns mature; and the galled ones are very few and dwarfed, while the Acorn tissue is entirely replaced by a number of the galls. They also remain on the tree for some time after the uninjured Acorns have fallen, and, unlike these latter, the cup and Acorn fall away together, the Acorn seldom being much larger than the cavity of the Acorn-cup. The differences between the two are so marked as to leave no doubt of their being produced by different insects, and the one thing now necessary is to obtain more specimens of the *Robur* gall, and if possible breed the insect. *R. A. Rolfe, Herbarium, Kew.*

CENTAUREA MACROCEPHALA.

To Mr. George Paul we are indebted for a specimen of this sturdy hardy perennial (fig. 30). Its stout erect stems are about 18 inches high, provided with lanceolate decurrent leaves, rough with coarse bristles, and bearing at the top a globose head of yellow flowers, like a small Globe Artichoke, are very striking. The involucre bracts are numerous, densely packed in overlapping series, and each one ends in a broad suborbicular brown membranous and sharply laciniate appendage. It is a native of the Caucasus, and attains in cultivation a larger size than when wild, as according to Boissier, *Floa Orientalis*, iii. (1875), 632, the flower-heads are no bigger than a fowl's egg. There seems no reason why the receptacle should not be cooked and eaten, like the bottoms of ordinary Artichokes.

A REVISION OF THE GENUS PHALÆNOPSIS.

We have now over forty named forms of this beautiful genus of Orchids, most of them being in cultivation at the present time, but as the literature respecting them is rather scattered, and as we have had no general revision since 1874, it is my intention to gather together into one focus such information as I have been able to collect and to give an enumeration of the species, together with references to the more important descriptions and figures, the geographical distribution, and the general history of the genus. The revision above referred to is that of the illustrious Professor Reichenbach, in the second volume of his *Venia Orchidacea*. Eleven forms were then enumerated, though more than eleven had been described at that date. As the number has now been more than trebled I hope this attempt to bring our knowledge down to the present time will be found useful to all those interested in these lovely plants—"the grandest of all Orchids," to quote the late Dr. Lindley.

GENERAL HISTORY.

Rumphius appears to have discovered and published the first account of a species of this genus in 1750. In the sixth volume of his *Herbarium Amboinense*, he gives a description and figure of a plant which he called "*Angræcum album majus*." This plant he found growing in the island of Amboyna, on short thick trees covered with moss, up which, he says, it turns like a rope, and from which it hangs down in entangled tufts.

Two years later it was discovered near the watering place on New Island, at the western extremity of Java, by Osbeck, who touched there on his voyage home from China. Specimens preserved by him were forwarded to Linnæus, who described the plant in the first edition of his famous *Species Plantarum* as *Epidendrum amabile*. The work appeared in 1753, and it should be remembered that the small number of epiphytic Orchids known to Linnæus were all included in his genus *Epidendrum*—the name then being singularly appropriate and descriptive.

HOW OSBECK FOUND THE PLANT.

Osbeck's account of the plant and its discovery is of such interest that the substance is worth reproducing. In his *Voyage to China and the East Indies* (English edition, vol. ii., p. 50), he remarks somewhat as follows:—"On January 19, 1752, we anchored at noon in the New Bay, at the western extremity of Java. In the afternoon we went on shore in a boat. We landed with difficulty, because the ground was so full of corals that it was impossible to reach the beach in the boat, and I was carried on shore by my people on their shoulders, up to their breasts in water. The country here is very high, and the water which comes hither from the fens in the woods runs roaring into the sea. The forest was so dense that we passed with difficulty, and being the rainy season everything was very wet. The trees are excessively high and slender, making the forest very dark. *Epidendrum amabile* grew on the branches of trees on the shore. The plant hath great white odoriferous flowers, such as I never observed before. I had this plant lying in my room for some days together, but the flowers did not water, and filled it with the most agreeable smell." It is interesting to note that Osbeck's specimens still exist in the Linnean Herbarium in an excellent state of preservation.

In 1799 Swartz published a memoir on the genus *Epidendrum* of Linnæus, breaking it up into six genera; and although he pointed out that Osbeck's plant differed from *Epidendrum* by the want of cohesion between the column and the base of the lip, still he allowed it to remain where Linnæus had placed it. Roxburgh, however, who knew the living plant, transferred it to Swartz's genus *Cymbidium*, to which it is much more nearly allied. He tells us the plant is a native of the Moluccas, whence it was introduced in 1798 to the East Indian Company's Botanic Garden at Calcutta; that it flowered in March and April, and that the flowers were very large, white, and fragrant. Roxburgh's *Flora Indica* was probably written before 1820—he died in 1822; but the volume in which this change was made did not appear until 1832.

Again we hear of it from Java. Dr. Horsfield found it in 1809, in one locality only, in the district of Padjjitan, in a low situation near the southern coast of the island, and at no great distance from the ocean. Then Dr. Blume observed it in woods near the coast in the small island of Nusa Kambangan. The latter published his *Bijdragen*, in 1825, and established a new genus for the plant, which he called *Phalænopsis*, on account of a fancied resemblance to certain species of moths. He also gave an excellent analysis of the flower.

THE FIRST PHALÆNOPSIS IN CULTIVATION.

When Lindley published his *Genera and Species of Orchidaceæ* in 1833, the genus was not in cultivation in England, and his description was wholly derived from the aforementioned sources. But in 1838 we find a *Phalænopsis* in cultivation in this country. Dr. Lindley figured in the *Botanical Register* a plant which he called *P. amabilis*, but which was really not that plant. Dr. Lindley remarks:—"This very rare and beautiful epiphyte flowered a few weeks since in the epiphyte-house of Messrs. Rolleston, of Tooting, I believe for the first time in Europe. It had been sent to them from Manila, by Mr. Cuming." This mistake of Lindley's was an unfortunate one, for the Philippine plant still bears the name *amabilis* in gardens.

In 1840 the Philippine plant was figured in *Paxton's Magazine of Botany*, whence we learn that "Among the many subscribers to the expedition of Mr. Hugh Cuming in quest of botanical curiosities, Messrs. Rolleston, of Tooting, were alone fortunate enough to receive a living specimen of this lovely plant . . . in 1837." This figure of Paxton's was reproduced in the *Flore des Serres* five years later, but the figures and localities of both species were all confused together in the accompanying description. In 1847 it was figured in the *Botanical Magazine*, the error still remaining undetected.

The Javan plant was again figured by Bennett in 1838, in his *Planta Javae rarioris*, the author pointing out that it appeared to refer to the immediate vicinity of the coast, and had been found in several localities in Java, as well as in the Moluccas. At length it was brought alive to England, nearly a century after its original discovery, and ten years later than the Philippine species. On September 7, 1847, a plant was exhibited before the Horticultural Society by H.

Schröder, Esq., when it received the Silver Banksian Medal. At that time it was regarded merely as a fine variety of the Manilla plant. In the *Gardeners' Chronicle*, however, for the following year, a woodcut of each species was given, Dr. Lindley remarking that there were so many points of difference between the two as to leave no doubt of their distinctness; but, strange to say, though Lindley informs us that the large-flowered plant had been introduced from Java

A PINK BUTTERFLY FLOWER.

A third species was described in 1848 as "*P. rosea*, the Pink Butterfly-flower." It was found at Manilla by Mr. T. Lobb, who sent it to the Messrs. Veitch. Dr. Lindley remarked:—"This is a very unexpected addition to the genus *Phalenopsis*, of which it has exactly the habit." It had previously been found by Cuming; but though he secured dried specimens he seems to have failed to send plants

proved correct. The plant which flowered some three months ago in the establishment of Messrs. Veitch, and which is exactly identical with the wild intermediate, was obtained by Mr. Seden, by fertilising *P. amabilis* (of Lindley) with the pollen of *P. rosea*.

In 1854 a fifth species (*P. deliciosa*) appeared. It was described from dried Javan specimens, but I do not think it has ever appeared in cultivation.

In 1850 some additional species were described.

FIG. 30.—CENTAUREA MACROCEPHALA: FLOWERS BRIGHT YELLOW. (SEE P. 168.)

by Messrs. Veitch, he did not even then recognise it as the original species of Blume (which he had correctly described in his *Genera and Species of Orchidaceae*), but described it afresh under the name *P. grandiflora*; he even thought Bennett's figure might represent yet another species.

Dr. Reichenbach pointed out this confusion in 1862 in the *Hamburger Gartenzetung*, and renamed the Manilla plant, *P. Aproridite*, but Lindley's names are still used in gardens. In the following enumeration the name *amabilis* is retained for the original plant in accordance with the recognised rules of priority.

home alive. Meyen had also collected it at the same time, and a new genus (*Stauroglottis*) had been founded for it by Schauer in 1843.

In 1852 *P. intermedia* was described in *Lindley and Paxton's Flower Garden*. It was introduced by Messrs. Veitch & Sons from the Philippines. Dr. Lindley remarked:—"It is not improbable that this beautiful plant is a natural hybrid between *P. amabilis* and *rosea*. It agrees with the former in foliage, and in the tendrils of the lip, with the latter in colour, in the acuteness of the petals, and in the peculiar form of the middle lobe of the lip." It is interesting to note that this shrewd guess of Dr. Lindley's has

The beautiful *P. Schilleriana* flowered for the first time in Europe in the collection of Mr. Consul Schiller, of Hamburg. That gentleman had obtained it two years previously from Manilla, one plant alone surviving out of thirty which had been forwarded. A Javan plant which had been described in 1827 as *Polychilus cornu-cervi*, was also reduced to *Phalenopsis*, and two other species were described from drawings; *P. Devriesiana*, from a drawing made by De Vriese in Java; and *P. sumatrana*, from one made by Korthals in Sumatra. The latter soon afterwards appeared in cultivation, but of *P. Devriesiana* nothing further appears to be known.

The following year has only one species to record—*Trichoglottis pallens* of Lindley, was transferred to *Phalaenopsis* by Dr. Reichenbach. It is a native of Manila. Dr. Lindley saw it in flower at Chatsworth in 1850, but it does not appear to be in cultivation at the present time.

Ten species were now known, but in 1862 four additions were made; one of them, however, not being really distinct. They were described by Professor Reichenbach—*P. Hebe*, from Java; *P. Lowii*, from Borneo; *P. Wightii*, from India (which, however, is now referred by Benham to *Doritis*), and *P. ambigua*. This latter was said to have the flowers of *amabilis* (Aphrodite) and leaves of *grandiflora*, and was thought possibly a hybrid between the two. But this is most improbable, for the two species do not grow together, and if not a natural hybrid it clearly did not originate in a garden. It is evidently a form of *P. Aphrodite*, with leaves somewhat longer than usual.

In 1864 two additions were made. *P. pantheina*, a pretty species with red spots on a yellow ground, was described by Professor Reichenbach in the *Potanieische Zeitung*. It was obtained by Messrs. Low from Borneo, but the plant appears to have been lost. The description was made from a dried specimen. The other was described in the *Proceedings of the Royal Horticultural Society* as *P. Kuckeri*, and was said to come from Borneo. It, however, proved to be only a very beautiful variety of *P. grandiflora*.

In 1865 three more species were described, the beautiful *P. Luddemanniana* from the Philippines; the curious little *P. Parishii*, from Burma; and *P. amethystina* from the Sondaic Islands, a somewhat vague locality by the way. In 1871, *P. Manni* was described from Assam, and in the following year *P. Veitchiana*, from the Philippines. The latter was supposed to be a natural hybrid; and a single specimen only was known. In 1874, Dr. Reichenbach gave a monograph in the 21 volume of his *Novis Orchidaceae*, eleven species only were enumerated, though, as we have already seen, more than this number were known. In the same year *P. fucata*, from the Malay peninsula, and *P. Esmeralda* from Cochin China, were also described. In 1875, *P. leucorhoda* and *P. casta* appeared, both from the Philippines, and only varieties of *P. Aphrodite*. Then came *P. Soubartiana* in 1877, and *P. antennifera* and *P. Corningiana* in 1879; the locality of *P. antennifera*, namely Burma, alone being published.

We have now a swarm of additions to record—eleven in three years. In 1880, *P. tetraspis* and *P. speciosa* were described from the Andaman Islands; and in 1881, *P. Suartiana* from the Philippines, and *P. maculata* from Borneo. In 1882 appeared *P. delicata* from some unpublished locality, *P. Mariee* from Borneo, and *P. fasciata* from the Philippines. *P. delicata*, however, is so similar to *P. intermedia*, that we may fairly assume it to be a Philippine plant also. Lastly, in 1883 four additional species were described; *P. Valenti* and *P. Reichenbachiana* from unpublished localities, and *P. Boxalli* and *Suartiana* from the Philippines. The last-named, however, which was found in South Mindanao, is clearly only a form of *P. Aphrodite*. So much for the general history of the genus, but before proceeding to enumerate the species a few words may be interesting on the subject of

GEOGRAPHICAL DISTRIBUTION.

The genus *Phalaenopsis* occurs over an area reaching from Assam and the Eastern Himalaya to Burma, the Andaman Islands, and through the Indian Archipelago to the Moluccas and Philippines. The section *Euphalenopsis* is limited to the Philippines, with the exception of the original *P. amabilis* of Blume (*P. grandiflora*, Linl.), which occurs in Java, Borneo, Celebes, and the Moluccas. The section *Proboiscoides* consists of a single species found in Borneo and Moulmein. The section *Esmeralda* contains two species, and is confined to the Siamese peninsula, including Burma. Lastly, the section *Stauroglottis* occurs over the whole area of the genus, with the exception of the Moluccas. Glancing at the different countries we note the Philippines as the area most numerous in species. All the eleven forms are endemic, though probably one or two of them are not specifically distinct. Borneo comes next with six species, three of which are not known from elsewhere. Java has five species, of which three or four are perhaps endemic. Two species are only known from the Andaman Islands. Sumatra has two species,

and the Moluccas one, but none of them are endemic. One species is only known from Assam, one from the Malay peninsula, while four or five others are found in that region, which comprises Burma and Cochin China, one of which extends its range to the Eastern Himalaya, and another is found also in Borneo. Lastly, there are five species of which I do not find a published record of locality. The foregoing sketch will doubtless require modification as further information comes to hand. Possibly some of the occurrences with garden Orchids. On the other hand the broad fact remains that most of the species have a rather restricted area—a fact quite in harmony with our knowledge of the distribution of Orchids generally. *R. A. Rolfe, Herbarium, Royal Gardens, Kew.*

(To be continued.)

THE POTATO CROP OF 1886. SCOTLAND.

ABERDEEN.—Potatoes in gardens are doing well and promise a large crop, but are very late. Only the very earliest sorts are fit for use. All are very healthy, except in exposed situations, where they have been a good deal broken down by the gales of wind we have had recently. *J. Forrest, Halko House.*

— I hear complaints of some having suffered from frost during this month, but with me all is safe, but upon the whole from ten to fifteen days later than usual, and out of some seventy sorts all are healthy and vigorous. I have not heard or seen anything of disease. I have been using Sharpe's Victor, from under glass, for about six weeks, of excellent quality. They are now large from the open ground but not so many. *R. Fairbairn, Fyvie Castle.*

BANFERSHIRE.—Potatoes are everywhere in this locality looking strong and healthy, but a little later than usual for the period. Hammersmith kidneys, which we have been using, are fair in size, and of good quality. *John Webster, Gordon Castle Gardens.*

FORFARSHIRE.—Some fields in the low cause, as well as in the braes, are looking uncommonly well, especially where early planted. Later ones are not quite so strong, but with the recent refreshing showers and warm weather they have greatly improved, and we have no doubt if favourable weather continues, Potatoes will be an average, if not an extra crop. We think if the fruit was getting the same attention as to cleaning, digging, and manuring that Potatoes get in this district, a better result would be obtained. *Carse of Gevie.*

— The Potato crops are looking well in this neighbourhood. In dry sandy ground along the sea-coast they were beginning to suffer for want of rain, but lately there have been several genial showers and one whole night of rain. Now it is, and has been, brilliant sunshine, a clear bracing atmosphere, no thunder nor lightning, and no need for it, the wind mostly in the north and north-west; as long as that is the case there will be no Potato disease. It could not live. *J. Mitchell, Panmure, Carnoustie.*

INVERNESS-SHIRE.—The Potato crop is very promising. Stems and tubers are quite free from any symptoms of disease. Of kinds, Sutton's and Regent Victoria have rather excessive shoots and foliage, which retard the growth of the tubers. Taylor's Fortifield and Champions developed to their normal size. Other kinds are looking equally well. On the whole the Potato crop in the garden and district is the most promising I have seen for a long period of years. *A. MacDonell, Balmacraan Gardens, Inverness.*

ROSS-SHIRE.—The Potato crop very promising indeed, but in some places slightly touched by frost last week. *D. Harvey, Invergordon Castle, July 15.*

STIRLINGSHIRE.—In the garden, Potatoes are all looking exceedingly well. We planted Sutton's First and Best on April 16, and dug fair-sized Potatoes the first week in July; and in this locality generally field Potatoes are all very good; during the past fortnight's fine weather they have immensely improved. We are now greatly in want of rain. *J. King, Blair Drummond Gardens.*

EAST LoTHIAN.—Early Potatoes in the garden this year have ripened prematurely, owing to the long drought, consequently they are small and waxy. The old Ashleaf that we are lifting are a good crop, and free of disease. Late varieties, both in field and garden, look well at present, but will be small too, unless rain come soon. Everything is nearly three

weeks later than usual in this district. *L. Dou, Newbyth, Prestonkirke.*

AYRSHIRE.—Early Potatoes are very good, and heavy crop; late sorts look remarkably well. The soil here suits Potatoes, being light and sandy. No sign of disease as yet. *W. Priest, Eglington, Irvine.*

WALES.

CARMARTHENSHIRE.—As a rule, around here the Potato crops are looking well, and lifting clean and free from disease; so much so, that we have not come on any up to the present time, nor are the tops showing any signs. Field Potatoes are looking well, being clean and free in their growth, without showing any signs of disease or unhealthy growths. *L. Bowen, Edwinsford, Llanilo, July 15.*

PEMBROKESHIRE.—The early crops are not up to the average, as we have had a rather wet, cold spring. The second crops are turning out well; good crops, and clean, and late crops are looking well; no signs of the disease yet: we generally get it before this time in this district. *G. Griffin, Slebeck Park Gardens, Haverfordwest.*

DENBIGHSHIRE.—The Potato crops came up very tardily and very irregular, and just before the dry weather came, some sorts looked as if they would sicken and die off—many plants did, especially of the variety Chiswick Favourite. Early sorts are yielding well—fair quality, but small. The haulms are smaller than usual, but more floriferous, and as yet no sign of the Peronospora. All vegetables have been difficult to get forward. Inside sowing and transplanting have been our chief resources. French Beans have come up simply to be starved. Forced sowings of Peas are doing well. Onions came up well, but the continual cold rain and hail made the drills very ragged, and some sorts are killed, and transplanting by wholesale is necessary. The plague of slugs has been extraordinary, and really defied both salt and lime. Birds are very prolific and numerous. Late broods make the parent birds very voracious; their insect food and worms being rather scarce, they are eating up everything in the shape of fruit, seed, and vegetables. Really the difficulties of the garden on cold soils this year are exceptional. *P. Alderton, Wynnstay, Rhuddlan, Denbigh.*

— Earlyies were fully ten days later than last year, and are not up to the usual average, being small, and of course do not yield anything like the weight of tubers one would expect if they were of greater size; but they are of good quality. Later sorts in fields and gardens are not in a promising state, being of weakly growth and of a yellowish colour, and inclining to curl in the leaf, and unless we have some rain soon I am afraid we cannot expect anything like the yield of last year. *J. Louisa, The Quinta Gardens, Chirk, July 16.*

ENGLAND.—NORTHERN COUNTIES.

NORTHUMBERLAND.—Potatoes are still looking strong and healthy, and the recent rains will greatly benefit them, and will likely yield well. Early crops are small, but good in quality, with no signs of disease. Barley and Oats in this district on light land and on hills are so short it will be almost impossible to reap them. Pastures in exposed places are almost bare, but the long-looked-for welcome showers will in some measure recruit and improve them. *D. Inglis, Hovick Hall, Leathurby.*

DURHAM.—The Potatoes are lifting clean and good, but owing to the drought are rather a small crop. Late varieties look well, clean, and healthy, and up to the present free from disease, and after the nice rain I expect they will lift a good crop, and turn out satisfactory. *J. Hunter, Lambton Castle, Fence House.*

— All looking splendid. No appearance of disease. *R. Westcott, Raby Castle, Darlington.*

YORKSHIRE.—Healthy; free from disease. Early ones small, very clean. Rain much needed for the late crop, which is otherwise very promising. *R. C. Kingston, Brantingham Thorpe, Brough.*

— Early Potatoes on high lands are very small, in consequence of the long-continued drought; they are better on low lands, where they were not flooded in May. Late field Potatoes are suffering for want of rain, on low land large breadths were flooded in May; the sets rotted, and they had to be replanted; in consequence are late and do not promise very well. *James Tindall, Sprotborough Hall Gardens, Downton.*

— The Potato crop is suffering very much from

dry weather; unless we have rain very soon both early and late crops will be bad. With the exception of a few slight showers in the last week, we have had no rain since June 1. All other green crops are suffering very much from drought. Turnips must be a failure with a few exceptions, that is, where they were sown very early; these make slow progress, but are ready for growth when the rains come. More than half of the land will have to be sown over again. *W. Culverwell, Thorpe Perrow, Bealae.*

LANCASHIRE.—Potatoes look well in fields and gardens, but it is too early to hazard any opinion as to crop and disease, as scarcely any had been dug in the district before the end of the first week in July and the tubers are still growing. *W. P. Roberts, Cuxford Hall, Preston, July 19.*

EASTERN COUNTIES.

LINCOLNSHIRE.—The crop of early Potatoes very deficient, owing to drought, only half an inch of rain having fallen in this district since June 3; no signs of disease at present, and the haulm vigorous. The result of late crops depends on rain. Copious showers on the 14th removed that source of apprehension. *W. Ingram, Belvoir Castle Gardens, Grantam, July 16.*

— Early varieties are a full crop, of good quality, and so far are quite free from disease. Late varieties are not so promising, having suffered very much from the intense heat and long drought, and cannot possibly be especially in light soils—a heavy crop. *W. Harris, Blanky, July 16.*

NOFOLK.—Considering the very dry period that this crop has had to pass through, they are looking well. We only had 0.39 of an inch of rain in the month of June, and up to this date (July 7) we have only 0.05 of an inch, with bright, hot days, and drying winds. No disease has shown itself in this neighbourhood that I have heard of, but we have not here had one thunderstorm this summer, though there has been thunder and rain in other parts of the county. *T. Wynne, Wroxham.*

SUFFOLK.—The cold and drought have been very unfavourable for the early kinds, the crops of which have been light, and the tubers small, but the late sorts are looking well, and will be greatly benefited by the rain that has come at last, and just in time to save them from suffering a severe check in their swelling. At present no disease is apparent, and it is to be hoped that the leaves are hardened sufficiently to be proof against the malady, or at least in a condition better able to resist the spread of the fungus. *J. Sheppard, Wolvestone, Ipswich.*

— Early Potatoes small, owing to the long spell of cold dry weather. Late ones also checked on light soils, as no rain fell to reach the tubers till towards the middle of July. Latest on good soils promise a full crop. No disease. *D. T. Fox, Hothwicke, Bury St. Edmunds.*

ESSEX.—Early Potatoes turn out well, particularly Veitch's Improved Ashleaf and Gloucestershire Kidney. No disease at present. Late Potatoes in this neighbourhood look uncommonly well, with every promise of good crops. *J. Vert, Audley End.*

— Potatoes are certainly very poor in our garden, and they do not look promising in the fields. The dry weather set in when the tubers were not larger than filberts. The tops dropped from the excessive heat. The early Potatoes are very small, and the others will "grow out" with a heavy rainfall. The cold antenial weather in spring prevented their starting well. *J. Douglas, Great Geaves, Ilford.*

MIDLAND COUNTIES.

STAFFORDSHIRE.—Potatoes are very late indeed in this district—so late that I cannot say much about them, only that they are looking very well, and there is every promise of their being good. What few we have lifted outside, though small, have been very good in quality, and free from disease. *John Wallis, Keele Hall.*

— The crops of early Potatoes are rather late and the tubers small. Veitch's Ashleaf turns out very good and free from disease. The late crops look promising, but want rain very much. *G. Wyther, Teddley Park, Penkridge.*

WARWICKSHIRE.—Early Potatoes a good crop on light rich soil but poor otherwise; late Potatoes look very promising since the rain fell, but everything is

from a fortnight to three weeks behind. *J. G. Temple, Packington Hall, Coventry.*

— Early Potatoes so far have been excellent; with a little more rain it is possible they might have been better, but as it is there is nothing to grumble about. Late varieties have fared worse; there need be no complaint this year of their having too much top suggesting winter planting, on the contrary the tops are small, more especially on heavy land, and I fear the Potatoes too will be proportionately less. The rains we are now having no doubt will incite a fresh growth, not perhaps very much to the benefit of the general crop. All other kitchen garden produce, when the soil is deep and highly manured, is excellent. Altogether the season so far as it has gone has been a smiling one. *W. Miller, Coombe Abbey Gardens.*

LEICESTERSHIRE.—All kinds of early Potatoes are turning out small through want of rain; late ones are looking well, especially where the ground was well manured; no disease at present. *G. C. Maynard, Cole Orton Hall, Ashby-de-la-Zouch.*

BEDFORDSHIRE.—The early kinds are fast ripening the haulm from the droughts, quality good, and very free from disease; the later kinds are looking well, but very much in want of more rain. No appearance of disease. *G. Ford, Wrest Park, Ampt-hill.*

BUCKS.—Early varieties good, and free from disease. Our best early varieties are Early Bird, Veitch's Ashleaf, Myatt's, and Snowdrop; this I consider the very best early Potato grown—it is hardly so early as Early Bird, &c., but it is more prolific. Late kinds all look promising, but they will be small unless we get rain soon. Reading Hero, Schoolmaster, Victoria, and Magnum Bonum are the varieties we depend on for a late supply. *J. Smith, Mentmore, Leighton Buzzard.*

— I have not heard of a single tuber being diseased, and in most places I have seen the Potato haulm never looked better on heavy land, but on gravelly soils they are completely roasted up, and the tubers small and past improvement. *P. Frost, Droghda, Malvernia.*

CHESHIRE.—Potatoes were late in coming in for use, owing to the cold, late spring, and the very hot, dry weather lately has caused the plants in light soils to wither prematurely, so that the produce is light and the tubers small in many cases. Late Potatoes look very healthy, and there is no appearance of disease at present; but it is as yet too early in the season to form an opinion upon it. *W. Whitaker, Cress Hall.*

SHERBURN.—Potatoes in this district have looked remarkably well till within the last week; but the haulm is dying fast now for the want of rain, and should we not get rain ere long I am afraid the crops, both of early and second early varieties, will be very light, quality very good. *R. Milner, Sandrone Castle Gardens, Shrewsbury, July 15.*

WESTERN COUNTIES.

SOMERSETSHIRE.—Potatoes that have been lifted have proved exceptionally good in quality, but the crops in many cases are light; Old Ashleaf and Veitch's Improved Ashleaf the most profitable, as these only of all the early and second early sorts have grown to their usual size. Soaking rains are still wanted for the late sorts, or the crops will be light. No disease is apparent at present. *W. Eggleton, Marston Gardens, Frome.*

HEREFORDSHIRE.—First earlies, got into the ground in good time, have done well, and although rather below the average size the tubers are now nearly ripe, free from disease, and excellent in quality. The sorts we grow are Veitch's and Myatt's Ashleaf, Mona's Pride, and a second early, called Lady Page, Covent Garden Market, or Favourite, also do well on our heavy soil, and, together with Lady Page, furnish our general supply of first quality until Potatoes come in the following June. Late varieties in fields, owing to the cold unsatisfactory condition of the ground, were unsatisfactorily planted. Then they were overtaken by the hot dry month, which came a little too soon, and at the present time look weak in the haulm. The change to showery weather may now bring about an improvement, but the tubers will be small even if they escape disease. With so many fine second earlies to choose from, it is to be regretted that late coarse varieties are so extensively planted by large

growers. As yet we have no sign of disease. *W. Coleman, Eastnor Castle, Ledbury.*

— I find no Potato to beat Veitch's Ashleaf, which I have been digging some time. The crop at present is plentiful; tubers small, owing to the dry weather. I have seen no sign of disease. Other sorts in the field look healthy and clean, and should we get favourable weather, a good crop will be the result after the very acceptable rain that has fallen. *W. Chinnery, Daventon Castle Gardens, Ludlow.*

WORCESTERSHIRE.—This crop so far shows no trace of disease, and the late and mid-season varieties will be greatly benefited by the rains which we are now getting, but unless the soil gets a good soaking rain very shortly the crop, we fear, will be smaller than usual. The Myatts which we have been lifting for use are decidedly undersized, although of good quality when cooked. With us Cosmopolitan and Woodstock Kidney are by far the best varieties for mid-season use. We are this season trying Sutton's Seedling and Sutton's Abundance, and to all appearance they will be very good, but for late use we find nothing to equal Scotch Champions, which are all that can be desired in quality. *W. Child, Cressome Court, Severn Stoke.*

SOUTHERN COUNTIES.

MIDDLESEX.—Late kinds are looking very well, and early ones have stood well on holding soils, but on shallow soils have suffered from the heat. Digging has begun of Beauty of Hebron and other early market sorts, but the tubers so far are not large. Much allowance has to be made for the lateness of the season, but should the disease keep off—and no evidence of it has yet been found—there should be a very heavy crop of Potatoes this year. *A. Dean, Eelfont, Feltham.*

SURREY.—Potatoes in this district are suffering for want of rain, early ones small, and late ones, although looking well in some parts, are ripening off fast in our neighbourhood, but a good rain soon may improve them a great deal. *J. Tanner, Tanbridge Cou, Godstone, July 15.*

— The Potato crop is very good. Kidney varieties have yielded abundant and good from the first plant, but the succession have suffered from the drought. The late crops are looking very promising; the rain which fell here on the 12th 13th, and 14th ult. has set the late ones up for some time to come. Up to the present there is no sign of disease in the haulm or tubers. The crops are a full fortnight late. The undermentioned varieties succeed best in this locality:—Ashleaf, Veitch's Improved, Beauty of Hebron, Magnum Bonum, Miss Fowler, Welford Park, Wormlight Seedling, Chiswick Favourite (is doing very well), Coldstream, M.P., Schoolmaster, Vicar of Lisleham, and Porter's Excelsior. *A. Evans, Lythe Hill, Haslemere.*

KENT.—Early sorts are ripening off and turning out very good, but small, in consequence of the drought. Late kinds are looking better, but will soon come to a standstill if no rain comes. If this happens superabundance will be almost certain to follow, consequently a good Potato crop is very doubtful this season. *H. Cannell, Swanley.*

SUSSEX.—The prospect of a good crop of Potatoes with me, as a rule, is good. Throughout my sixty good standard kinds I have not seen any signs of Potato Blight; but in this district, in some of the cottage gardens, it was seen on July 2, and in one or two cases badly. I may say throughout this district in all the cottage gardens Potatoes are looking well. We had two storms of rain equaling 1½ inch within the last two days; hence I fear we may see something of the disease. The twelve kinds which are looking most satisfactory are:—Fritzaker, Myatt's Ashleaf, Reading Kaiser, The Dean, M.P., Vicar of Lisleham, Edgemoor Seedling (purple), Miss Fowler, Snowdrop, Beauty of Hebron, Cosmopolitan, and Beauty of Kent. *S. Ford, Leonardlee, Horsham.*

HANTS.—The early varieties are unusually good, the yield being much above the average; there is not a speck of disease, and the quality is superb. We have discarded all the early American kinds, and reinstated the old Ashleaf, Walnutleaf, and Lapstone. Dean's Midsummer Kidney is a new variety belonging to this early section that bids fair to rival the older varieties. Our best early round kinds are Fenn's Early Regent and Sutton's First and Best; both are of the highest quality, and crop splendidly. In spite of the intense heat and drought

late varieties are looking extremely well. *W. Wild-smith, Heckfield Place, Winchfield.*

WILTS.—The Potato crop promises to be an all-round good one this year. The haulms are sturdy and healthy looking, and the tubers of early varieties plentiful and good. Dwarf haulms, as a rule, produce a greater weight of Potatoes from a given space of ground, and of better quality, than would be secured from those of a more luxuriant growth. However, it is rather early in the season to express a definite opinion about late crops, further than saying that if the weather during the months of August and September be moderately dry they are likely to be, as already said, good, and free from disease. *H. W. Ward, Longford Castle.*

DEVON.—Potatoes are excellent in quality. Early kinds are of good size, but it is feared the second earlies and late kinds are checked by the drought, so that if the crop is abundant the tubers will be small. Beauty of Hebron takes the lead with early kinds, for all purposes. No disease seen up to the present. *D. C. Powell, Powderham Castle, Exeter.*

—Early Ashleaf Kidneys are wonderfully fine and sound, so also is Covent Garden Perfection. Owing to the continuation of dry weather the foliage is drying off. Some of the late kinds look fresh in the top; the tubers appear to have stopped growing. A few light showers would most likely produce super-terbation. A good soaking of rain would save the late kinds. The soil hereabouts is rather light and shaly. I find with deep trenching, and plenty of manure added, the soil is the most productive I have met with. *G. Baker, Membrand, Plympton.*

CORNWALL.—Potatoes are exceedingly good and plentiful. The fine weather of the past three weeks has finished them off splendidly. The earliest are nearly all ripe, and the field crops are very promising. Not a spot of disease is visible. *C. Lee, Bocomac, Lostwithiel.*

CHANNEL ISLANDS.

JERSEY.—The Potato crop has been and is abundant—6, 7, and 8 cabsots (40 lb. weight) to the perch of 22 feet square. Jersey weight is 8 per cent. heavier than English weight, i.e., 104 lb. are equal to 1 cwt. The price has been very vacillating, owing to the mode of traffic at the St. Helier's weighbridge. The quality has varied according to the sort, and the state of maturity they were brought in. Myatt's Prolific Kidney is the favourite variety as a first crop. Webb's Imperial Kidney (renamed Early Jersey Fluke), and Lapstone Kidney are varieties much grown as secondary crops. Owing to the large size of the first of these varieties they are often dug before they are ripe. The crops of these and also of the later varieties promise to be fine and good. The weather has hitherto been very favourable. Should heavy rain succeed this long period of drought the late Potatoes may suffer. *C. B. Saunders, St. Saviour's.*

GUERNSEY.—First and second early Potato crop has been heavy and very good quality. But prices have ruled so unprecedentedly low that the profit remaining is but infinitesimal. Late sorts are also promising heavy yields. *Charles Smith, Caledonian Nursery.*

DISEASE OF OATS.

HETERODERA RADICICOLA, Müller.

UNDER the name of Root-ill, Thick-root, Tulip-root, or Segging, a disease of Oats has, according to the *Scottish Agricultural Gazette*, become of late alarmingly prevalent in certain Scottish districts. A correspondent says the effect is to almost entirely destroy the crop of Oats. The disease is referred to by Dr. Aitken in his report on the Oat crop at the Highland Society's experimental station at Pumpherton, published in this year's *Transactions*, but no positive results are given. Under the pseudonym of "Triptolemus" a writer in the *Scottish Agricultural Gazette* very correctly describes the appearance of affected crops. He says:—"Some weeks after the braid, when the plant is from 4 to 6 inches in length, it assumes a tufty, bushy character, and if pulled up the bottom of the plant will be found to be of a bulbous nature, with few, if any, root-fibres growing from it, the whole presenting a spongy, unhealthy appearance. In a few weeks the plant thus affected withers and dies, and where a field is badly diseased, at harvest there is nothing but a few

short green stalks with abortive heads." The same writer says the disease is only found on the heavier soils, being very general on the medium and heavy soils of Midlothian; and in good tolerably open loam, a soil inclined to be cloddy in dry weather following wet, if not carefully worked. The disease is practically unknown on the lighter, freer soils of Peebleshire. Diseased crops have been grown on the four-course rotation for many years. It is usually worse in wet springs followed by dry and cold weather after the crop has braided, like the weather of the last two seasons; the places that are affected may generally be observed to be in a lumpy, hard condition—a bad tilth in fact. The writer in the *Scottish Agricultural Gazette* then expresses an opinion that Tulip-root is

of the plants taken from beneath the ground-line immediately reveals the cause and nature of the disease, for every portion of the affected parts is alive with nematodes, or microscopic thread-worms. These nematodes, with their eggs and young in all stages of growth, and full of vitality, exist in thousands in the distorted parts of the host plant. At A the eggs are shown with the young coiled within, and at B the infant worms just emerged from the eggs, and at C the mature nematodes, enlarged 160 diameters. I take the worm to be *Heterodera radicicola*, Müller, and the disease to be identical with the "Rotergallbildungar hos korn" of Norway and Sweden. The nematode just mentioned forms little gall-like nodosities on the roots of corn, and these galls, full of eggs, are broken off, and left in the soil, unless the plants are taken up with great care. The same nematode attacks the basal parts of the young plants. The young leaves of Oats are furnished with an abundance of short transparent hairs, and it is curious that these hairs agree in size and transparency with the mature nematodes, but there is no difficulty in distinguishing one from the other. The worms are of course full of life; they are, however, inclined to be somewhat quiescent at first, as the moisture existing naturally in growing Oats is not sufficient for much graceful coiling and twisting about. The addition of a drop of water under the cover glass of the microscopic slide soon sets any nematodes which may be temporarily quiescent into a state of active vitality. The examples of diseased Oats with nematodes here illustrated are now in the Department of Botany, British Museum, South Kensington.

The application of lime to the soil, the exposure of the soil to sun and frost, and the cessation of Oats and grass for a season or two as a field crop, would probably tend to reduce the numbers of this destructive pest.

Heterodera radicicola, Müller, is a near ally of the nematode which causes "ear-cockle" in corn—*Tylenchus tritici*, of Bastian.

Nematodes have several times been illustrated in the *Gardeners' Chronicle*, as in the case of the Cucumber disease. Of the most remarkable of these are the nematodes of *Odontoglossis*; see *Gardeners' Chronicle*, Jan. 9, 1886. *Worthington G. Smith, Dunstable.* [The same species has been described in the roots of various grasses. ED.]

VINES AT TEMPLE NEWSOME.

WHEN old Vines have been reduced to a weak enfeebled state through hard forcing, or some other cause, it often becomes a question whether it is not better to start afresh with new plants than to attempt to bring them round again. There is something to be said in favour of each course, and in this, as in other matters, cases after circumstances, so that no fixed rule can be laid down. Independent of this there is often reluctance on the part of those who are concerned in their culture to part with the old Vines. This much may be said, that it would be difficult to name a plant which, after having been reduced to an exhausted state, can be thoroughly renovated in the way that Vines admit of being.

At Temple Newsome may be seen an example of this in the case of old Vines that were so weak that many gardeners would have condemned them as being useless. Yet their condition now, both in respect to the growth and fruit they produce, is one of the instances that one sees of the recuperative power inherent in the Vine. The Vines are forced so that the fruit is ripe at the beginning of May, the sorts consisting of Black Hamburgh and Foster's Seedling. When I saw them in the middle of last June the crop was almost gathered, but the bunches that remained were well finished examples, which Mr. Dawes has this season been successful with at the York show and elsewhere. The second viney contains Madresfield Court, Muscat of Alexandria, and Muscat Hamburgh, carrying a good crop of handsome bunches. Another house is occupied by Muscat of Alexandria, Mrs. Pince, Muscat Hamburgh, Gros Colmar, Alnwick Seedling, and Gros Guillaume, all of which are bearing good crops; the last-named variety has a number of large bunches that look as if they would be quite equal to the splendid examples with which Mr. Dawes took 1st prizes last autumn at the Crystal Palace and at South Kensington. The same may be said of Gros Colmar, which also took 1st prizes last

FIG. 31.—TULIP-ROOT DISEASE IN OATS AND THE CAUSE, —
HETERODERA RADICICOLA, MÜLLER.

caused by an "unfavourable condition of the soil such as to prevent a free spread of the root-fibres," but with this opinion is erroneous, the possible remedies as quoted by "Triptolemus" must necessarily fail. The writer just mentioned, however, says:—"A very generally held belief is that the disease is the result of a too frequent recurrence of the same crop." This belief is no doubt founded on correct observation.

In the accompanying illustration (fig. 31) the basal portions of four young Oat plants are shown natural size. The general absence of root-fibres, the generally swollen bulbous appearance (hence Tulip-root) of the new growths, and their contorted, twisted, knotted aspect, must be noted. To the touch the newer of these smaller growths are soft and pulpy, whilst the older ones are hard, brown, and dead.

A microscopic examination of the swollen parts

year at both these shows. Two large houses are principally filled with Lady Downe's and Black Alicante, looking equally promising.

In the earliest Peach-house most of the crop was cleared, but the fruit that remained was of good size and well coloured. In the second house an even crop was coming on. A new house, built the winter before last, contains a fine lot of young trees that have made good progress.

Fig trees that are planted out have a house to themselves, and are in good bearing condition.

Pines are very well done; the fruiting-pits contained a number of Queens that looked as if they would weigh from 5 to 6 lb. each. The succession-pit was occupied by as good a lot of stout, short-leaved plants as one could wish to see.

Melons are grown in quantity, a range of low houses being filled with healthy plants in various stages. The plant department at this garden is not lost sight of; in a large high old-fashioned conservatory there was a fine lot of Camellias. The plants, which are planted in the centre bed, have attained a large size, and are in faultless condition. A few large dense bushes of this plant were found in several of the vineries. Two small houses are devoted chiefly to Orchids, which consist of a selection of Cattleyas, Lælias, Aërides, Dendrobiums, Cælogynes, and the cooler kinds such as Odontoglossums and Masdevallias in a healthy thriving state. One side of a span-roofed house is filled with greenhouse Rhododendrons, which thrive and bloom well.

Out-of-doors, Apricots have set better than Peaches this season; on a long wall covered with large healthy trees there is an excellent crop. Plums also are bearing a full crop. Apples have set better apparently than in the southern counties. The grounds attached to this fine old historic place are extensive, and are well kept. The flower garden in front of the mansion deserves especial mention for the good taste that was displayed in its formation. The error so often made has been avoided of over-filling the lawn with beds and leaving insufficient turf surface to set off the colours. Inattention to this point has had much to do with the discredit attached to massing out in the flower garden. The planting also has been very well done. *T. E.*

GLOXINIAS AT MESSRS. SUTTON AND SONS' NURSERY, READING.

As is now pretty well known by gardeners, the best strains of our commoner flowers and vegetables are quite as much the result of patient selection of types exhibiting some desirable characteristic—the work extending in almost all instances over many generations of the plants operated on—as of felicitous haphazard crosses. An instance of the results following patient selection of plants with good points is well shown in the Gloxinias at Reading. These favourite plants, which in this instance were sown last February, are arranged in several span houses, and well repaid a visit made to the nursery recently.

It is almost superfluous to say that the management of the plants is understood perfectly, and well they have responded to the art of the cultivator, as was seen in the robustness of both foliage and flower. Being now in flower the younger batches enjoy an atmosphere suited to their wants at that stage, and differing much from that prevailing in the houses during the growing season. There is much less moisture in the air, but little artificial heat, and to preserve the blooms at their best shading is constantly kept on. During the period of growth the air is kept extremely moist, and that without ever allowing the foliage to get actually touched by water; great care being also used in watering.

In selecting plants for hybridising several important points are kept in view, such as robust foliage of great substance and breadth, with shortness in the leaf-stalk, and an inclination to droop over the pot, so as to hide it from view. So much for the leaf; the flower must have a stalk sufficiently stout to require no support, the lobes of the flower overlapping, and the whole substance capable of retaining its proper form for a considerable length of time. The colours are as varied as possible, both in the erect and drooping varieties, consistent with elegance, and an effort is being made to secure them with a distinct white termination at the bottom of the throat. Some of the strains observed are netted over the area of the lobes like the Tydeas, the veins forming the

network being usually white, or white suffused with the prevailing colour of the flower. No crosses have been obtained with either this species or with the Gesnera, although seed-vessels sometimes result, but the seed is always infertile. A spleenoid white Gloxinia with a very long tube with overlapping lobes, and of great substance and fine foliage, was observed. This is an immense acquisition.

Under the careful efforts made here the flimsiness of the plant has quite disappeared in flower and leaf, but the Gloxinia still remains a stove plant, or, at the most, a subject for the intermediate-house when in flower in the summer months, and has special requirements of treatment, which must be attended to by all who would excel in its cultivation, not the least of which are mild doses of liquid fertilisers. *M.*

TWO NEW ORCHIDS.

DENDROBIUM WILLIAMSIANUM.—This exceedingly rare species (fig. 32) was shown at South Kensington on July 13 by Mr. E. S.

FIG. 32.—*DENDROBIUM WILLIAMSIANUM.*

Williams, Paradise Nursery, Holloway, and received a First-class Certificate from the Committee. The *Dendrobium* was introduced from New Guinea eight years ago by Mr. Goldie, a traveller in those regions, but has but only just now flowered for the first time. The racemes, which are produced from the upper part of the pseudobulb, bear about six flowers, which are of an ivory-white colour and of a roundish form; throat and lip purple. The pseudo-

FIG. 33.—*PHAIUS HUMBOLDTII.*

bulbs are terete, slender, tapering, and possessing a few small leaves. Now that the plant has shown its beauty we hope to see it in general cultivation.

PHAIUS HUMBOLDTII.

This elegant new little Orchid (fig. 33) was also shown at South Kensington on July 13, by Sir Trevor Lawrence, Bart., when a First-class Certificate was awarded to it. *Phaius Humboldtii* has oval sepals and petals of a pinkish-purple colour, and of an equal size; lip rosy-purple, white base, winged at the base, and having a bright yellow central crest; flower stems about 18 inches in height, bearing about eight flowers 2 inches in diameter; leaves like those of the genus generally; pseudobulbs stout and globular. The plant is a native of Madagascar, where it was discovered by the traveller whose name it bears—Humboldt, not Humboldt, who was never in Madagascar. This fact is to be remembered, as P. Humboldtii has been called by the misleading name of P. Humboldtii. The plant is well worthy of cultivation.

THE CUTTING OUT OF LANDSCAPES.

How often is it true that we cannot see the forest for the trees? The saying is equally and more forcibly true of landscapes. Their beauty is hidden, grown in by the very prodigality of their furnishing; a mere mass of wood or forest is not a landscape—trees or shrubs alone, or in combination, fail to form such. True, these must be present in sufficient number and bulk to form the basis—the shadows of the landscape—but open spaces, to enable these to be seen are essential to its completion. The latter are the lights that raise the shadows into matchless things of beauty—the joys for ever that win our hearts and captivate our imagination. But just as many a fine picture loses half its charm through its excess of shadow, so thousands of our fair landscapes have been marred and ruined through excessive planting, and the excessive use of coniferous trees; the latter having robbed many a bright landscape of all its cheerfulness, and brought it down to the sombre level of the old churchyards, except in spring and summer.

At last the mania for coniferous plants mainly, or only around demesnes, has been arrested. But before the planting can be nicely adapted to the light of our climate great clearances of coniferous trees must be made from a landscape. The common Scotch Fir, as it grows in age and stature, does its best to neutralise the dense black shade of its top by the ruddy glow of its stems. But to derive any benefit from this natural relief the trees must be seen singly, or in groups of such size as to allow the light to play on the stems with such fulness and freedom as to bring out this ruddy glow of brightness; bringing us back to our starting-point, that no landscape can be complete without light as well as shadow—that is, masses of shrubs and trees and clear spaces between them, to enable the former to be seen to the best advantage. All this will be the more apparent if we take the primary meaning of landscape as a land view from a ship. The open sea between the beholder and the land floods the most beautiful objects upon the latter with light, and thus presents them to the beholder in the most enchanting and bewitching aspect. It is a mistake often made to affirm that it is distance alone that lends enchantment to landscapes from ships at sea. No doubt in many cases this has its influence; but the chief cause of the additional charm is the open space that enables each detail of form, colour, harmony, or contrast to be seen in all its full meaning and significance.

All this is merely to show the vital importance of cutting out landscapes—that is, of having sufficient clearance not only to balance our shadows with light, but to furnish view-space sufficient to enable every beholder to see all the beauties of the living picture. As well try to discover the merits of pictures crowded almost within touch of each other as to reveal the beauties of landscapes crowded into mere blocks of trees or shrubs. By cutting down full half or more of the trees in many parks or pleasure-grounds the landscapes would be marvellously enriched and even indefinitely extended. In such cases a part would then prove infinitely better—that is, richer and more beautiful—than the whole. In this sense open spaces are as much or more desiderated in the country as the town. In the latter they purify the air, in the former they extend and enrich our view-line, as well as give the atmosphere freer sweep around our dwellings.

The dense smotherings of trees and shrubs that too often surround our homes, that descended to us from the days when the single canon of "Hideall buildings" was accepted and practised by landscape planters as the alpha and omega of their art, are neither wholesome nor beautiful, and the sooner the axe is laid at the roots of many of those concealing belts the better. It is, however, in those and similar clearances that the true landscape artist develops his taste and his genius. Instead of a general clearance, resulting in baldness, the belts or woods should be broken up into groups, beautiful and graceful in themselves, while bringing out or letting in all the salient points of the building and of woods, parks or other features of interest in the near or distant landscape. The amount of beauty shut out of our landscapes by such unworthy motives as the confining them to the possessor's own property, and other personal or social limitations, are lamentable from an artistic and national point of view. Now that more catholic

views and tastes prevail, the cutting out of landscapes should include, as far as possible, every available feature of interest and object of beauty.

Frequently these charms in most parts of the country—landscapes of superlative beauty—are waiting to be revealed—over the hedge or on the other side of the belt that envelops hundreds and thousands of demesnes. The desire of isolation, the assumed necessity for shelter—the love of privacy—all combined to shut in gardens and demesnes from the outer world. Meanwhile not a few futile attempts were made to create landscapes within the limits of small estates, which never could by any amount of skill equal those so successfully shut out. With the view of crowding much into little space, these were mostly overplanted, and resulted in a mere crowding of trees and shrubs instead of a chaste and finished landscape. Under such circumstances few things are easier to skill and taste than to link the smaller elements of beauty within the demesne to the larger and broader features of interest outside.

Occasionally the mere cutting of a few gaps in narrow belts or hedges will reveal permanent features of surpassing richness and beauty, such, for example, as a group of Cedars of Lebanon on a knoll in a distant park, a mass of purple-hued Silver Birch, with Elm, Pines, or Horse Chestnuts—a distant lake or river flanked with drooping Willows, backed with a glimpse of a dark Pine forest in the far distance. These are but mere suggestions of simple elements of landscape beauty that may mostly be had in plenty by simply letting them in from a distance.

As already remarked, the interest, beauty, apparent extent, and enjoyability of most places, may be multiplied many-fold by cutting sufficiently large clearances to enable their many features of interest and beauty to be seen. In fine, the one want of thousands of landscapes is light—more light—and this may be had in any quantity by simply letting it in by cutting.
D. T. Fish.

SCOTCH NOTES.

THE BOG GARDEN IN THE ROYAL BOTANIC GARDENS, EDINBURGH.

THIS feature in these well managed gardens, if not the most extensive or important, is one of the most interesting to the genuine lover of plants. The lessons to be learned by an inspection of the various plants growing in it are many and valuable. The most important of these to us, perhaps, was gathered from the extraordinary success that had attended the planting out of *Cyananthus lobatus*. Every one who has tried his hand on the culture of this lovely gem knows how coy a thing it is to manage satisfactorily. Here in this bog garden there is not only no difficulty experienced with it, but it absolutely luxuriates in patches from 15 to 18 inches in diameter, clothed with healthy foliage and masses of its lovely blue flowers, the latter of such enormous size as we have never seen before in the most successful specimens that have ever come under our notice. The plant is perfectly at home, and those who wish to succeed in like manner must copy the conditions under which it grows here.

The bog garden is slightly elevated above the level of the adjoining pond, devoted to aquatic plants, and only separated from it by the width of a commodious gravel walk and a strip of grass only a few feet wide. It was formerly a ditch, and was recently filled up by Mr. Lindsay with soil suitable for the plants that he wished to establish in it. A few drains were carried from the bed across the grass and path already mentioned in order to keep the surface dry and sweet. These are briefly the details of the construction of this bog garden, and Mr. Lindsay has been no less happy in settling them than in the selection of the plants that occupy it. Splendidly healthy clumps of *Saxifraga hirculus* and a kindred species from the Himalayas (*S. diversifolia*), yellow-flowered and spotted in the same delicate and beautiful manner, were growing and flowering most freely. The latter is a taller species than the former, and has broad ovate cordate radical and cauline leaves. *Primula denticulata* was simply marvellous in its luxuriance. The foliage was from 18 to 20 inches in height, and of proportionate breadth and substance, and the midribs were conspicuous in their breadth, and in the rich red colour that marked them throughout. Some of the flower-scapes were standing

though the flowers were over, and measured 2½ feet in length. *P. scotica* and *P. Stuarti* were equally remarkable for their abnormal luxuriance. *Callia leptosepala*, a pure white-flowered North American species; *Parossia rubicola*, from the Himalayas, with much larger, but scarcely so pure white flowers as our native *P. palustris*, along with many other interesting things were all in the most satisfactory condition. Mr. Lindsay will, no doubt, extend his experiments in this way to other species usually cultivated in pots or on rockwork. What an advantage it would be to cultivators of plants of the classes indicated if they could dispense with the tedious troublesome methods usually practised in their management, and what an enhancing of their enjoyment if by such simple means they can attain like results to those described above with other equally desirable and more or less difficult subjects to manage in the common way.

THE ROCK GARDEN.

In the rock garden and other parts of the Botanic Gardens we noted an interesting form of *Chrysanthemum leucanthemum* with large tubular ray florets, discovered by Professor Dickson during a botanical ramble some years ago—a transition in form which may possibly lead up to a valuable hardy double white flower for cutting and decorative purposes; the purer white of the flowers, and the absence of the unpleasant odour of *Matricaria*, would give such an acquisition, if obtained, a first-class position in the estimation of florists who have to cater for the market in cheap flowers. A grand undetermined species of *Eriogonum* will be looked for with interest once it is named, and find its way into commerce. The plant grows to the height of about 2½ feet, with enormous rose-lilac heads of flower from 3 to 4 inches across. *Dianthus cinnabarinus* is a gem of great attractiveness, with flowers in the way of *Linum grandiflorum* as to colour, but a shade or two lighter, and very fragrant. The plant is neat and compact, about 9 inches high, rather wiry in habit, and with sparse foliage. *Delphinium Brunonianum* (the Musk-scented Larkspur), was flowering freely, and if not one of the brightest of its tribe it is at least one of the most characteristic, apart from the powerful odour of musk it emits from nearly every part when it is handled. *Campanula trachelium* alba, raised by Mr. Grieve, Fyfe Nurseries, Edinburgh, is unquestionably the best of dwarf white *Campanulas*, the purity of the colour is perfection. *Dianthus Atkinsonii*, as seen in the rock garden here, is evidently the single prototype of the better known double Pink, Napoleon III., and a brilliant free-flowering plant it is. *Gaillardia maxima* is, perhaps, the grandest of the species. The ray is rich golden-yellow, the disc brownish-orange, and the individual flower-heads range from 4 to 5 inches across. A large mass of *Cacalia alpina*, with bright rosy Eupatorium-like flowers in rich profusion, combined with an easy yet compact habit of growth, arrested the attention and suggested its fitness for a good position in ornamental herbaceous borders. The species is a native of the Swiss Alps. *Celmisia spectabilis*, with Cordylone-like habit and foliage, hoary, with silky adpressed down peculiar to many of the Composites, is a strikingly characteristic plant for rockwork. The flower-heads are large, the ray pure white, the disc deep yellow. The polypletalous form of *Campanula rotundifolia* deserves to be better known than it is; apart from the extraordinary eccentricity of the structure of its flowers it is one of the most ornamental and profuse blooming of the family.
X.

TREES AND SHRUBS.

PHILADELPHUS GORDONIANUS.

APROPOS "R. D.'s" interesting remarks (p. 43) on the Sydney Gardens, Bath, I may be allowed to say, while endorsing all that your correspondent has so well said respecting them and their management, that nowhere else have I ever seen so many fine and well-flowered bushes of the *Philadelphus* as those which alike delighted the senses of seeing and smelling of the numerous visitors to the above-named gardens on the occasion of the recent Rose show there, the showy white and highly odiferous flowers filling the atmosphere of the gardens with their pleasant perfume. The simple leaves of these handsome shrubs are large and fine looking, the flowers being unusually

large (nearly 2 inches in diameter) and sweet. Judgment has been used in the planting of this not sufficiently often met with shrub singly in conspicuous places and at proper intervals from one another, so as not to render the air too strongly perfumed with their odour in any particular part of the gardens. Bearing in mind the easy culture of this American species of the "Syringa" of gardeners, together with the chaste and sweetly scented flowers which the plants produce so freely, the wonder is that it is not more extensively grown in shrubberies and other frequented spots near to the walks and drives. It will succeed in almost any description of soil and situation. *H. W. W.*

CARPENTERIA CALIFORNICA.

I was much pleased on seeing *Carpenteria californica* figured in the *Gardeners' Chronicle* last week. The figure is a very good one, showing the flowers of right size and shape; the leaves ought to be somewhat larger. Two or three years ago, at the time I was foreman at Wilhelmshöhe Castle, this species of *Carpenteria* flowered there for the first time in Germany. I sent flowers to Prof. Wittmack, who, (if I remember correctly) figured them in the *Garten Zeitung*. A plant of *Carpenteria* of now about 6 feet high in Wilhelmshöhe, is placed in a basket in the open ground during summer, and put in a cold frame in winter. So treated, it succeeds well, having flowered profusely these last three years. A smaller plant of it, left outside, survived two winters, when the cold did not exceed 20°, but the last winter, with 30° to 40° of cold, killed it.

RUBUS DELICIOSUS.

This is another fine flowering shrub. It is of shrubby habit, not climbing, spinose, the flowers being large, pure white, appearing at the end of the branches. This shrub must stand free, to show its full beauty; some pruning is necessary to keep it in good shape. Kept in good order, and planted on the right place, it is a beautiful thing, well worth a place in every collection. It is perfectly hardy, even in our Continental climate. *C. Wissenbach, Friedhofs-Inspektor, Cassel, Germany.*

The Flower Garden.

PROPAGATION OF PELARGONIUMS.

IT is now time that steps were taken to secure the requisite stock of Pelargonium cuttings for the filling of the flower-beds next year. There are various methods employed to secure this purpose, but either of the following will meet the exigencies of most cases. In the first case you have a pit with a row of hot-water pipes all round to exclude frost and drive out damp. On a level hard bottom 3 or 4 inches of loam, leaf-mould, and sand in equal quantities is placed, after being passed through a three-quarter inch riddle. In this the cuttings are pricked from 2½ to 3 inches each way. The sashes are removed night and day, except during heavy and continuous rains. The plants remain here until the following February or March, when they are potted into 48 pots.

The next best plan is to use shallow wooden boxes, 2 feet long, 15 inches wide, and 4 inches deep. Each of these boxes will hold about fifty cuttings. The bottoms of the boxes must have a ready outlet for water. Place some of the roughest siftings of the compost in the bottom, then fill up to the edge with the compost previously recommended pressed moderately firm. As soon as the cuttings are put in they should receive a good watering through a fine rose, and be removed to the south side of a wall or hedge in the full blaze of the sun. The boxes are better placed on bricks or blocks of wood to prevent them from decaying and to keep worms from entering. If a pit or frame can be spared to stand them in, the sashes can then be used to protect the cuttings from rains, but where these are not available some protection can be afforded them with mats or canvas. They will, however, be required to be removed under protection on the slightest indication of frost or continuous rains.

The third system is to employ 45's, 32's, and 42 pots. This is a very suitable plan where a limited quantity is required, and recommends itself to the amateur where plants have to be wintered on narrow shelves; but

this system entails a greater amount of attention in the shape of watering than either of the former systems. The tricolors, gold and silver leaved kinds, should be started with. First secure one or two cuttings from each plant. These should not be less than 6 inches long, and they will be all the better if they are 8 or 9. They will require the foliage removed from the two joints next the base, and any wood remaining beyond the lowest joint should be cut off with a sharp knife. They will be none the worse for being spread out in the sun for an hour or so after they are made, to dry up the sap a little. *W. M. Baillie, Luton Hoop Garden.*

THE ORCHID HOUSES.

ODONTOGLOSSUMS AND MASDEVALLIAS.

WHEN a collection of Orchids is commenced in any place it is often said that that particular district is best suited to one particular class more than another, and I think this is so with cool Orchids. If I had the choice in the matter of locality in which to grow these in the best possible way, I should give this question some consideration. But as a rule there is but little choice allowed where to build an Orchid-house, and we must do what is best under the circumstances. If a gardener should see a better grown collection than his own, he can soon learn if they are treated about the same as his in the matter of ventilation, water, temperature, and shading; and if the treatment is the same, I should say the difference in appearance was due to locality. Many gardeners would think it rather curious practice to give plenty of air in wet and sunless weather, and reduce the ventilation as soon as the sun shines, but I would advise those that have Odontoglossums which are more brown or rusty-looking than they care to see to try this system; but care must be taken to have a thick shading. If the house is a span, running north and south, the shading can be raised 9 or 10 inches at the bottom to let in the light; if the span runs east and west, the shading on the north side can be raised at the bottom 1 foot 6 inches; and the same applies to a lean-to with a north aspect—in all cases letting the blind supports project beyond the eaves of the house, so that the sun cannot shine underneath the blind late in the afternoon. Where convenient a lean-to house facing east is good for cool Odontoglossums and Masdevallias.

ONCIDIUM JONESIANUM.

Oncidium Jonesianum will prove itself to be a fine Orchid when we discover its requirements. We have some growing close to the glass on the north side of the Phalaenopsis-house without shade, and near to the opening at the eaves; they appear to enjoy the afternoon sun, growing and flowering freely, some bearing spikes with upwards of twenty blooms. Some plants are growing in the Cattleya-house; these flower as freely but are rather later, and I think they are likely to keep in good health longer in the Cattleya-house. The roots of *O. Jonesianum* dislike any wet material about them, either peat or moss; and after trying them in different ways I find they will root fairly well on cork or wood with the bark left on, but after a time fungus makes its appearance. Some plants are fastened to pieces of tree fern stems, but if this be kept in a wet state the roots of the Orchid die off. At present those grow best that are fixed to Teak rafters having the leaves turned downwards; they are watered with the syringe two or three times in the day if the weather be bright, always letting them dry thoroughly before damping again. *Leptotes bicolor* and varieties also do well in the Cattleya-house, suspended from the roof.

GENERAL DIRECTIONS.

During dull weather very little syringing or damping down is required in any department; as our summers are so changeable I do not think there can be any rule laid down for damping any house a certain number of times in the day, for the state of the weather furnishes the best guide in the matter. If gardeners growing Orchids pay particular attention to this they will not be troubled with their fine growths rotting off after taking so much previous pains with them. Houses in which East Indian Orchids, Cattleyas, and Dendrobiums are grown should not be deprived of fire-heat entirely. In the early morning the air in these houses will feel very

chilly at times; and if we can prevent only one valuable plant from being thrown into bad health by giving a little heat, that alone will repay the cost of the fuel consumed. *C. Woolford, Downside.*

PLANTS AND THEIR CULTURE.

THE GREENHOUSE.

GREAT attention must be paid to the choicer kinds of greenhouse plants, to see that they do not get soddened with rain. A temporary framework with odd lights laid on makes a good protection, but a thick blind on rollers let down when required will answer very well. Keep a sharp eye for mildew, and when any trace of it is perceived dust over at once with flowers of sulphur. From this time onwards there will be many soft-wooded subjects in this department that require to be kept growing freely, such as *Cinerarias* and *Primulas*; the first lot of these should now be in 45's, others should be shifted when large enough; and any plants that were marked when in bloom for seed or for propagation should now have the side shoots taken off carefully and potted: this applies to the *Cineraria*. A late sowing of each, as well as of *Calceolarias*, may be made. *Kalosanthes*, which are now going out of bloom, must be cut down to within 2 or 3 inches from where the shoot originated. Keep the plants in a light airy place for the present, reducing the amount of water at the roots. Put in cuttings; these strike freely in pits, frames, or on shelves. *Fuchsias* which are growing and are wanted to flower late should have a liberal supply of liquid manure, and be kept shaded and in a cool aspect. *Salvias*, *Solanums*, and early *Bouvardias* should now be in their blooming pots, this batch coming in most useful before the *Chrysanthemum*. Give them plenty of stimulating food as they fill their pots with roots. Plants of *Ardisia crenulata* are best placed in a light position when swelling their berries, giving sufficient warmth to enable them to grow freely. *Tropeolum Ball of Fire* should now be shifted on in its blooming pots; cuttings should also be put in for late supply. These when grown freely are good for training on main rafters.

Cuttings of *Ficus repens* put in now quite thickly in large 60's or 48's come in very useful for indoor furnishing, more especially during the winter, when the rooms are kept warm, and Ferns then go off quickly. *Lapagerias* which have been run up to the glass, and are now showing bloom, may be brought down to the balloon trellis to expand their blooms, when they may be moved into the conservatory or other place. All climbing plants which have done flowering should be well syringed to keep under red-spider. *Telargoniums* which were placed out-of-doors to ripen their wood after flowering will now be ready for cutting back, which should be done at once, leaving from three to seven buds or eyes according to age or size of the plants, and for the purpose for which they are likely to be required next season. If required of a large size, shoots to the length of 5 inches may be left on them, as these can be pegged down or tied out to form the foundation of the specimen. After pruning they must be kept somewhat drier, as there will be less root-action till they begin to break; they should be placed in a pit or frame after the operation. An occasional dewing overhead will induce the buds to break. This remark applies more particularly to the fancy varieties, as they do not break so freely as the large leaved varieties. Propagate any variety which it is desirable to increase; these strike freely if placed in a cold frame or pit, and shaded, dewing them overhead on hot afternoons. *A. Evans, Lythe Hill, Haslemere.*

FRUITS UNDER GLASS.

MELONS.

PLANTS intended for supplying fruit during the months of November and December should, like plants intended for fruiting in spring and throughout the summer and autumn, be planted on the mounds before their roots become cramped in the seedling (3-inch) pots, but should the house in which they are to be fruited not be ready for their reception, shift the

plants into pots a size or two larger than those in which they are growing, so as to prevent them from experiencing a check, which would assuredly follow any stunting of growth. Plants now coming into flower should have their expanded flowers impregnated with the male pollen when it is dry, and a more airy and dry atmosphere is given to them, until the desired number of fruits to form the crop is secured. As soon as it can be seen which are going to swell, reduce the number to four or five, according to circumstances, on each plant. In houses and pits in which the fruits are ripe and ripening, maintain a free circulation of fresh air, so as to give flavour to the fruits. Plants swelling their fruits should have liberal supplies of liquid manure given at the roots, and the shoots should be kept well thinned and stopped. Shut up the houses, pits, and frames in which such plants are growing sufficiently early in the afternoon to raise the temperature to 90° with sun, affording plenty of atmospheric moisture at the same time. Put mats over plants growing in unheated pits and frames at night, and warm the pipes of houses so heated sufficiently to prevent the temperature in the same from falling below 70° or 65° between sunset and sunrise.

FIGS.

Houses in which the trees are swelling a second crop of fruit should be kept close and moist by syringing the trees morning and afternoon at closing time, when the temperature may be run up to 95° with sun-heat, and give adequate supplies of water at the roots when necessary. Houses in which the trees are ripening their crops should have abundance of fresh air admitted to them day and night on all favourable occasions. *H. W. Ward, Longford Castle.*

HARDY FRUIT GARDEN.

STRAWBERRY BEDS.

THE ground between the rows of plants which have finished fruiting should be cleared of weeds, and all useless runners removed. Old plantations of plants which have stood their allotted time and are worn out, should be grubbed up, the ground trenched and manured, and planted with some useful winter vegetable crops. This is a good time to thin out the crowns of plants, which are to remain to supply dessert fruit next year, removing the centre crowns, and leaving from four to six of the outer ones.

BUSH FRUITS.

Nets should be removed from the different quarters of black Currants, &c., as soon as the fruit is gathered, being careful not to store them until perfectly dry. Any weeds that may have accumulated between the bushes during the past busy time of fruit gathering and watering should be cleared off, and the quarters left tidy and clean. Young Currant trees which have grown strongly, and the shoots are too many to allow them to ripen thoroughly, should by all means be thinned out as early as possible, and if time can be spared they may with advantage be thinned to the extent that no further autumn or winter pruning will be required. In fact, these remarks apply with equal force to all kinds of bushes from which the fruit has been gathered. Red and white Currant trees may have nets placed over a limited number of bushes, with the view of keeping the fruit for a longer period of time. *G. H. Richards, Smerley, Kingwood.*

HEAT AS A STANDARD FOR COMPARISON WITH THE PROGRESS OF VEGETATION.—General Strachey has endeavoured to establish a simple method of computing the quantity of heat received at any place and proper to use as a standard for comparison with the progress of vegetation. Recognising the fact that it is not the absolute temperature that should be summed up from day to day for this purpose, but that it is the excess above a definite minimum, and that below this minimum active vegetative processes are not possible, General Strachey has endeavoured to establish the minimum limit, and to devise convenient methods for summing up the excess above it. Numerical tables are given to assist the computation. By assuming 42° Fahr. a base temperature, it results that a very close approximation is given by simply subtracting this figure from the true mean temperature on each pentade, and summing the remainders.

APPOINTMENTS FOR THE ENSUING WEEK.

		Royal Horticultural Society: Meetings of the Fruit and Floral Committees, at 11 A.M.; Show of Plants &c. City Cross Horticultural Society's Annual Show.
TUESDAY,	Aug 10	Sale of Dr. Mangray's Collection of Orchids, at Froehner & Morris' Rooms.
THURSDAY,	Aug 12	Sale of Orchids in Flower, and of Imports of Plants of Orchids, &c., at Stevens' Rooms.
FRIDAY,	Aug 13	Sale of Imports of Orchids from Mr. Sander, at Froehner & Morris' Rooms.
SATURDAY,	Aug 14	Sale of the First Consignment of Dutch Bulbs (listed to suit the Trade), at Stevens' Rooms.

IN endeavouring to discriminate between one plant and another, botanists make use of whatever "characters" may be available, recognising that some of these carry more weight than others. In pre-Darwinian days constancy or persistence was a point to which the greatest importance was attached, as indeed it is also now, but for a different and more philosophical reason. Certain characteristics, for instance, are or seem to be immutable, others are clearly variable according to circumstances. The latter furnish illustrations of the pliability of the plant, and its capacity for adaptation to different circumstances and conditions. These are the points the gardener consciously or unconsciously gets hold of, and by virtue of which he is enabled to select and develop tendencies according to his own will and pleasure. These physiological characteristics, in fact, are the great things for the cultivator to attend to.

The other relatively unchangeable characters are those most appreciated by systematic botanists, not only because they save much trouble and afford a comparatively secure basis for comparison, but also because—and here the Darwinian theory comes in—they afford evidence of the hereditary or congenital endowments which pass on from generation to generation unaffected, or relatively so, by variations in the kind or amount of nourishment and other circumstances. According to these views in studying the POTATO the botanist would lay much more stress upon the flowers and seeds than he would upon the haulm or the tuber, because both the latter, and especially the tuber, have been "selected" by man to suit his own purposes, and any tendency to change has been by him fostered and encouraged with the result that while there is infinite variety in haulm or tuber there is comparatively little in the flower, and the flower, therefore, is considered to afford better evidence than the tuber of the ancestry and genealogy of the Potato.

M. DE CANDOLLE, who has recently published some researches on this subject, points out that the Potato as cultivated differs from the plant figured by BAKER (*Journ. Lin. Soc.*, vol. xx., p. 489, &c.) in its sharply pointed, not obtuse calyx lobes. The difference, it will be seen, is of no direct cultural importance, but it may be of great significance as an indication of affinity. For these latter purposes attention should be given to those parts which man has had no interest in changing. The Potato of CLUSIUS and GERARD is, so far as foliage and flower go, the Potato of the present day; but who shall enumerate the varieties in the tuber that now exist or that have existed since the introduction of the tuber? To illustrate this point Messrs. SUTTON were good enough to forward some information which was communicated to M. DE CANDOLLE. In brief, Messrs. SUTTON declared that they had never in their vast experience seen a Potato with blunt calyx-lobes. We cannot follow M. DE CANDOLLE in all the details of his communication. It must suffice to say, that in his opinion *S. tuberosum* and *S. Maglia* are specifically the same, or rather of the species *tuberosum*. M. DE CANDOLLE admits four varieties—1, chiloense, from Chile, identical as to flowers with the cultivated form; 2, cultum, the cul-

tivated plant; 3, Sabini, which is the *Maglia* of HOOKER (*Bot. Mag.*, t. 6756); and 4, *Maglia*, from Chili, the plant of BAKER.

In addition M. DE CANDOLLE describes as a new species *S. Bridgesii* from Chili and to which he refers the *S. tuberosum* of BAKER's figure before cited; and another species, called *S. Mandoni*, from the mountains of Bolivia. It is admitted that the distinctions between these species are very slight and very inconstant, but that is the more reason why attention should be paid to the inherited characteristics which are not so much subjected to modification either naturally or by the hand of man. Potato growers would do a service, now that the Potatoes are in flower, if they would observe any variation in the form of the calyx from the ordinary sharply pointed lobes outside the blue or white corolla.

The returns of the Potato crop, which will be found in the previous pages, afford evidence of the damage resulting all over the kingdom from the excessive dryness of June and July. The quality of the early crops is generally good, if the produce be not over-abundant. Late and main crops promise well should the late rains have been generally distributed, and no disease should appear. It is a singular fact, and one pointing to the low average temperatures of the present summer, that Potatoes suffered slightly from frost in July in Ross-shire.

— PRIZE ESSAY ON ROOTS.—Next week we intend to publish Mr. P. SEWELL'S essay on "Roots and their Work." It is the essay which obtained the First Prize in the recent competition among young gardeners, and will be illustrated.

— DENDROBIUM STRATIOTES.—We are indebted to the Compagnie Continentale of Ghent for the opportunity of having this very remarkable and very attractive Orchid (fig. 34). The Director has also obligingly furnished us with flowers, which have enabled us to examine their singular structure. The figure supplies an explanation of the name attributed to the species by FROT REICHENBACH. The "soldier" Dendrobe, in fact, with its mass of erect pseudobulbs, resembles a company of soldiers, the position of the petals, now erect, at other times directed forward, resembling their bayonets in various positions. The plant was described in our columns by Prof. REICHENBACH (p. 265, vol. xxv.), and a coloured figure has been given in the *Lindena*, p. 91, so that any further technical description is unnecessary. Connoisseurs will appreciate the plant for the singularity of its habit and the profusion and beauty of the flowers, whose "scheme of colour," ivory-white in the sepals, pale green in the petals, with the rich violet venation of the lip is sure to attract attention. The plant is a native of the Sonda Isles, whence it was sent by MM. AUGUSTE LINDEN and AUGUSTE DE RONNE. As is the case with most Orchids, the flower of this *Dendrobium* is specially modified for cross-fertilisation by insect agency. The sepals and petals are so many banners hung out to attract attention; the lip is like the alighting-board of a bee. Once alighted on the convenient landing-stage so provided, the insect is probably beguiled by the smell of honey in the spur, and is directed in the way he should go to get it by the purple guiding lines of the lip, and especially by the tunnel-like basal part of the lip with the groove on the floor, compelling the insect to keep the track, and in so doing necessitating the contact of his head or thorax with the anther. This effected the insect riles the honey, probably all unconscious that he is being made a tool of by the flower.

— "MALPIGHIA."—The publication of a new botanical journal is announced under the above title. The new botanical review will be edited by Professors BONZI, PENZIO, and FROTTA, and published by Messrs. GARTANO, CAPRA & Co., of Messina. Original articles, bibliographical information, critical notes, botanical notes and queries, after the pattern of *Notes and Queries*, will be given. The annual subscription for twelve monthly numbers is 25 francs (£4). Separate numbers will not be sold.

— PORTUGUESE CISTI.—In speaking lately of the monograph of these beautiful plants lately issued in the *Bollettin de Soc. Botriana*, we attributed, in the absence of any indication, the authorship to the Editor. Professor HENRIQUES, however, writes that the work is due to M. J. DAVEAU, the Curator of the Lisbon Botanic Gardens.

— REVIVAL OF THE HOLLYHOCK.—In the interests of horticulture we are glad to know that Mr. BLUNDELL, The Nurseries, West Dulwich, has preserved some of the best varieties of CHATER'S and LAING'S Hollyhock flowers, which have long been absent from most gardens, owing to a fungous disease that almost swept them off the face of the earth. The blooms sent us were of fine form, from a florist's point of view, and the colours very pleasing; the foliage, too, is clean and healthy.

— THE HOEBURG GARTEN IN VIENNA.—The post of Hofburg Garten Inspector, rendered vacant by the death of FRANZ ANTOINE, has been conferred on Herr FRANZ MALY, the Curator of the Flora Austriaca, otherwise Arboretum Hostii, at the Schloss Belvedere. This collection of living specimens of all the plants of Austria is unique in the country.

— PURVEYOR OF BULBS TO THE ROYAL PARKS.—We understand that Her Majesty's Commissioners of Works have accepted the tender of Mr. B. S. WILLIAMS, Victoria and Paradise Nurseries, Upper Holloway, for supplying Hyacinths, Tulips, Crocus, Daffodils, &c., for the following Royal Parks, &c.:—Hyde Park, Regent's Park, Victoria Park, Bethnal Green Museum, Battersea Park, Kennington Park, and Hampton Court Gardens.

— DR. HANCE.—With much concern we learn from the *Journal of Botany* of the death at Canton of this learned and acute botanist. No one was better acquainted than he with the flora of China, nor published more to the purpose concerning it. We had occasion from time to time to consult him upon Chinese trees and other plants in the interests of the readers of this journal, and always received replies as full of information as they were courteous in tone. Dr. HANCE had been in ill-health for some months, so that his death will not come as a surprise, but it is not easy to see how the void in the department of botanical work which he made his own is to be filled up. Dr. HANCE was for many years Consul or Vice-Consul at Whampoa.

— COMMEMORATIVE TREES—A SUGGESTION.—A correspondent of the *Gardener's Magazine* makes the following excellent suggestion, which we hope will be followed out, and moreover we trust that the Victoria jubilee will be celebrated in like manner, by the formation of memorial groups, and by the planting of barren hillsides and other suitable localities, where shelter, beauty, and profit may be judiciously combined with historic associations:—"Seventy-six years ago was celebrated the jubilee of King GEORGE III. On that occasion, and at the coronation of Queen VICTORIA, in 1838, the jubilee of which is approaching, many commemorative trees were planted in public and private grounds in all parts of the kingdom. It has struck me that it would be interesting to collect information respecting the present condition of such of these trees as are now worth notice. Brief records of their present state, accompanied by a few simple measurements on some uniform plan, would possess practical value and interest for the arboriculturists of the present and still more those of the future."

— INSECT KILLING BOTTLES.—Mr. RICHARD BREMIDGE, Registrar of the Pharmaceutical Society of Great Britain, has forwarded to us the following note with the request that we should call attention to the circumstances:—"The public danger arising from the sale of insect-killing bottles containing cyanide of potassium by naturalists and other persons not registered as chemists and druggists, and without compliance with other provisions of the Pharmacy Act, 1868, has recently been brought under the notice of the Council of this Society, and I have been instructed to call the immediate attention of such persons to the fact that the sale of these insect killing bottles by them is contrary to the provisions of the

FIG. 34.—*DENDROBIUM STRATIOTES*: FLOWERS CREAM-COLOURED, PETALS GREENISH, LIP WITH VIOLET STREAKS. (SEE P. 176.)

above-mentioned Act of Parliament, and that the penalty to which they render themselves liable is £5 for every sale."

— THE OXFORD CARNATION AND PICOTEER UNION.—The second gathering of the Union at Oxford on Tuesday last proved quite as successful as the first; the day was beautifully fine, the flowers were seen to the best advantage, and a large number of visitors, rich and poor alike, who had free access to the gardens, came to inspect the "feast;" among them the Mayor and Mayoress of Oxford, both being present at the luncheon afterwards in the hall of Cowley St. John's High School, where from sixty to seventy persons being present. The Mayor of Oxford occupied the chair, Mr. SHIRLEY HIBBERD and Mr. RIFTON, Editor of the *Oxford Times*, being in the vice-chairs. The post-prandial proceedings were of an interesting character. The Mayor made an excellent chairman, and Mr. SHIRLEY HIBBERD was especially felicitous, particularly so in response to the toast of the horticultural and local Press, in which he traced the history of the horticultural Press to the present day. A great number of the floral fraternity attended from various parts of the country.

— "THE SKELETON IN THE CUPBOARD."—Under this title Dr. RICHARDSON, in the remarkably instructive periodical the *Aseclapia*, which he writes and edits single-handed, calls attention to our national food supply, and to the serious consequences that would ensue if from war or other causes that supply were cut off. As a physician he "stands appalled at the insanity of luxury that he witnesses by the side of the awful destitution to which the luxury is bound hand and foot in common peril. We are living as if we had in the country at least a year's store of food in reserve, while in fact we may not have a week's." Dr. RICHARDSON then proceeds to enquire how far by cultivation, economy, husbandry, and skill we can prevent the necessity of importing food for the healthy maintenance of the people of these islands. Admitting that this is nowadays impossible as a whole, there is no question that much might be done to increase our homegrown food supplies by reclamation of waste lands, improved land laws, economy in production, increased use of labour-saving machinery, prevention of waste especially the colossal waste of sewage, and the hardly less wasteful consumption of alcoholic drinks in excess, and the development of habits of thrift.

— LAWN AND GARDEN APPARATUS.—Messrs. MERRYWEATHER & SONS, the originators of the famed "antimoonial" garden hose, which has gained a character for strength and long usage during the last nine years, have made for Baron ROTHSCHILD a new lawn and garden apparatus, after the Paris system, with various improvements.

— THE GARDENS OF OLYMPIA.—An important additional feature has been added to the New National Agricultural Hall, the great enterprise at Kensington, which will be popularly known as "Olympia." The Directors, of which the Earl of LATHOM is Chairman, and Sir JOHN HUMPHREYS the Deputy-Chairman, have made a purchase of land adjoining their present estate, with the intention of transforming it into a garden, where the people, after the close of the Colonial Exhibition, may continue to enjoy music and accompanying pleasures in the open air. The company now possesses 12 acres of land of great value, 4 acres of which is being covered with buildings, while there will be 8 acres of open ground available for recreation.

— FELTHAM HORTICULTURAL SOCIETY.—The seventh annual exhibition of this Society took place on the 28th ult., and may be regarded as in every way a gratifying success, flowers, fruit, and vegetables being shown somewhat extensively, and in capital condition. Conspicuous features in the exhibition were magnificent non-competitive groups of hardy trees and shrubs, choice stove and greenhouse plants and cut roses, from the branch nurseries of Messrs. CHARLES LEE & SON, Isleworth and Feltham. Mr. H. WILHELM, Springfield Nursery, Sanbury, put up a splendid lot of Carnations and Picotees, not for competition, which took the fancy of the numerous visitors. Mr. COLE, The Vineyard, Feltham, staged a neat group of flowering plants, tastefully interspersed with Maidenhair Ferns, and that successful

vegetable exhibitor this season, Mr. C. J. WAITE, Glenhurst Gardens, Esher, gained the "Open to All England" prize for the best collection of vegetables, eight distinct kinds—a very creditable lot. A very fine collection of vegetables, sent by Mr. POPE, gardener to the Right Hon. the Earl of CARNARVON, Highclere Castle, Newbury, arrived too late for competition, but was deservedly awarded an extra prize.

— THE SOCIETY OF AMERICAN FLORISTS.—The second annual meeting will be held at Philadelphia from August 18 to 20 when the following interesting papers will be read before the meeting:—

"What the craft has been doing the past forty years." Peter Henderson, Jersey City.

"Treatment of Tea Roses during the summer," with list of best budding varieties. Antoine Winter, West Grove, Pa.

"H.P. Roses for outdoor summer bloom," with list of best varieties. John Henderson, Flushing, L.I.

"Pot-grown Roses for market purposes, their care and treatment." Robert Craig, Philadelphia.

"Fungoid diseases of the Rose." H. J. Sackerdorff, Bysside, N.Y.

"Model greenhouses and how to build them." John N. May, Summit, N.J.

Report of Hail Committee and discussion of the subject.

"The advantages of hot water over steam for heating purposes." J. D. Carmody, Evansville, Ind.

"The advantages of steam over hot water for heating purposes." J. H. Taylor, Bay-side, N.Y.

"How to build a flue." Wm. Hamilton, Allegheny, Pa.

"Pot-grown decorative foliage plants for general purposes." James Taplin, Maywood, N.J.

"Carnations and their treatment." Joseph Taily, Wellesley, Mass.

"The making-up of floral designs in the most effective manner, and suggestions for developing the best taste." A. Le Mont, New York city. (Mr. Le Mont will illustrate his paper with actual work on the stage, with fresh flowers supplied by the Philadelphia florists.)

Exhibits of greenhouse appliances, such as boilers, ventilating apparatus, hose, pots, building materials, &c., are solicited; also florists' requisites, and articles employed in the arrangement of cut flowers are desired. It is not the intention to have a regular exhibit of plants, but the executive committee request that all persons having novelties, or scarce and rare plants, should exhibit them. The committee on nomenclature of plants, appointed at the last meeting of the society will pass judgment and award certificates to deserving plants.

— AN EARLY FLOWERING CROCUS.—The beautiful Caucasian species, *Crocus Scharojani*, is the first of all to flower after its summer rest. On July 25 the buds were appearing above-ground in the *Crocus* collection at Kew, and a week later (August 1), six of the large orange-yellow flowers were expanded, and formed quite an interesting little clump. The species possesses a double interest, for besides its early flowering, it is the only yellow autumn-flowering species, the other yellow-flowered species not appearing till the spring. At present it is rather scarce, but in course of time it will probably become more common, not only on account of its singularity, but because of its beauty.

— ARISEMA LAMINATUM.—A coloured plate of this small but extremely pretty and interesting species is given in BLUME'S *Rumphia*, tome i., t. 27, and an analysis of the flowers and organs of fructification, uncoloured, at t. 37. The plant is dioecious, and occurs, but not very plentifully, in primeval forests in the western regions of Java, where it flowers in June. It was received at Kew from Glasnevin about two years ago, and flowers in May in a stove temperature. In the coloured plate above mentioned the male and female plants are figured furnished only with a single leaf each, but those at Kew have a pair of leaves, and each generally with three more or less perfect leaflets. The male plant is the smaller, and, excepting the organs of fructification, both are otherwise exactly similar. The most interesting feature lies in the tri- or quadri-coloured spathe. The closed and tubular part surrounding the inflorescence is of a creamy-white colour, mottled or streaked with faint brown and purple markings, while the ovate acuminate lamina is of a deep shining green, and distinctly separated from the white tube by a transverse deep purple band. The disagreeable odour emanating

from some members of this genus does not seem to occur here. Both in the genus *Ariseema* and in many other members of the same family the fetid odour as of putrifying flesh seems to be connected with those species having a lurid red or brownish-red spathe. A speciosum, *Amorphophallus campanulatus*, *Typhonium divaricatum*, and the *Saurontomas* may be mentioned as familiar and well known examples.

— NEW ZEALAND.—Our New Zealand exchanges are full of the details of the great volcanic catastrophe which has destroyed a native village, and covered the land with mud and stones to a depth in some places of 30 feet. The outbreak occurred on June 10 on Mount Tarawera, close to Lake Rotomahama. Dr. HECTOR proceeded at once to the scene of disaster, and from him we may look for a valuable account of the effects of the catastrophe. About 100 natives and fourteen Europeans have perished, and the peculiar terraces described as the "wonder land of the Pacific," and alluded to as conveying a sense of supernatural loveliness by FROUDE in his *Oceana*, have been destroyed.

— A MONSTROUS BEGONIA.—Nature frequently reveals the secrets of her handiwork by freaks and irregularities, which we generally regard as sports or monstrosities. A double-flowered variety of the tuberos-rooted section of *Begonia* grown at Gunnersbury Park under the name Jules Sequin, exhibits a most singular doubling of the female flower. Usually doubling is brought about by the stamens of the male flower becoming petaloid while the female flower in the same plant is normal; but in this instance the usually inferior trigonous ovary is absent. There is, further, a perfect separation and a great duplication of the carpellary leaves, which in normal flowers are only three in number. Many of these are tipped by more or less fragrant or perfect stigmas, while their edges on the lower half are covered with two broad almost confluent bands of white granular matter. These two bands correspond to the placentas on the margins of open carpels, and a microscopic examination of the white granular matter shows the latter to consist of a dense mass of apparently perfectly formed reticulated and anatropous ovules, each with a very short funiculus, and attached to ridges or shallow plates running longitudinally, and covering the broad placentas. The latter are very broad in the normally formed fruit. All these characters speak plainly for themselves, and evidently demonstrate the foliar origin of the carpels composing the fruit of flowering plants. They are petaloid, and highly coloured in this instance, but there are cases in other plants of their becoming green and foliaceous.

— M. MALOU.—Our excellent colleagues of the Belgian horticultural Press are bemoaning the loss of M. JULES MALOU, whose name is not wholly unfamiliar in this country as a politician. Few, however, were aware that M. MALOU sought solace from the worries and labours of party politics in the practice of horticulture. M. MALOU was, it seems, ardently attached to gardening pursuits, and conducted in his park experiments on acclimation, and, to use the words of Count KERCHOVE, was as earnest in his endeavours to inspire admiration for a new plant as to convert a political adversary. The Minister might often be seen in the lobbies of the Parliament house extracting from his pocket seeds, and even Potatoes, like *Magnum Bonum* and *White Elephant*, and descending upon their merits and their utility in increasing the food-resources of the country. M. MALOU became President of the *Compagnie Continentale d'Horticulture*, and thus in various ways contributed to the development of horticultural progress and the welfare of his country. When inquiry is made in the future as to the person commemorated in *Cattleya Malouana* and *Labisia Malouana*, the reply will be that the names commemorate a Belgian statesman far-sighted enough to see that the national welfare did not wholly depend on the debates and disputes of party politics, but on the more practical development of good cultivation and improved material.

— ERINEUM ON THE FLOWERS OF THE VINE.—M. J. E. FLANCHON, in the last number of *La Tige Americaine*, calls attention to the presence of *Erineum* on Vine flowers. M. FLANCHON says that *Erineum* is usually found on the inferior surface of the leaves, but nevertheless sometimes it is met with on the upper surface, where in spring it is troublesome,

but almost harmless in summer, because of the rapid growth of the leaf. The Eriueum would be most hurtful on the flowers of the Vine, where it has been observed at Joigny (Yonne) by M. Eug. Benoit, and at Beaune (Côte-d'Or) by M. J. Ricaud. M. Benoit intends to lay his note of observations before the Société de Paris, but he has communicated it in MS., with specimens, to M. GUSTAVE PLANCHON. M. RICAUD has kindly sent some parts (main axis, secondary branches, and the pedicels) bearing the Eriueum. Although the presence of Eriueum on the bunches may do no great damage, it may still have an influence on the crop.

— **MACROSCHEPIS OBOVATA.**—Like many other forest and tropical Asclepiads this tall twiner is able to subsist by supporting itself on neighbouring vegetation, and so obtaining a due share of necessary light. The most striking feature of the stems and leaves is the bearded or villous appearance presented by the copious long brown hairs with which they are clothed, recalling that of *Ficus barbata*, with similarly extensible stems, scandent habit, and dense covering of rusty hairs. The flattened or expanded flowers are produced in axillary cymes, and are of a peculiar deep shining brown. Their glossy appearance is not well represented in the *Botanical Magazine*, t. 6815, although the other characters, structural and otherwise, are clearly enough defined. The leaves are obovate, as the name implies, but owing to a slight constriction above the base they present a panduriform or fiddle-shaped appearance to some extent. A small plant flowered recently in the Palm-house at Kew, where it is planted out in a narrow border, and allowed plenty of head room on wires running upwards and parallel under the curvilinear glass roof. The plant enjoys a rather extensive distribution in the tropical parts of America from Mexico to Peru, having been picked up by several collectors, but, like many others of its allies whose flowers prove of but little attraction to the general public, it is probably not destined to enjoy great popularity. They are, however, of great interest and curiosity, while they are also comparatively large for the order.

— **ONCIDIUM MACULATUM.**—A form of this extremely variable species has been flowering for some considerable time in the cool Orchid-house at Kew. The specimen has a simply racemose inflorescence, but the typical form figured in the *Sertum Orchidaceum*, t. 25, exhibits a paniced inflorescence or compound raceme. The variety under notice agrees in structure with that figured in the *Botanical Magazine*, t. 3836, under the name of *Cyrtorchilum maculatum* var. *cornutum*, the varietal name being derived from the absence of two horn-like processes of the crest, that are characteristic of the type. The colour, however, in the figures above quoted consists of a greenish-yellow heavily spotted with deep brown, while in this instance the sepals and petals are of a uniform deep shining chocolate-brown, with the exception of a few transverse yellow bars and a yellow tip. The labellum is white with a large pale brown blotch about the middle. A singular monstrosity is exhibited by one flower possessing two perfect labella, four sepals, and the two pollinia rather distantly separated, each possessing a pedicel and gland instead of both being fixed to one pedicel and gland. Several varieties of the species have been recorded under the old generic name *Cyrtorchilum*, the species of which have with few exceptions been included under two of the groups of *Oncidium* by the *Genera Plantarum*. The form under notice is less attractive than the type and those possessing more distinctly maculated flowers, and its value is also greatly increased when the inflorescence is paniced—a condition most prevalent amongst the species of *Cyrtorchilum*.

— **BUDDLEA CURVIFLORA.**—Excepting *B. globosa* none of the species have become widely disseminated in British gardens—a fact easily accounted for by their not being sufficiently hardy to withstand our climate unprotected. The species under notice is said to be hardy, and should it ultimately prove so after being thoroughly tested in different parts of the country, it would be a decided acquisition for our shrubberies. The individual flowers are small and rusby-lilac, but produced in dense terminal spikes, 4–6 or more inches in length, which arch or curve in a graceful manner, suggestive of the specific name. There is a figure of the plant in the *Illustration Hor-*

ticole, xvii., pl. 25, which represents the species with tolerable exactitude in all save the graceful curve of the branch bearing the inflorescence. This is straight in the plate, giving the inflorescence a rigid and unnatural appearance. A small circular bed on the grass in the botanic gardens, Kew, has been gay for some time, and seems likely to last for a long time yet. It is totally different from all other kinds of shrubby vegetation flowering at present, later and altogether distinct in appearance from the well known globose heads and orange flowers of *Buddlea globosa*. The leaves, the small tubular flowers and their densely cymose or pseudo-verticillate arrangement forcibly reminds one of a Labiate, although the structure, especially of the fruit, is very different.

— **GRIFFINIA ELUMENAVIA.**—In this genus we have a departure from the generally prevalent type of foliage in the order, and which (department) is also well represented in *Eucharis*. The leaves are broad and contracted into a distinct, sometimes elongated, petiole, and the longitudinal nerves are connected by smaller, more or less distinct transverse ones. *G. Blumecaviva*, however, departs in several particulars from the originally described type to which its congeners conform. In the first place the leaves are narrow, oblong-lanceolate, and very shortly petiolate; and secondly, the stamens are all equally declinate, although of unequal lengths, while in the type one stamen rises up away from the rest. Curiously enough, the lower segment of the perianth is pure white, while the other five are more or less suffused and transversely banded with a delicate rose colour. The transverse lines correspond to the venation, which in this respect recalls the venation of the foliage. Furthermore, it is a highly attractive species, resembling an *Amaryllis*, of low stature and accommodating dimensions. The flower-spice does not exceed 6 or 8 inches in height, bearing four to eight flowers in an umbel. It flowered recently in the Begonia stove at Kew, where it proved a highly attractive and delicately coloured species. Its popularity is also attested by it having been figured in several gardening and botanical works, amongst which is the figure in the *Botanical Magazine*, t. 5666, and that in the *Gardeners' Chronicle*, 1871, p. 711. The seven or eight known species are all Brazilian.

— **CALANTHE VERSICOLOR.**—Last year a species of *Calanthe* from King William's Town flowered at Kew and was described in the *Gardeners' Chronicle*, xiv., p. 78, under the name of *C. natalensis*, and was said to be flowering, probably for the first time in Europe. There is little doubt it is identical with the description of *C. natalensis* as described by REICHENBACH in *Bonplandia*, 1856, p. 322. It is also identical with a more minute description of *C. versicolor*, given by LINDLEY in the *Sertum Orchidaceum*, where it is also figured, t. 42. Gardening books record it as having been introduced in 1836 from the Mauritius, while LINDLEY states it to be a native of the East Indies, sent from the Calcutta Botanic Gardens to the Horticultural Society. It flowered at Syon House in September, 1840. LINDLEY's name ought therefore to have the right of priority. A figure in the *Botanical Magazine*, t. 6844, under the name of *C. natalensis*, is almost identical in every point with LINDLEY's figure above quoted. The most noticeable difference in the colour is that of the labellum when it fades, but that might be owing to the age of the flower when painted, or to the difficulty the artist might have had in reproducing the colour exactly. The difference, however, is so very slight that there is not the least importance attached. The description in two of the cases above cited says the peduncle is pubescent all over on the upper part, but a close inspection of the living plant shows it to be pubescent to the base, or nearly so, with the hairs only shorter and less conspicuous, but quite evident. LINDLEY's figure and description was published in 1841, and consequently had the priority by fifteen years over the description in *Bonplandia*.

— **PUBLICATIONS RECEIVED.**—*Department of Agriculture (Canada): Report of the Entomologist.* By J. FLETCHER, F.R.S.C. 1885.—*The Asclepiad.* By B. W. RICHARDSON, M.D., F.R.S. (London: LONGMANS, GREEN & Co.)—*Chambre Syndicale des Horticulteurs Belges, Gand: Rapport Annuel, 1885*

(Gand: C. ANNOOT-DRAECKMAN, AD. HOSTE SUCCESSEUR).

— **GARDENING APPOINTMENT.**—Mr. WM. LEIGHTON has been appointed Head Gardener to Mrs. BROMLEY, Mansion House, Stone, Staffordshire.

Notices of Books.

Rus in Urbe: or, Flowers that Thrive in London Gardens and Smoky Towns. By Mrs. HAWES. Illustrated. London: Field & Tuer, The Leadenhall Press, E. C.

This quaintly-bound little volume contains many useful hints for those who are compelled to live in densely populated localities, and yet love a garden, or something that reminds them of one. Mrs. HAWES shows that some plants will grow everywhere, and many will thrive and flourish well, if due attention and care are bestowed on them, according to their requirements. Mrs. HAWES not only discourses upon plants and how to grow them, but gives some hints also as to their arrangement for decorative purposes. We quite agree with her in her remarks about the white Lily, which in a giant form has lately become fashionable. "A flower too strong in scent," says Mrs. HAWES, "ought not to be used in quantities; better choose another class of white blossom—there are any amount, Heaven knows!—rather than nip off the golden pistils (*stamens*) which make half the beauty of the flower. To one who loves flowers the impression is as disagreeable as the sight of a woman with her nose removed; and at a dinner-table the imprisonment is long with the horrid object. This is an instance of complete want of 'taste,' discrimination, and feeling for beauty." Mrs. HAWES also discourses on the arrangement and use of flowers in rooms, and for personal adornment, and she suggests a spray of *Laurustinus* as a useful and pretty flower for the hair. We quite agree with Mrs. HAWES. One of the prettiest wreaths of the kind we ever saw was composed of *Laurustinus*.

Mrs. HAWES names many homely and easily obtained plants and leaves useful for decorative purposes, amongst them Oats and sprouting Wheat. We may add to these Carrot leaves and Asparagus, the crimson berries of which are very ornamental.

We cannot praise the illustrations in this little volume; they are hard and crude, and not distinguished by the grace or elegance possessed by the plants they represent. The list of plants also should be corrected in the next edition. It is too full of printer's errors.

Those, however, who wish to add interest to a city life may with advantage consult this little book, and will find the light and pleasant style in which it is written help to wile away an hour, and perchance they may be reminded of homely plants and flowers they knew long ago which might thrive in their city home with care and attention, and surely only the attempt to grow a few flowers (or even leaves) is full of interest and pleasure for him who attempts it!

COLUMBIAN PLANTS.

WHILE travelling in the United State of Columbia I found, amongst thousands of fine and desirable plants, two which I tried unsuccessfully to introduce to our gardens. On my return I gave the necessary indications to my friends, Mr. Linden and Messrs. Veitch; but as they did not succeed, and have not for the moment the intention to send there any collectors, and on the other hand, as I have heard that in one of the localities at least extensive clearings are taking place, I am afraid the plants may be lost by further delay. I will try to put collectors on the scent, and amongst them the two who advertised lately in your columns.

I. In crossing the *Quindío* range from Ibague to Cartago, a little above El Toche, amongst the first or lower clumps of *Ceroxylon andicola*, which are here interspersed with a fine *Chamedorea*, I found an epiphyte the most beautiful by far of all the *Bromelias* I ever saw; and what adds to its value as a garden plant is its habitat in such a cold climate; a *Masdevallia*-house will probably be sufficient for it. It lasts in full beauty certainly for more than a month. Description.—Plant the size and shape of *Bil-*

bergia thyrsoides. Spike branching in a fine pyramid, but gracefully inclined from half its height, which would be 2 feet long if erect; at the base of each branch is a large open bract, diminishing at each stage; flowers like those of *Echmea fulgens* in size and shape, or a little larger, white. Fruit a triangular capsule, seeds, silky, as in *Vriesea* or *Guzmania*; the whole inflorescence, stem, bracts, branches, and calyx, translucent as wax and of the brightest golden colour, or rather orange. Is not that glorious?

Below that spot I noticed a fine variety of *Brugmansia suaveolens*, of a true nankin colour, growing amongst a whole copse of the type, but scarce. In the neighbourhood plenty of *Orchids*, *Odontoglossum*, *Stanhopea*, *Houlletia*, *Trichopilia*; they were not in blossom on my passage (end of May), and besides as they grow in the crown of the trees it is difficult to see them, even with a spy-glass, at 60 feet and more above-ground. The only chance is to arrive at the spot while a clearing is going on; then shiploads might be gathered on a few square rods.

The *Bromelia* grows at a higher altitude than *Brugmansia* and *Lycium fuchsoides*, of which latter fine plant I have given a live specimen to Kew.

2. On the northern entrance to Pasto in a hollow road, just in the suburb, I saw a fine Passion-flower, bright scarlet with a black crown. Its beauty consists in its free flowering, the shortness of branches (3 or 4 yards at the utmost), its cold habitat amongst the *Brugmansia sanguinea*; (local name *oando*), a native of the place; its fruits are like Gooseberries. The nearest approach to the *Bromelia* I recommend is a very inconspicuous, not to say ugly plant of the same genus I saw exposed this spring in Brussels, under the name of *Calopsis paniculata*, *Jean van Volxem, Brussels*. [The plant correctly so named, is a *Kestiad*, of rather elegant appearance. ED.]

FORESTRY.

PROPAGATION.

CUTTINGS of the Laurel, Bay, Box, Privet, Holly, Yew, and Laurustinus may now be put in, as it is found that root formation is more rapid during the present month, when the earth and air are more of an equal temperature than at any other time of the year. The cuttings should be made of the present year's shoots, with about an inch—a "heel"—of old or last year's wood, and about 9 inches in length. Insert them in the ground from 5 to 6 inches, and pack them so thickly in the lines that they will be touching each other. Well worked soil of a free, sandy nature should be chosen in which to plant cuttings, and where the latter quality is deficient the addition of a little sharp river sand will be found of great advantage in hastening the formation of rootlets.

Towards the end of the month cuttings of the rare and more desirable *Conifers* should be inserted as follows:—Cutting-boxes made of ordinary deal wood—the most convenient size we find to be 2 feet long, by 18 inches wide, by 15 inches deep, and made of inch thick wood—should be filled to within an inch of the top with fibrous loam and leaf-mould in about equal proportions and one-fourth of fine sharp sand; the whole mixed well together and pressed firmly down. Insert the cuttings 3 inches in the soil, and at a distance of 3 inches apart, and sprinkle over the surface a slight coating of finely powdered sand. Place the boxes in an unheated frame, and shade from direct sunshine for a month, attending with a moderate supply of fresh soft water, when the condition of the soil suggests that such is necessary.

In this way many of our rarest and most valuable *Conifers* have here been raised, including such choice subjects as *Fitzroya patagonica*, *Thuopsis dolabrata*, *Juniperus recurva*, *Cephalotaxus pedunculata*, *Retinosporas* of all kinds; *Lilodocerus tetragona*, *Podocarpus koraiensis*, *Cypripedium*, of sorts, and many others. Some persons are not in favour of raising *Conifers* from cuttings, but we have found it to answer well here, and have found the produce to be even superior to plants so raised in the woods and grounds than such plants as have been raised from seed.

Layering from old stools, whether in the woodland or nursery, should, likewise, receive immediate attention as this is both a quick and inexpensive method of extending game covers, or obtaining an immediate

supply of young stock in the nursery. Fork the ground around the stools well over; bend down the strongest shoots in a circle around the parent stem, and fasten each one to the soil with a stout hooked peg. To hasten the formation of roots take a spadeful of soil on that portion of the bent branch where it comes in contact with the ground. The extension of game covers is gone about in a similar manner, only it may not be found at all times necessary to loosen the soil around the parent plants nor to have the layers pegged down in a circle around the stem. Remove superfluous shoots from the stem after a sufficient number has been layered, leaving just enough for a similar course of treatment next year, thus imparting extra vigour to the remaining ones. *A. D. Webster, Penryn Castle, Bangor.*

The Apiary.

TAKING OUT FRAMES, &c.

I PROMISED in my last to say a little on this subject. It will soon be a proper time to take the honey; it is useless to delay doing this till the end of September. It is well at once to decide how many stocks you are going to keep all the winter, for though you need not kill any of the bees, yet it is not necessary to winter them all in separate hives, especially if

FIG. 35.—MESSRS. EDEY'S EXTRACTOR.

they are weak. Suppose you have twelve hives, and only want six, bring them closer together, a little every day in pairs, you can then take all the honey out of six hives, and give the bees to their nearest neighbours. Before doing this, smoke both hives well, and if they fight, smoke them again and again. The queens will be sure to fight; never mind that, it will ensure "the survival of the fittest." Take out the frames carefully and without jarring; shake the bees off, and sweep off the remainder with a goose-quill, or better still, a *Yucca* brush. The latter is eminently suitable, as (being so soft) it does not irritate the bees; it is the product of a plant which grows in Southern California. In all these operations, I would advise the use of a veil and gloves, especially the veil. The temper of bees can never be known in advance, and after reading about the death of the ex-mayor of Ludlow by his own bees, we are more than ever convinced, that "discretion is the better part of valour."

A very useful possession is the extractor, and I would call attention to one invented and manufactured by Messrs. Edey & Son, of St. Neot's, and which is here illustrated (fig. 35). The inventors acted on the principle of making a machine of as few parts as possible, for the fewer parts there are to a machine the less liable it is to get out of order, and the easier it is to mend when it is out of order. This machine is entirely different in design to any other machine in the market. The ordinary cylindrical extractor is a rather cumbersome and expensive thing, but here is one which answers every purpose, and is just about one-half the price of the ordinary extractor. The illustration shows how it is worked. It revolves

two combs at once, which is quite sufficient work for most people. The honey is emptied by a valve at the foot, which, however, is not shown in the illustration. I have gone rather fully into this, because there are many people who avoid the modern system of keeping bees, not so much because they do not believe in it, but because there seem to be so many expensive articles required. *Walter Chitty, Peasey.*

SANDAL WOOD.*

THE true Sandal-wood tree is a native of the mountainous parts of India, but is found more especially in the Mysore and Coimbatore, extending northwards into Canara. It likewise grows on the Coromandel coast, in Madura, Assam, and Cochinchina (?). As a garden plant it appears as far north as Saharunpore. The same tree (or a variety) is met with in several islands of the Eastern Archipelago, namely, Eastern Java, Sumba, Timor, and probably others. In India the natural habitat of the tree is said to have been reduced by cultivation,† and it is now raised, principally from seed, in Government plantations in the Madras Presidency and the Mysore.

Sandal wood is yielded by other plants of the Santalaceae. In the Fiji Islands it is obtained from *S. Yasi*, Seemann, *S. Sphyralium*, *A. Gray*; and *S. Freycinetianum*, Gaudichaud, furnish a supply in the Sandwich Islands; in New Caledonia *S. Austro-Caledonicum*, Vieillard; in Western Australia *Fusanus spicatus*, Brown (*S. spicatum*, DC., and *S. cygnorum*, Miquel); in Tahiti *S. insulare*, Bertero. An inferior kind has been met with in the Percy Isles, Repulse Bay, Cape Upstart, and the Palm Islands; it is the wood of *Exocarpus latifolia*, R. Brown.‡ The wood of *Plumeria alba*, belonging to the Apocynaceae, is sometimes substituted for Sandal wood. Balfour also states that a white Sandal wood, called Lava, or Lawa, is imported from Zanzibar into Bombay.§

When the Sandal-wood trees have reached perfection, which they do in from twenty to thirty years, having then a diameter of from 9 to 12 inches just above the root, at the end of the year they are either cut down or dug up; if the former, the roots are generally dug up afterwards. Worthless branches are removed, as is also the bark if the work is done properly, and the trunk is buried for six or eight weeks, sometimes left lying on the ground, in order that the white ants may eat off the inodorous sap-wood. It is then taken up and sent to the depôts, where it is sorted into three kinds. Concerning the sorting, Buchanan says:—"The deeper the colour the higher the perfume, hence the merchants sometimes divide Sandal wood into red, yellow, and white; but these are only different shades of the same colour, and do not arise from any difference of species." He distinctly implies that the three kinds are derived from the heart-wood. To the same effect is the following statement by Udoy Chand Dutt¶, when writing of white and yellow Sandal wood:—"These varieties are founded on the difference in depth of colour of the heart-wood." From this it appears that the statement which has been made by some writers, that white Sandal wood is the sapwood of *S. album*, is, to say the least, somewhat misleading. The sapwood is, nevertheless, found in commerce, for Balfour** describes it as "cont'd with thick compact bark, has a grey and brownish epidermis, it is nearly inodorous, and has a slightly bitter taste." As the white is doubtless a lighter shade of the yellow, so is the red (apart from that obtained from *Pterocarpus santalinus*, which is truly red) a deeper shade. The red kind was not recognised in Sanskrit medical works, the only kinds mentioned being *Srikhandia*, or white Sandal wood, and *Pitchadana*, or yellow Sandal wood. When the wood has reached the depôts it is cut into billets from 2 to 4 feet long. In cutting down the trees the earth is removed from about the root, so that the collectors may cut as low as possible. The billet taken from the trunk immediately above the root is called the root-billet, and is of superior quality.

The tree grows freely in hedges and gardens, and

** *Op. cit.*

in a rich soil attains its full size; but in such localities the timber is of little value, and has scarcely any smell. Soil and elevation have great influence on the amount of oil produced. It thrives up to an elevation of 4000 feet, and yields the largest quantity of oil when grown in dry, sunny, rocky, mountainous districts, although it does not reach its full height. It is rarely found in forests. As has been previously stated, it is now grown in Government plantations from seed; but it also springs from roots which have been left in the ground.

Santal Wood.—Sanskrit, Chandana, Srihanda Varnacular: Bengali, Chandan; Hindi, Safed chandan. The wood and essential oil have been esteemed for the last 2000 years by the Hindus. The straight pieces of heart-wood are much valued for carving boxes, desks, and other useful and ornamental articles. Rich natives use the wood for burning their dead relatives, and all classes add at least one piece to the funeral pile. In powder the Brahmims mix it with the pigments they use for making their caste marks. As a medicine it is considered by them as bitter, cooling, and astringent. Reduced to powder it is taken in Cocoa-nut water, and an emulsion is used to anoint the body with after bathing. It is also burned to perfume temples and dwellings.

Sandal wood is imported into this country in logs from 3 to 4 feet long, and from 3 to 8 (rarely 14) inches in diameter. That the albumen is imported is very doubtful, as I have not found any mention of its presence here. The daramen is very heavy, somewhat hard to cut transversely, but easily cleft. In colour it is yellow, fawn-coloured, or reddish-brown. It has a very strong, persistent, agreeable odour. The taste is aromatic. "Three sorts are recognised in the commercial houses of China, namely, South Sea Island, Timor, and Malabar; the last fetches from three to four times as high a price as either of the others." *William Kirky, F.R.M.S., in the "Pharmaceutical Journal."*

The Herbaceous Border.

ADONIS PYRENAICA.

LOOKING upon the herbaceous border at Kew a few days since I observed a tuft of *Adonis vernalis* labelled "Adonis pyrenaica." This led me to make inquiries amongst amateurs who keep herbaceous collections, and I find that hardly one has *Adonis pyrenaica*, though several have *Adonis vernalis* under this name. One amateur who knows the plant told me that the Continental dealers who have *A. pyrenaica* in their catalogues nearly always send *A. vernalis* for it, and that he is certain that some take the precaution of scalding the root to death before sending it out! I know that Messrs. Ware had some of the true plant a few years ago, as I had one from them, but it died in a year or two, and I have always found it a difficult plant to keep. I have several times received it from the Pyrenees, where it is rare, being found only in one or two spots growing on sandy soil. It is entirely distinct in appearance from *A. vernalis*, having long-stalked stout broad leaves like those of a Carrot. The divisions of the leaves are much thicker than those of *Adonis vernalis*, which has stalks tufted to the base, and growing at the top like a fox's tail. *C. Wolley Dod, Edge Hall, Malpas, August 2.*

CALLIPSYPE CHE MIRABILIS.

This is probably the least ornamental, and, from a garden standpoint, the least important of the three known species; but any one who has seen it must admit that it is a singular-looking plant. A pair of broadish, oblong leaves are produced, but not till after the flowering period is over, so that the scape and flowers receive all due prominence. The former attains a height of 2 to 3 feet, bearing an umbellate inflorescence of nodding flowers that radiate equally all round. The perianth is comparatively small, and greenish-yellow, and is in this respect much inferior to *C. aurantiaca*, which also flowered at Kew last year about this time. The stamens, however, attain the same remarkable proportions, and protrude about 3 inches beyond the flower. They are white, and, together with the style, which is an inch longer, bend downwards and forwards in a body, with the apparent object of offering a convenient landing-stage for insects. A flowering specimen might lately be seen in the Begonia-house, at Kew. There is a figure

of the species in the *Refugium Botanicum*, tab. 168. The plant does not recommend itself for decorative purposes, but for those who make bulbs a speciality it is an object of much curiosity and interest. *J. F.*

LODOICEA SEYCHELLARUM (DOUBLE COCOA-NUT).

I DO not think the successful cultivation of the double Cocoa-nut is a matter of much difficulty if one or two important matters are attended to, the first being to grow it in a warm, moist atmosphere, where the thermometer is never allowed to fall below 70°. The most important of all is to carefully guard from injury the fleshy cotyledon, as shown by your figure (122, p. 557, vol. xxv.). It is from the extreme point of this remarkable growth that the true plumule and radicle are produced, and the thickened termination which gradually develops into the cup-like base. This must not be separated from the seed until the roots are sufficiently developed to support the plant, which certainly does not take place under two or three years, and then I would advise that it should only be separated by gradual decay, as the young plant, during the first three years, is supported almost entirely by the parent seed. The same thing takes place more or less in all large-seeded Palms. The treatment of the Liverpool plant was very simple, and as it led to success, I will briefly state it. The ultimate loss of the plant did not arise from any cultural difficulty experienced by those in whose care I left it, but on account of delay in erect-

CHOICE SHRUBS AT APPELEY TOWERS.

CERTAINLY in the Isle of Wight, and probably in the entire kingdom, there are few gardens more worthy of a visit for the sake of the choice and beautiful semi-exotic shrubs and plants found growing there so liberally in the open. That these things have often been written about is true, but hardly too often, as it may help some gardeners in reference to their cultivation in houses to learn that outdoors at Appley without protection at any time, they thrive grandly and are full of interest and beauty. Take such a plant, for instance, as the climbing *Trachelospermum jasminoides*, of which there is a beautiful specimen growing against an arched wall at the eastern end of the lawn. This is several feet broad and high, is in the most robust health and full of bloom, and yet in scores of conservatories it is found half starved and dirty. But on the other side of the wall there is the variegated form of this plant, doing well also. A partly covered way leads down into the stokehole of the adjoining conservatory, and upon the arched brickwork a bed has been made up of peaty turf, and upon it the plant thrives admirably, making strong growth. On the same side of the wall, and close by, is a greenhouse climber, *Aekbia quinata*, with its five-lobed leaves, that thrives admirably; then at the other side of the wall, and rather shaded by a large overhanging tree, are both the red and white *Lapagerias*, well established, and making very robust growths.

To very many the huge *Rhubarb*-like plant growing in a corner here is a stranger, because seldom seen. Its stems are some 4–5 feet in height, and covered with spines, whilst the leaves vary from 3 to 5 feet across. It is *Gunnera scabra*, so noble looking here, where it has ample space. Out in the open lawn, where beds are filled almost exclusively with trees and shrubs somewhat rare outdoors, Palms, such as *Chamerops Fortunei*, thrive grandly; indeed, one huge bed is full almost solely of these Palms and *Aralia Sieboldi*, making splendid growth—such large glossy leafage, indeed, that anything finer in the way of a foliage shrub is hardly conceivable. Here, too, in another bed, is that very odd and singularly fleshy shrub, *Colletia bictonensis*. This looks like a veritable monkey puzzle, for the solid fleshy spiny projections on each side of the branches, and called leaves for form's sake, find the next pair above transposed with the most irregular diversity, and thus they are alternated over the entire shrub. Then just by, in bloom, is a semi-climbing shrub, which much resembles a *Cotonaster* in growth; this is in full bloom, producing spikes of white flowers very freely, whilst the brownish berries of the previous year's production remains. This is *Leptospermum lanigerum*, and very rare it is. *Desfontanea spinosa*, represented by a fine bush, is covered with yellowish-red blooms of a semi-trumpet form, and that commonly assumed stone evergreen, *Choisya ternata*, is found in a bed a huge bush 9 feet through. A big mass of the old Lemon plants, *Aloysia citrodora*, is in full bloom, and rich in perfume. *Fuchsia*s, especially the old *Riccartoni* and *coccinea*, are everywhere in big bushes, and on one part of the terrace garden the former forms quite a noble hedge all aglow with its blood-red pendent blooms. How wondrously these *Fuchsia*s thrive all about Ryde only those can realise who have seen the huge trees and bushes about St. Helen's Green, for instance, where they constantly burst upon the eyes of the inland visitor with wondrous beauty. *Veronicas*, too, do finely, *Hendersoni*, *Andersoni*, and *Traversii*, seem never to suffer from frost or any weather. The Blue Gum has some noble vigorous specimens on the slope overlooking Southsea, that bear remarkable comparison to the ragged samples found on the mainland after the recent winter's frosts. These are some 20 to 25 feet high. Of *Spiræas* of the shrubby section, a great beauty is *ariefolia* with beautiful white flowers, but the rarest and noblest is *S. Hookeri*, which produces gigantic plumes, some 18 to 20 inches in length, and fairly rivaling those of the Pampas-grass in size and beauty. [Is *S. Lindleyana* the one meant?]

Camellias grow finely in a mass; *Azalea indica* in variety also does well. In one place there is a most beautiful Japanese *Acer polymorphum decussatum* growing as a single lawn shrub, feathered most elegantly to the grass all round, and is large and spreading. The Camphor tree, *Laurus camphora*, is a fine specimen, and close by is the Cinnamon tree

FIG. 36.—GERMINATION OF THE DOUBLE COCOA-NUT.

ing the new plant-houses when the entire collection were exposed to the frost of a severe winter, which destroyed this and many other valuable plants. On receipt of the nut from the Seychelles it was partially plunged in a bed of Cocoa-nut fibre and sand. At the end of about four months the cotyledon first made its appearance. As this gradually lengthened it showed a tendency to penetrate deep into the plunging material, but this was prevented by gradually raising the tip to the surface and covering it with 2 or three inches of light sandy soil. On this very important point I felt depended failure or success, and personally attended to it. I was aware that all previous attempts had failed by allowing this soft fleshy cotyledon to penetrate into an ungenial medium and atmosphere. When the cotyledon had extended its full length it became thickened at the extreme point, and ultimately produced the true plumule and radicle. For convenience of removal it was then potted in light sandy soil, a second pot being used to accommodate the seed (see fig. 36). At the end of three years the pot was full of strong healthy roots, the thickened base had gradually developed, two or three well developed Fern-shaped leaves had been produced, and the stout cotyledon remained firm and healthy as from the first. *J. Tyerman.*

DENDROBIUM BREVIFLORUM, Lindl.—This little Orchid, which Mr. Rolfe speaks of as "long lost," has been flowering, under the care of Mr. Chudley, my excellent gardener, every summer for the last twelve years, my plant's blossom having been identified by Prof. Reichenbach's own kindness, in August, 1875. It is now in copious bud. *P. H. Gosse, F.R.S., Sandhurst, Torquay.*

* Flinkiger and Hanbury, *Pharmacographia* (1874), 543.

also doing well. Amongst deciduous trees the American Lime, with its fine broad leaves, merits notice. This is certainly a rare tree in gardens, yet its foliage is specially noticeable, leaves measuring 6 inches by 7 inches, and of a dark green hue. Also very striking as a lawn tree is *Sophora japonica pendula*; it has a curious pendent or drooping form, somewhat resembling an awning to a throne.

These are but a few of the interesting things to be found at Appley Towers, gathered from time to time by the late Sir William Lutt, who was an enthusiastic gardener, and happily placed where Nature is all tolerant. The grounds are of the most delightful kind, and very well kept by Mr. Miles, the gardener, in spite of difficulties. The fine plant of the Japanese *Diospyros Kaki* in the orchard-house will not fruit very freely this year, as it cropped somewhat profusely last year; still it is doing well. As shown here, once a strong plant is obtained it will thrive readily in a cool house. *A. D.*

THE LITERATURE OF THE COLONIAL EXHIBITION.

REFERRING to the above subject (*Gardeners' Chronicle*, July 31, p. 146), I may perhaps be allowed to make the list more complete by the addition of a few notes on some publications not there enumerated. Referring to New South Wales it is stated that no list of products has been published, but the fact is that a very good *Official Catalogue of Exhibits from the Colony* has appeared. This catalogue consists of 473 pages, and comprises, besides various other matters, several excellent descriptive lists of woods, in some of which the native and scientific names are given, also the qualities of the timbers and the uses to which they are put, size and distribution of the trees. Some very interesting notes are given on the ethnological collection from New Guinea, such for instance as that on the "man catchers," which consist of a piece of bamboo, bent in a circular form, and enclosing a spike. "This terrible weapon," it is said, "is slipped over the victim's head and the spike runs through his throat." In a collection of grasses and fodder plants from the Lachlan River district the interesting *Nardoo* plant occurs, described here as *Marsilia bisuta* of R. Br., but referred to in the *Flora Australiensis* as *Marsilia Drummondii* of A. Br. This plant it is stated "is found only on the margins of swamps, or where water collects in shallow ponds after rain. The seeds which it bears profusely germinate in the water, and, rising to the surface, cover it with a green coat, resembling a scum. As the water subsides these small plants take root in the soft mud, and should no more rain occur they . . . cover the ground with a dense coating of vegetation, seeding profusely; and should the weather continue dry the plant withers off, leaving the ground covered with seed. Should, however, rain come before the plant has withered, and the ground be again covered with water, this growth is arrested, and the plant assumes another form, the previous leaves decaying, and others somewhat different take their place. These rise on long slender stems (according to the depth of water) to the surface, where they float on the top; these changes go on according to the weather. It never bears seed whilst growing in the water, no matter how long that period may last. Stock of all kinds are extremely fond of this plant, which affords a most nutritious fodder. In former years the seeds were largely used by the natives as an article of food. The unfortunate explorers, Burke and Wills, existed for some time on them."

Victoria, besides its well illustrated *Handbook*, issues a *Catalogue of Exhibits* containing a detailed list of the fine set of Victorian timbers, an enumeration of Mr. Bisotto's exhibits of Eucalyptus resins and oils, and a valuable descriptive list of native fibre-producing plants, of which a corresponding collection of dried plants alphabetically arranged is shown.

The West Indian courts are far from being the "least well represented" in the subject of literary matter. An excellent *Catalogue and Handbook to the West Indies and British Honduras* has recently appeared. It is illustrated with three coloured views of the West Indian court, and an engraving of the court devoted to each colony, a brief history and description of which, with notes on their products, is also given. Besides this book, which is sold at the stalls, there is also a pamphlet of some sixty pages,

which gives much information on the situation, population, history, constitution, health, trade, productions, religions, plantations, natural history, &c., of Jamaica. This book is freely distributed, being laid out by the court in large numbers for visitors to take. In the Cape of Good Hope, besides the catalogue already alluded to, mention ought to be made of the very excellent official handbook of the history, productions, and resources of the Cape, one of the cheapest and best books of the whole Exhibition Series.

The uniformity in size of the Handbooks and Catalogues issuing from the present Exhibition is a great improvement over its predecessors; it enables them to be bound up in uniform volumes, and thus kept together as a record of the condition and prospects of the colonies in the year 1886. *John K. Jackson, Creator, Museums, Royal Gardens, Kew.* [In the note in question allusion was made to all the catalogues our reporter was able to purchase at the book-stalls. Some of the other books mentioned by our correspondent had been previously alluded to, e.g., the excellent Cape Handbook. The West Indian, Victorian, and Indian Handbooks are unknown to us. Ed.]

HOME CORRESPONDENCE.

A New Pea.—Prodigy, sent out by Messrs. Veitch this season. Surely this must have been the Pea hinted at by the raiser, Mr. Culverwell, of Thorpe Perrow, in the discussion on Telegraph and Telephone Peas, as the one that was to come to eclipse Telephone; if so, I am on an awfully safe track. Grown side by side the superiority of Prodigy is very marked, and it is by far the best early Marrow I have yet grown. I say early, for, sown with William I, it is ready about the same time—only a few days between them. I enclose a sample of Prodigy for you, Mr. Editor, to admire and taste, if you will. I fancy your keen eye will at once detect we have in this Prodigy, as we had and still have in Telegraph, light and dark green pods and Peas. I hope they will not be unfortunate enough to be named two varieties, for they are grand as one. *T. Keddell, Darley Abbey.* [The sample sent to us was too old to be a good cooking test. It bears a well filled pod of large Marrow Peas, and would make a market Pea where quantity and earliness are the chief considerations. Ed.]

Boiler Contest, Liverpool.—At p. 118, Mr. Wood complains that his two competitors in the 200 feet contest were "not so equalised, because they did not fix their piping according to Rule 5." That the piping should not rise more than 6 inches in 100 feet, but as the contest was between the boilers on their own merits, as much as on the results as shown by the thermometer, a good boiler was not made a bad boiler because of the level the piping was laid at, and in any case Mr. Wood scored a point owing to his being right with his level, and also through being the best in result as to temperature. As regards the reading of Rule 5, Mr. Wood is in the right it would exclude all boilers which, having waterways, should be able to connect them with the upper part of the boiler, as Mr. Wood considers the flow and return from the waterway-bars separate flows and returns, whereas the boiler would not be complete without them. Though it might be interesting to your general readers to hear all the merits and demerits of each boiler, it might not be so interesting to the makers, so I am only remarking that Mr. Wood gets full justice, he should remember that there are other points. *J. B., Jr.*

Rock Gardening.—In my humble opinion there is no gardening like hardy plant gardening, and no hardy plant gardening like that on rockwork and mounds. I have just returned home from a visit to Edge Hall in Cheshire, where rockwork gardening is admirably carried out. Much had been done since my last visit; the rockwork with its varieties of stone is wonderfully successful, and shows what energy, perseverance, and study, assisted by an excellent library, will do in a climate colder and damper than our home counties. Many of the plants, some of them difficult ones, grow in such vigour that it shows that the climate suits them; but sheltering rock and judicious lightening of soil makes others grow which prefer warmer and drier situations. Campanulas have always been favourites of Mr. Wolley Dod, some of the rarer ones were simply masses of bloom, a favourite plant of my old friend Mr. Atkins, of Painswick, Onondaga township, had grown more luxuriously than I ever before saw it. *Arnebia dichotis* showed itself thoroughly at home, as did many of the rare Saxifragas. I will not attempt to enumerate the different plants which are in great numbers, and many of them rare. I was much interested to find that Mr. Dod, by his broken granite, had arrived at results which we have been attaining by different means but on the same principle. To his garden

beds *Lilium pardalinum* in all its varieties, and *L. testaceum* were very fine and in great vigour; and in a rough, cold Lily-house *L. Parryi*, *L. Humboldtii*, *L. Washingtonianum*, and *L. Dalmaticum* were as fine as I have ever seen there, as well as many others. People often speak of gardening as a pleasant amusement; it is of course a pleasant occupation, but carried out as it is at Edge Hall, it is as much a study and a science as any of the more recognised sciences. In conclusion, I would advise any one with plants, especially alpine, which they cannot master, to send some to the Rev. C. Wolley Dod, Edge Hall, Malpas, Cheshire, and I shall be surprised if he does not discover how to make them grow. *George F. Wilson.*

Godetias.—Godetias, where properly and well cultivated, have made good displays this season. After having been properly planted in good soil early in the season and supplied with a fair quantity of moisture they delight in dry hot sunny weather. Too frequently the same mistake is made in connection with their culture as with most other annuals. It consists of sowing too thickly and permitting too many plants to grow together, as well as neglect in the matter of transplanting. The Godetias succeed to no other annual for the ease with which they can be transplanted. Transplanted into rich soil during showery weather each plant is capable of making plants 18 inches high and 9 inches through, clothed throughout with an abundant mass of its large showy blooms. Very large beds so grown are before me as I write, and are exceedingly gay. Probably few annuals repay selection in the matter of seedings as do these. Normally they are prone to run in the matter of colour, hence too much attention cannot be given to the simple matter of seed sowing. Godetias do well in tubs and boxes, transplanted therein somewhat singly as suggested. From their known partiality to warm sunshine they would succeed well in sunny outside window boxes. Seeds sown in a warm garden border in the early spring would soon form plants fit for transplanting therein, with the assurance that a few degrees of frost would not affect them adversely. *William Early.*

The Origin of the Garden Pentstemon.—In reference to Mr. Douglas's reply to my remarks on this subject I must point out that I took his notes as they stood, and could not be supposed to be acquainted with all his previous papers. Believing his speculations to be misleading I ventured to point out what appeared to me a serious omission. In the absence of any evidence to the contrary I am still of opinion that our bedding Pentstemons are the direct descendants of the *P. Hartwegii* of Dentham, and I also repeat, what every botanist knows, that this plant was incorrectly figured and described both in the *Botanical Register* and the *Botanical Magazine* as *P. gentianoides*. It is true that the latter was described and figured by Humboldt long previously, but it had not been actually introduced into cultivation until subsequent to the publication of the figures above referred to, it was not to be known. I grew the plant for a season or two about the years 1842-3, having received it under the name of *P. gentianoides* vens (it was written vera by the way). It proved to be a robust plant, of bushy but somewhat stiff habit, and by the time it bloomed, which was not till the second season after planting out, had reached the height of 3 or 4 feet. Its short, horizontally disposed flowers, of a purplish-violet colour, were pretty freely produced. If "J. D." can refer to Professor Asa Gray's Synopsis of the genus, in the *Proceedings of the American Academy of Arts and Science*, October 14, 1862, he will find both of the species under discussion described and referred to their respective figures. He will also find, in *Faxton's Flower Garden*, a correction of the error committed in the *Botanical Register*, but I cannot quote chapter and verse, not having the volumes at hand. If he is still incredulous I can only refer him to the nearest botanist of his acquaintance. *Silvanus.*

Time of Seed Sowing.—Your correspondent, "Tium" (p. 135) has opened a question in which common-sense and experience must alone be the teachers, especially as regards the rules for sowing laid down in seedsmen's catalogues, as these can only apply approximately. Almost everything in sowing seeds depends upon soil and situation and the state of the weather, and upon whether it be the market gardener or a gentleman's gardener. The aim of the market gardener will be to endeavour to get his crops out, and take them to market when he thinks the most profit can be made; but the gentleman's gardener has to be guided by the wants and wishes of his employer, and by the possibilities of the place; everything has to bow to these, therefore the latter will have to continue sowing, and planting, and learning from his failures, and doing his best, the best he can under all circumstances. It would never be advisable for a private gardener to sow his first crop of Peas in April; he must have three or four crops of these under weigh before then, and his first crop should be in bloom by that time, if he

means to pick useable pods in May, as he ought to be able to do in fine seasons. I know it is often said that we do not gain anything by early sowing or planting, but that is a statement few gardeners believe, and, moreover, he has to be content with small quantities of nearly everything he grows in the early part of the year, and to this end he has to cut and contrive and utilise all sorts of structures and shelters. The warmest borders and sheltered corners have to be utilised, and he has to take advantage of everything that will assist him, or his next neighbour may chance to be in advance of him. The great thing is to get a little of everything early. The time to get in the main crops is the months of March and April, these main crops being sown on quarters properly prepared for their reception; and as the time comes round and then during April, May, and June, these crops have to be watched, in order to make good any failures as soon as perceived. The good gardener does not wake up by his end starts, but has everything at his fingers' ends, and knows when and where and how to do his work. In looking back upon my gardening life I remember doing nearly everything each year almost on the same day of the month, and as the seasons have come round I have attended to each operation as a matter of course, and have not neglected to watch for improvement in method in this go-ahead age. Everybody thinks he can garden, and there are many among all classes who have some amount of success, but this is very different to being a gardener by training, and book knowledge does not help much unless combined with experience. C. D.

Lapagerias.—A Lapageria-house is a rarity and a luxury too. I am only able to place on record one private garden where a greenhouse is styled a "Lapageria-house." [There is one at Saltaire, Ed.] Since the Rose is denominated "the queen of the garden," the Lapageria ought to rank as "the monarch of the greenhouse," because it is perhaps the most beautiful of climbing plants. The house under notice is a charming little place, some 9 feet by 15 feet, built and laid out where, at the rear of the stoves and Orchid-houses in the famous gardens of John Marshall, Esq., Mount Nebo, Taunton. It is a lean-to building with upright front sashes and contains three or four thriving plants of the white Lapageria, whose luxuriant growths are trained methodically to the roof, and the result is that just now their pendulous flowers of pure white cover all the plant, in fact hang down in clusters, one of which is herewith sent you that you may form a better idea of the vigour of the plants. The gardener, Mr. Lucas, recommends a west aspect for a Lapageria-house, strong plants to commence with, much patience on the part of the cultivator, and the utter abolition of all slugs. His plants are planted out in prepared beds above the floor line, and the roots are enclosed in limited spaces by slates. The compost used consists mostly of fibrous peat and plenty of sharp sand with an addition of some charcoal. Frequent watering and copious supplies of water are indulged in whilst the plants are in active growth, and a cool temperature is maintained. *W. Napper, Alington Cross.* [A fine terminal truss accompanied this communication. Ed.]

Annuals as Decorative Flowers.—A few days since, having to wait for a train at Southampton, I took the opportunity to look in at a small enclosure of some half dozen acres of land close to the railway station, and in which a few years since was converted from a rather rough piece of pasture rejecting then in the plebeian appellation of Porter's Mead, to a pleasure garden, now more ambitiously designated Queen's Park. Neither trees nor shrubs had yet made any appreciable growth, and it is a matter for opinion whether some of the expanses of grass so pleasant as recreation grounds for myriads of little ones were not a bit over-done with big but otherwise rather bald beds of shrubs. However the town gardener had literally taken to the roots of the hedges, and for the greater part of the summer these beds were made singularly gay by means of single and double Poppies of the most varied and beautiful kinds, so that beds and borders were aglow with colour of the most charming description. Simply sown broadcast and raked in, the labour involved has been of the smallest, whilst the results have been of the happiest. Added to Poppies, Clarkia elegans, dwarf Rockets, Larkspurs, Candytufts, Eschscholzia cresea, Convolvulus minor, Gilia tricolor, and other hardy annuals were employed as lies and edgings with admirable effect, creating beauty that, if somewhat fugitive, certainly is beauty of the most pleasing kind whilst it lasts. In beds were such good old bedders as the yellow Gazania splendens, Pálox Drummondii and white, and striking capital masses; striped and self Petunias, Lobelias, &c., and were very effective. So much gaiety on such simple elements is a thing to be noted, and all this in an open space close to the sea-side, exposed to the sweep of southerly winds, and on its upper sides encompassed by houses. But for the happy thought of the gardener in sowing annuals so

liberally the park might, beyond its verdure, have been a sort of wilderness. In lying out places of this kind there is perhaps too much anxiety to offer a design which looks pretty upon paper; hence more beds and borders than needful are formed, and circular or serpentine paths, which lead nowhere, are designed. Nothing can excel the permanent beauty found in broad expanses of verdure and good trees, but flowers will help to gloss over many imperfections. A. D.

Lilium candidum : Narrow-petalled Variety. —Seldom has *Lilium candidum* bloomed so finely as during the present season. On all sides around, especially in cottage gardens, immense spikes of finely developed blooms have been observed. I have here a narrow-petalled variety of this Lily, which certainly deserves some further notice than has yet been given, more especially now that Lilies have come into more favour generally. The original *L. candidum* possesses, as is well known, wide petals, that offer an obstacle to its use generally in bouquets and other arrangements of cut flowers, but intermixed with Iris or other similar leaves, this narrow-petalled variety is second to none. Spikes of this Lily, and common white Jasmine flowers and shoots arranged in a vase, are both beautiful and fragrant. Botanical works register four varieties of these Levant Lilies, but this narrow-petalled variety finds no place amongst them, unless indeed *Lilium spicatum* refers to it, which I fail to believe, judging their blooms structurally, yet both seem the variety is distinct enough, though it may be a garden sport, as to deserve recognition. W. E.

Trees at Devonport, Chiswick.—This place, the residence of E. H. Watts, Esq., will ever possess interest for every true horticulturist, for it was once a part of the Royal Horticultural Society's garden—the arboretum, in fact. A very interesting reminiscence of the famous Chiswick show existed in this place up to last year, when it was sold, in the shape of an iron tent, zinc roofed, 120 feet by 120 feet, which was the magnificent exhibit of Mr. Lawrence's stove and greenhouse plants, the genial and successful Barnes Brothers (William and James) of Camberwell and Bickton; Glendinning, Chiswick; Lee, Hammersmith; Rollison, Tooting; Lane, Birkhamstead, and a crowd of other horticultural notabilities who shone so brilliantly on those days at Chiswick. Referring again to the arboretum, it may not be out of place to quote here some remarks made by the late Dr. Lindley in an article on the Society and its prospects in the *Gardener's Chronicle*, in the year 1852, about the time when the Society was migrating—had, indeed, migrated—to South Kensington:—"It would also be tortuous if we should persuade those who are merely in search of the beautiful to examine some points in this garden in merely an artist's spirit. The trees in the arboretum are now forty years old, in many cases having grown unchecked and unpruned, and the diversity of natural forms to study to advantage, and form some charming studies for the landscape gardener. Then there are deserted byways fringed with Spanish Chestnuts and other trees, whose arms meet overhead, and cover a mass of tangled foliage on either side, producing the effect of narrow country lanes, with the exception that they are as free from dust as intertropical. We strongly recommend this scene, especially when in half light, to young artists in search of studies from Nature. And what a host of fine things in the tree way may be seen there now—practically the arboretum as it was in the old times. What a change from the busy high road of Chiswick (on which the estate abuts) into this sylvan retreat. One might imagine oneself to be 200 miles off in the country. By the house is a magnificent specimen of Spanish Chestnut, grandly proportioned, 45 to 50 feet in height. Near this is a fine group of *Acacia* in variety, also myriophyllum, an indeed splendid example of tree growth, being especially notable—the spread of foliage is about 120 feet through. It also possesses a degree of interest for lovers of old and venerable things, in that the label recording the name is one that was written when the Horticultural Society was "in possession." It is now scarcely legible; but there it is, forming a link with the past in the history of the Society. Next to demand attention is a noble specimen of *Cedrus* at least a mile or so feet in height, probably one of the finest plants in the country of this grand tree; it is coming freely this year. The old Oaks, as might be expected, figure prominently, particularly one being an evergreen variety, *Quercus Ilex integrifolia*, with a spread of foliage some 50 feet through. A Copper Beech, 60 to 70 feet in height, very imposing from a landscape and picturesque point of view. Much of the English Elms make a striking feature. There are also many other things of the most remarkable things to be seen in the tree way. We have not, for instance, referred to the fine Planes, Walnut, Ash, Golden Sycamores, &c.; but sufficient has been said to show that it is a place of no ordinary attraction to lovers of arboriculture, and was enriched in former

years with many fine species and varieties of ornamental and useful trees as are possessed by no other suburban garden. B.

Zinnias.—There are just now a few beds of these annuals in full beauty at Chiswick, brilliant with scarlet-crimson, rose-coloured, buff, or white flower-heads. The Zinnias have often an advantage over most other summer annuals in that their beauty is retained for several weeks. A. B.

Reports of Societies.

WILTS HORTICULTURAL: July 29.

This, the second show (resuscitated from the old society), was held, by kind permission of the Bishop, in the Palace grounds, Salisbury, and a more suitable place for the holding of such an exhibition it would be difficult to find, and still more so to secure.

The committee and the indefatigable and courteous Hon. Secretary (Mr. W. H. Williams) are to be congratulated upon the success of their efforts to make the show a thoroughly interesting and representative one, a circumstance which, as Mr. T. Challis remarked at the luncheon, it is to be hoped will "encourage the committee to continue their efforts, so that Salisbury would in the future be as it had been in the past, the leading town in the county for horticulture." Most of the classes were well contested and the exhibits generally of excellent quality. The magnificent plants staged by Messrs. Lock, Cypher, Rann, and Mauld, were greatly admired, especially the Crotons, which were alike remarkable for their great size and the stamp of great cultural skill which they exhibit. Fruit though shown fairly well, was not so abundant as it was last year, when the show was held three weeks later.

PLANTS (OPEN CLASSES).

For twelve stove and greenhouse flowering plants there were only two entries, Mr. James Cypher, Cheltenham, and Mr. Rann, Handcross Park, Crawley, who took the prizes in that order with well-flowered plants. Mr. Cypher's collection contained, among others, *Phaeoecoma prolifera* Barnesii, 5 feet through, and grandly flowered; *Isora amabilis*, very bright in colour, and covered with flower; I. Pilgrimi, having large bold bracts; *Stephanotis floribunda*, Erica Irbayana, E. retrorsa major, E. Thomsoni, and *Allamanda Hendersoni*. Mr. Rann's best plants were Erica Williamsi, large, and profusely flowered; *Statice Gilberti*, and *Allamanda Walsleyana*.

In the class for the same number of variegated and fine-foliated stove and greenhouse plants four excellent collections were staged, the plants in the 1st and equal 2d being very close in point of merit, thereby necessitating considerable time being spent by the Judges in determining the relative positions of three such uniformly good lots of plants. 1st, Mr. Lock, gr. to W. B. Cleave, Esq., Newcombe House, Crediton, Devon; equal 2d, Messrs. Cypher and Rann.

Mr. Lock's best plants—and it is difficult to particularise where all were so good—were *Gleichenia spelunca*, 12 feet over, beautifully trained and in fine condition; *Crotons*, Warreni, Williamsi, Durcaili Johannis, and Chelsoni (all highly coloured), *Cocos Weddelliana* (a grand plant of the kind), *Cycas revoluta*, *Dasylirotum acrotichum*, *Latania horborea*, and *Kentia Balmoreana*.

Mr. Cypher's best plants were *Thrinax elegans*, very fine *Cycas circinalis*, C. revoluta, *Crotons majesticus* and Prince of Wales, *Kentia Fosteriana*, *Crotonylne indivisa*, having dark green leaves a inches wide; *Dasylirotum acrotichum*; Mr. Rann's best being *Croton Warreni*, 9 feet over, and grandly coloured; his other plants, similar to those two in the other collections, being equally good. Mr. Mauld, Pewsey, Wilts, was awarded an extra prize in this class for smaller but fresh, clean, well-grown plants.

GENTLEMEN'S GARDENERS' CLASSES (AMATEURS).

Mr. Lock was 1st for six stove and greenhouse flowering plants, distinct, showing fresh, well-flowered plants of *Erica coccinea*, E. Barnesii, E. Thompsoni, E. ampullacea, *Dipladema amabilis*, and *Anthurium Scherzerianum*; the 2d going to Mr. Mauld for a nice even lot of plants.

For a like number of variegated and fine-foliated stove and greenhouse plants there was the same number of entries. 1st, Mr. Lock, whose best plants were *Alcaecia macrocarpa*, variegatum, *Turpinia elegans*, and *Kentia Fosteriana*; Mr. F. Smith, gr. to the Lord Bishop of Salisbury, being a very good 2d, showing in his collection good plants of *Pandanus Veitchii* and *Croton Weismanni*. In the class for nice exotic Ferns and Selaginellas the same exhibitors were 1st and 2d, both showing well.

Mr. H. W. Ward, gr. to the Earl of Radnor, Long-

ford Castle, Salisbury, was 1st for six pots of Lilliums, showing well flowered plants of *L. speciosum* Kratzeri.

Dr. F. W. Coates, Salisbury, was a capital 1st in the class for six tuberous-rooted Begonias, showing neat, fresh, well-flowered plants; the 2d prize going to Mr. Thornton, gr. to Mr. Greenwood, Ilminster Cliff, Salisbury.

Mr. Lock had the best six plants of Gloxinias, showing good, well-flowered plants; Mr. T. Wilkens, gr. to Lady Theodore Guest, Inwood House, near Shaftesbury, the 2d best; and Dr. F. W. Coates the 3d best, all three showing well.

AMATEURS.

These classes were fairly well contested, and the exhibits generally of merit. Mr. John Curry, gr. to Colonel Pepper, Elm Grove, Salisbury, showed the best six stove and greenhouse plants, distinct; and Mr. Lovibond, St. Anne's Street, Salisbury, the 2d best, both showing well.

There were three collections of six Ferns staged; 1st, Mr. J. Curry, with small but fresh plants of *Gyanogramma chrysophylla*, *Adiantum gracillimum*, a good plant, &c.; 2d, Mr. Gregory, The Mill, Salisbury; the 3d going to Mr. Lovibond, all three showing very creditably grown plants.

Four lots of six Coleus, distinct, were staged. 1st, Mr. T. S. Fulcher; 2d, Mr. J. Rockett, gr. to G. Smith, Esq.; 3d, Mr. Lovibond—all of Salisbury, for neatly-trained, well-coloured plants.

Dr. Coates was 1st for three pots of Lilliums, showing good plants of *L. Harrisii*, the flowers being large and fresh; 2d, Mr. E. Gregory.

Messrs. John Curry, T. S. Fulcher, and Lovibond took the prizes for six zonal Pelargoniums, distinct, in the order in which their names appear, in a well contested class.

The prizes for four distinct varieties of variegated-foliaged Pelargoniums went respectively to Messrs. E. L. Brown, Portland Place, Salisbury, and T. S. Fulcher, both showing neat little plants. Dr. Coates was again 1st for six Begonias, showing, as in the class open to gentlemen's gardeners and amateurs, well-flowered plants; Mr. Curry being placed 2d.

FRUIT (OPEN).

Three collections of eight kinds were staged, the contest between Mr. W. Iggulden, gr. to the Earl of Cork, Marston House, Frome, and Mr. H. W. Ward, being a very close one, but the points which the Black Hamburg and Muscat of Alexandria Grapes and Apricots in the latter's collection gained over those in his opponent's he lost in Peaches and Nectarines, the latter being Mr. Ward's weakest dish. Mr. Iggulden staged Black Hamburg and Foster's Seedling Grapes, a neat Queen Pine, good Gros Mignonne Peaches and Victoria Nectarines, Brown Turkey Figs, a good fruit of Blenheim Orange Melon, and Moor Park Apricots; 3d, Mr. J. Evans, gr. to Lady Ashburton, Melchet Court, Romsey.

Mr. Ward had the best Pine-apple, and Mr. J. Evans the 2d best, both showing Queens.

Grapes.—Seven three-bunch stands of Muscat of Alexandria were observed, the majority of which were quite unripe. Mr. Pratt, gr. to the Marquis of Bath, Longleat, Warminster, was 1st, with large and fairly well-ripened bunches for their size and season; Mr. James Budd, gr. to F. G. Dalgety, Esq., Lockerby Hall, Ramsey, being a good 2d, showing smaller but slightly better-coloured bunches; 3d, Mr. Northeast, gr. to Mrs. Torrence, Norton House, Heytesbury, Wilt.

In the corresponding class for Black Hamburgs, Mr. Pratt was a good 1st, showing large well-coloured bunches carrying a fine bloom, which like the Muscats, were placed 1st a couple of days later at Southampton, Mr. Charles Warde, gr. to Sir J. P. Bathurst, Bart., Clarendon Park, Salisbury, was a creditable 2d; and Mr. Iggulden 3d, both showing smaller and well finished bunches.

In the class for like a number of bunches of any other white Grape than Muscat of Alexandria, and any other Black than Hamburg, Mr. Ward was 1st, with well ripened bunches of Buckland Sweetwater; Mr. Warden following closely with the same variety, Mr. Budd being 3d, with good but rather green bunches of Mrs. Pearson; several lots of unripe examples of Foster's Seedling were shown in this class.

The last-named exhibitor was 1st, with Madresfield Court Black Muscat; Mr. Warden 2d, with the same variety; and Mr. Ward 3d, with Black Prince.

MELONS.

Several lots of these were shown, Mr. Pratt securing 1st place with a fine, large, and highly-flavoured fruit of Longleat Perfection, and Mr. Iggulden 2d with a smaller fruit of the same variety.

Out of several dishes of Peaches, Mr. J. Evans was 1st with highly-coloured fruit of Royal George.

In the class for six Nectarines, Mr. Budd was an excellent 1st with Elruge.

FRUIT (AMATEURS).

For a collection of six kinds of fruits.—1st, Mr. Gregory; 2d, Mr. J. Curry. Messrs. Lovibond and Gregory were placed 1st and 2d respectively for two bunches of Black Grapes, both showing creditable bunches.—Mr. Gregory and Mr. Curry taking 1st and 2d in that order, for two bunches of white Grapes.

Mr. E. L. Brown was the only exhibitor of Peaches in this class, showing the best fruit in the show.

Mr. Gregory was the only exhibitor of Melons in this class.

VEGETABLES (OPEN).

The only class provided for these in the schedule was that for a collection of twelve kinds, and a right good competition was brought out. The awards in the 1st and 2d prize collections were not accepted by many gardeners who are competent to form an opinion. 1st, Mr. Wilkens; 2d, Mr. Haines, gr. to the Earl of Radnor, Coleshill House, Highworth, Berks; and Mr. A. Miller, gr. to W. H. Long, Esq., M.P., Rood Ashton Park, Trowbridge, was 3d. Mr. Pratt, who made his first appearance as an exhibitor of vegetables, also showed well in this class.

Amateurs and cottagers also showed vegetables well in their respective classes, there being notable improvement in the different kinds of garden produce since last year.

CUT FLOWER CLASSES (GARDENERS AND AMATEURS).

Roses.—These were shown very well for the time of year. T. W. Girdleston, Esq., Sunningdale, Bagshot, was 1st for thirty-six single trusses, distinct, with a good, fresh even lot of blooms. Mr. Campbell was 1st for twenty-four trebles, distinct varieties.

In the corresponding class for a like number of single trusses, distinct varieties (not open to exhibitors in the two preceding classes), Mr. J. Marlow, gr. to Mrs. Pigott, Cholden House, Salisbury, was 1st, showing a good lot of blooms. Five stands were put up.

Only two stands of twelve spikes of Gladioli (not less than six varieties) were put up by Mr. J. Evans, and Mr. R. West, gr. to J. R. Wigram, Esq., Northlands, Salisbury, who took 1st and 2d prizes in that order.

AMATEURS (RESIDING WITHIN TWELVE MILES OF SALISBURY).

Mr. H. G. Gibbs was 1st for eighteen Roses, distinct, showing a very good lot of blooms, and Mr. J. Marlow, Fisherton, Salisbury, was 1st for twelve Roses.

LADIES' CLASSES.

These brought forth a spirited competition, and really good arrangements of choice flowers intermixed and fringed with grasses, sprays of Fern, and leaves.

NOT FOR COMPETITION.

The Messrs. Keynes, Williams & Co. of the Castle Street Nurseries, Salisbury, had a tastefully arranged group of miscellaneous foliage and flowering plants, Roses, and other cut flowers, which were bedecked over by the sprays of a small fountain at play in their midst.

The several stands of Roses, having a variety of plants as a background, arranged by Messrs. Brittan & Son, The Waterloo Nursery, Salisbury, on one of the stage ranges in the large tent containing, in the centre, the magnificent foliage plants of Messrs. Lock, Cypher, and Rann, and the Roses and other cut flowers on the side stages were also a notable feature in the show.

SOUTHAMPTON ROYAL HORTICULTURAL July 31.

This exhibition must be again recorded as a success, and as a magnificent show; particularly does this latter apply to the plants, which were arranged in a tent 200 feet long and 75 feet wide. The groups were numerous, and, as they always are at these exhibitions, most tastefully arranged.

Table decorations and bouquets were extensive and of high merit. This remark applies to cut flowers, particularly Roses, for so late in the season; Dahlias and herbaceous flowers.

Fruit was not quite so largely represented, owing to the unfavourable season, but there were some capital specimens of Black Grapes, Melons, and other indoor kinds.

Vegetables especially were a strong feature, whilst the quality was good. Cottage productions were excellent in the vegetable classes.

A fine exhibit of cut blooms of tuberous Begonias, both double and single, came from Messrs. J. Laing & Co., Forest Hill, London, S.E., as were also the seedling double Hollyhocks from the same firm.

Messrs. Keynes, Williams & Co., Salisbury, staged a capital lot of Gladioli, Verbenas, pompon and showy Dahlias and Roses, not for competition, which were much admired.

The new yellow Carnation, Pride of Penhurst, which was certificated at the last meeting at South Kensington, was well represented by a bouquet arranged with its grass, and showed its excellence to the best advantage.

At the entrance to the tent specially set apart for their Royal Highnesses the Prince and Princess Henry of Battenberg were two magnificent Fuchsias, each 9 feet high and 4 feet through, grown by Mr. E. Wills, gr. to Mrs. Pearce, The Firs, Bassett, Southampton. Mr. Cypher, Cheltenham, presented a bouquet of Orchids to Her Royal Highness.

GROUPS.

The class for twelve stove and greenhouse plants, six in bloom and six foliage, distinct (open), made a splendid array. Mr. G. Lock, gr. to B. W. Cleave, Esq., Newcome House, Crediton, was placed 1st; his foliage plants were of good quality, but the flowering ones were rather weak; *Lantana borbonica*, *Euphorbia villosa*; ampelias, Croton Warren, 6 feet in diameter, with beautifully coloured leaves; also C. Williamsii, equally good; *Ixora coccinea* was represented by a fine specimen; *Erica Thompsonii* was likewise a fine plant. 2d, Mr. J. Cypher, nurseryman, Cheltenham, with a fine lot of plants, superior in flowering but weaker in foliage plants; particularly good were *Dipladenia amabilis*, *Stephanotis floribunda*, and *Phenacomena profitera* Barnesii; *Cycas cernialis* was excellent, whilst *Croton majesticus* was weak. 3d prize was awarded to Mr. C. Rann, gr. to J. Warren, Esq., Crawley, Sussex.

For the same number of plants as in the above class, but confined to nurserymen, Mr. J. F. Mauld, Pewsey, Wilts, was awarded 1st, *Erica Maraoackiana*, rich and fresh in colour, being one of his best plants; 2d, Mr. James, Castle Nurseries, Norwood, who had an extra fine specimen of *Lantana borbonica*; Messrs. J. C. & H. Ransome, Shirley, were 3d.

With the same number of plants as in the two former classes (amateurs) a very fine show was made 1st was awarded to Mr. E. Wills, gr. to Mrs. Pearce, The Firs, Bassett, Southampton, his best plants being *Erica profusa*, 5 feet in diameter, profusely bloomed, and of a rich colour; a full-flowered specimen of *Stephanotis floribunda*, *Cycas revoluta*, and *Verschaffeltii splendens*, in capital condition. Mr. J. Ams, gr. to the Hon. Mrs. C. Yorke, Netley Cliff, was 2d, with a fine plant of *Allamanda Hendersonii*, *Erica tricolor* vera, *Trachelospermum jasminoides*, freely flowered; and a healthy specimen of *Cycas revoluta*; but his other foliage plants were somewhat weak. Mr. N. Blandford, gr. to Mrs. Haslefoot, Moorfields, Bitterne, was 3d.

Still another class was provided for specimen plants, but in this case nine was the number required, various, not less than three to be in bloom. Mr. E. Molyneux, gr. to W. H. Myers, Esq., Swanmore Park, Bishop's Waltham, was 1st, with *Trachelium ceruleum*, a plant seldom well shown; *Allamanda Hendersonii*, and a well-coloured *Croton variegatus*, as the chief plants; Mr. J. Reynolds, gr. to Colonel the Hon. H. Crichton, Netley Castle, was 2d—*Croton Norii* and *Cycas revoluta* being the best plants. Mr. W. Peel, gr. to Miss Todd, Sidford Lodge, Shirley, was 3d.

For the best group of miscellaneous plants arranged for effect in half-circle or in feet, the tallest plant not to exceed 7 feet in height, there were numerous entries, the groups filling one side of the large tent. The 1st prize was awarded to Mr. H. James, with a choice collection of plants most effectively arranged. At the back were *Caladium* and *Drazenas*, and some good plants of *Cocos Weddelliana*. The middle and front were filled with light plants, such as small *Orchids*, &c.; a front row of *Isolepis gracilis* completed this handsome group. 2d, Messrs. J. C. & E. L. Ransome, with an equally fine group, including *Begonias*, *Gloxinias*, *Crotos*, *Palms*, *Panicum variegatum*, and *Maidenhair Ferns*; 3d, Mr. J. Reynolds; 4th, Mr. E. Wills; 5th, Mr. J. Ams.

ORCHIDS.

The collection of Orchids staged by Mr. T. Osborne, gr. to H. J. Buchan, Esq., Southampton, was choice in quality, although the individual plants were not large; *Dendrobium Dazrei*, *Cattleya crispa*, *C. superba*, C. Gaskelliana, *Odontoglossum Alexandræ*, *Epidendrum vitellinum majus* being some of the finest.

The best single specimen Orchid, not a made-up plant, was shown by Mr. Budd, gr. to F. J. Dalgety, Esq., Lockerby Hall, Romsey, it was *Calanthe veratrifolia*; Messrs. Osborne & Blandford were 2d.

MISCELLANEOUS.

Mr. Cypher showed the best Health, *Erica retorta* major; 2d, Mr. James; 3d, Mr. G. Lock. Mr. Ams staged a grand specimen of *Allamanda Hendersonii*, 6 feet in diameter with flowers of an extra large size, as the best flowering plant; Mr. Wills was 2d, with *Stephanotis floribunda*.

For double flowered Begonias, Fuchsias, hardy Ferns, and *Celosia pyramidalis*, Mr. Wills was 1st.

For the best foliage plants Mr. Rann with a grand specimen of *Croton Warrent* was 1st; and Mr. Lock with *C. Dissect* was 2d.

Mr. Ams had the best pyramidal Coleus.

Mr. Reynolds was 1st for six pots of *Mignonette*, with specimens 2 feet 6 inches in diameter. Mr. Molyneux had the best table plants.

CUT FLOWERS.

For the most tastefully arranged basket (ladies) Miss B. Flight was 1st; Miss M. Hobby 2d; Miss E. Goldring 3d. Mr. Cypher was well to the fore with bouquets; he was awarded 1st prize for both ball and bridal bouquets. Mr. H. Rogers, nurseryman was 2d for bridal bouquets.

For twelve bunches of cut flowers Mr. Budd was 1st, followed by Mr. J. Evans, gr. to Lady Ashburn, Melchet Court, Romsy; 3d, Mr. H. James; all choice collections. For twelve varieties of herbaceous cut flowers, Mr. E. Molyneux was an easy 1st with a charming box of the new. Mr. W. Gilbert, Bishop's Waltham was 2d for twelve Carnations with a choice assortment. Messrs. Keyes, Williams & Co. staged the best Dahlias and Roses; the former were particularly good, being so early in the season.

FRUIT.

There were only two collections of eight dishes, Pines excluded. Mr. Ward, gr. to Earl of Radnor, Longford Castle, Salisbury, was adjudged 1st prize. His best dishes were Black Hamburg Grapes, good in colour though small in berry, good Muscats, though a trifle green. Malon, and good Moor Park Apricots. 2d, Mr. J. Evans; Muscat Alexandria Grapes. Best of all Melon, and Barrington Peaches were his best dishes. For the best three bunches black Grapes there were eight competitors, Mr. W. Pratt, gr. to Marquis of Bath, Longleaf, Salisbury, gaining 1st with large clusters of Black Hamburg, fine in berry and colour, but slightly rubbed. 2d prize, Mr. E. Molyneux, for same variety, not so large in bunch and berry, but more highly finished. 3d, Mr. C. Warden, gr. to Sir F. B. Ashurst, Clarendon Park, Salisbury, with smaller bunches scarcely coloured.

For three bunches of white Grapes Mr. Pratt was again 1st with five bunches of Muscat of Alexandria, perfect in every way except colour; 2d Mr. Budd. For two bunches of black Grapes Mr. W. Browning, gr. to J. Wylie, Esq., West Cliffe Hall, Hythe, was placed 1st, with large bunches of Black Hamburg, excellent in quality.

For two bunches of white Grapes Mr. Allan was 1st. The best single bunch of black Grapes was shown by Mr. Browning. The best single bunch was one of Muscat of Alexandria, from Mr. Budd.

Messrs. Drover had the best scarlet Melon, called Scarlet Perfection; the best green-fleshed was Hero of Lockinge, from Mr. Sanders.

Mr. J. Windebank was the 1st for Peaches, and also for kitchen Apples. Mr. Budd had the best Nectarines, and the best six dishes of hardy fruit.

VEGETABLES.

For twelve varieties a very close contest lay between Mr. Cox, gr. to R. K. Wyndham, Esq., Corhampton House, Bishop's Waltham, and Mr. G. H. Richards, gr. to Earl of Normanton, Somerley, Ringwood; 1st prize was awarded to the former exhibitor, who had magnificent White Elephant Onions, good Cauliflowers, and Carrots, Tomatoes, Celery, and Pragnell's Beet; his Artichokes and Cucumbers were weak. The 2d prize lot contained fine Artichokes, very fine Sutton's Gem Carrot, good Cauliflowers, fine Tomatoes, and good Canadian Wonder Beans, while the weak dishes were Onions and Turnips. 3d, Mr. Sanders, who had fine Tomatoes; 4th, Mr. J. Ams.

For nine varieties some good lots were staged. The first prize was awarded to Mr. E. Molyneux for fine Elephant Onions, Midsummer Kidney Potatoes, Nantes Heart Carrots, and fine Celery. Mr. J. Allen was 2d with fine Tomatoes as his best dish; 3d, Mr. Oxford; 4th, Mr. A. Richards.

There was a brisk competition for four dishes of round and four dishes of kidney Potatoes. Mr. Sanders had 1st prize with a clean even lot; 2d, Mr. West; 3d, Mr. Oxford. Mr. Allen had 1st prize for twelve spring-sown Onions, while Mr. Cox had the same for same number of autumn-sown Onions. Mr. J. Brown had a nice brace of Cucumbers as 1st prize; 2d, Messrs. Drover.

NORTHAMPTON HORTICULTURAL:

August 2 and 3.

HOWEVER meritorious the productions that go to make an exhibition may be, there are other matters that require to be taken into account before success can be attained, not the least of which is a suitable site whereon to hold the show. In this the Northampton committee are fortunate, as it would be difficult to point to a place so well adapted for the purpose as the beautiful park at Delapre, where,

amongst the fine old trees, the tents containing the various productions are dotted about. Independent of the interest attached to the contents of these the park in itself is a great attraction to the vast numbers of people who, on the two days of the annual gathering, enjoy the treat here provided for them. It is now four years since the first show was held, and on no previous occasion have the number of fine plants exhibited been near equal to the present year.

In the open class for sixteen stove and greenhouse plants, eight in flower and eight fine-foliage, there were four competitors. These groups, along with an equal number of collections in the class for ten, five in flower and five fine-leaved, occupied the centre of a very large circular tent, and made altogether one of the most effective displays we have seen for some time. The whole were arranged on the grass, with nothing beyond such improvised appliances as the exhibitors found necessary to raise the specimens which formed the back of their groups.

STOVE AND GREENHOUSE PLANTS.

In the open class, in which prizes of £18, £10, and £5 were offered, Mr. Cypher, Cheltenham, was well in front, showing a fine collection of remarkable plants; 2d, Mr. Finch, gr. to J. Marriott, Esq., Coventry, with a beautiful lot of flowering specimens; Mr. Roberts, gr. to A. Nicholson, Esq., Highfield Hall, Leek, who was a close 3d, had a fine lot of foliage specimens, but some of his blooming plants were weak.

For ten stove and greenhouse plants in flower, and five fine-leaved, Mr. Bird, gr. to A. Seymour, Esq., Norton Hall, Daventry, was 1st, having a pretty group; 2d, Mr. Miller, gr. to K. Loder, Esq., Whitebury, who also staged a nice collection.

GROUPS ARRANGED FOR EFFECT.

In the open class Mr. Cypher was 1st with a nicely arranged exhibit containing the right amount of colour; Mr. Parker, Victoria Nursery, Rugby, 2d; Mr. Roberts 3d.

In the class for groups in the second division of the schedule Mr. Bird was a good 1st with a nice arrangement; 2d, Mr. Miller; 3d, Mr. Holland, gr. to W. Jeffery, Esq., Billing Road.

MISCELLANEOUS.

Ferns were very well shown by Mr. Bird, who took the lead with a well grown half-dozen, the best of which were Davallia Mooreana, some 8 feet in diameter; *Cyrtogramma chrysochrylla*, 6 feet; and *Asplenium nidus-aurum*; 2d, Mr. Holland, whose best examples were *Adiantum Farleyense* and *Gleichenia Mendelii*.

Caladiums.—With six Mr. Holland had 1st, Mr. Farr, gr. to Sir R. Knightley, Fawsley Park, 2d.

Coleus.—These were well grown and finely coloured. Mr. Underwood, gr. to J. A. S. Bouvier, Esq., Delapre, 1st; 2d, Mr. Kightly, gr. to Sir Hereward Wake.

Tuberous Begonias.—Of these Mr. Davey, gr. to F. Simson, Esq., was the only exhibitor, having 1st with medium sized examples.

Fuchsias.—1st, Mr. Kightly, who staged medium sized examples, not too stiffly trained; 2d, Mr. Beard.

Zonal Pelargoniums.—Single varieties: 1st, Mr. Kightly, with large nicely flowered specimens, not over-trained; 2d, Mr. Underwood, who also had nice plants. Double varieties: 1st, Mr. Underwood; 2d, Mr. Beard.

Gloxinias.—Nicely grown plants, of large, prettily marked, erect flowered varieties were shown by Mr. Bird, who took 1st; Mr. Holland being 2d.

TABLE PLANTS

were well shown by Mr. Holland, who had 1st honours for twelve; 2d, Mr. Underwood.

CUT FLOWERS.

Stove and greenhouse, as well as hardy kinds, were well represented, collectively making an effective display. With twenty-four bunches of stove and greenhouse variety, Mr. Finch was 1st, having a good lot; 2d, Mr. Parker. Twelve bunches: 1st, Mr. Miller; 2d, Mr. Kightly. Twelve bunches hardy herbaceous varieties: 1st, Mr. Miller, with a good dozen.

Roses were very well shown, and were fairly numerous for the advanced season. With twenty-four single blooms, Messrs. Perkins had 1st, staging even tree flowers. Messrs. R. Mack & Sons, Catterick Bridge, who were a close 2d, also had a good stand.

Twelve Roses.—1st, Messrs. Perkins; 2d, Mr. Bennett, gr. to the Rev. W. H. Jackson, Stagden Vicarage. Here again the competition was as close as it well could be, both exhibitors staging fine flowers. With twelve Tea varieties Mr. Bennett was a long way ahead, again having beautiful blooms. 2d, Messrs. March.

Eighteen Roses (amateurs).—1st, Mr. Bennett, who here again had a good set of flowers; 2d, Mr. Ingram, gr. to W. Butlin, Esq.

Twelve (amateurs).—1st, Mr. Bennett; 2d, Mr. Ingram.

FRUIT.

Three bunches of black Grapes.—1st, Mr. Beech, gr. to the Marquis of Northampton, Castle Ashby, with medium-sized, finely finished bunches of Black Hamburg; 2d, Mr. Miller, who had smaller examples, but nicely finished.

White Grapes, three bunches.—1st, Mr. Farr, with Trebbiano, small, but well coloured; 2d, Mr. Bird.

Dish of Peaches.—With these, Mr. Bird took 1st, staging a nice dish of highly coloured fruit, unnamed; 2d, Mr. Finch, with Royal George.

Dish of Nectarines.—1st, Mr. Bird; 2d, Mr. Farr. Melon.—1st, Mr. Finch.

THE OXFORD CARNATION AND PICOTEE UNION: August 3.

MR. E. S. DODWELL provided an excellent show for the lovers of the Carnation and Picotee in his garden in the Stanley Road, Oxford, on the above date. Not only was the competitive exhibition in it a thoroughly good one, and the blooms characterised by a high average of quality, but there was, in addition, Mr. Dodwell's extensive collection in full bloom, all his canvases-covered stages being aglow with Carnations and Picotees, and in the open ground large beds of seedlings—plants of the most vigorous growth, carrying wonderful heads of bloom. If any person entertains the notion that the florist "coddles" the Carnation and Picotee, or for that matter, the plants into being under glass, as some undoubtedly do, for lack of accurate information, let them pay a visit to Mr. Dodwell, and there they will see abundant evidence of the adaptability of the finer forms of the Carnation and Picotee to make effective and invaluable border plants. Exhibitors of the Carnation and Picotee could not follow a more suicidal course than to attempt to force their plants into bloom under glass; when in bloom they give them the protection of glass and canvas only to see them from the effects of the weather, but with an abundance of air flowing in on every side. By raising the pots on stages under canvas the flowers are brought up nearly level with the line of sight, and their beauties can be examined under the most favourable circumstances.

CARNATIONS.

The competition blooms were arranged under a canvas tent, open at the sides, set up in a vacant space in Mr. Dodwell's garden. The leading class was for twelve blooms: dissimilar, seven prizes being offered, and six stands competed: the three first placed being remarkably good. The highest honours went to Mr. Lakin, Temple Cowley, in Oxford, a very successful and enthusiastic amateur. His flowers consisted of Scarlet bizarrés, Arthur Medhurst and Robert Lord, the last named a flower of remarkable finish; Crimson bizarrés, Master Fred and Kileman; Purple flakes. Sarah Payne, Squire Meynell, George Melville, and Squire Whitmore; Scarlet flakes, Tom Chapman and John Ball; Rose flakes, Mr. Symonds and Rob Roy. 2d, Mr. W. L. Walker, Bulmershe Road, Reading, who had S.B., Charles Phillips, George and Arthur Medhurst; C.B. and John Loney; P.P.B., Sarah Payne and Harrison Weir; P.F., Henry Startup; S.F., Henry Cannell, John Whitman, and Sportsman; and R.F., Tim Boinn and Biddy Malone. 3d, Mr. M. Rowan, Manor Street, Clapham, London, with a very good lot indeed, though two or three flowers showed signs of being past their best; 4th, Mr. W. A. Shaks Chesterfield; 5th, Mr. George Chaundry, Marston Lane, Oxford; 6th, Mr. William Wardell, Park Street West, Luton. In the class for six Carnations, dissimilar, there was a very vigorous competition, twelve collections being staged. Mr. Thomas Bower, of Bradford, Yorkshire, being 1st, with a very fine lot, consisting of C.B., Dr. Symonds, J. D. Hextall, and Kileman; T.B., Florence Knightingale; S.F. John Ball; and P.F., Mrs. Symonds. 2d, Mr. J. S. Hedderley, Swinton, Nottingham, with an excellent stand, consisting of S.B., Mars and Admiral Curzon; C.B., Harrison Weir; R.F., Maylor of Nottingham; S.F., Sportsman; and P.F., Sybil. 3d, Mr. Robert Lord, Todmorden, with S.B., Mars; C.B., George Fawcett; S.F., Clipper; P.F., Dr. Foster; R.F., Sybil and Cristo-galli. 4th, Mr. G. Wynne, gr. to Hulton Morris, Esq., The Nest, Hayes, Kent; 5th, Mr. C. Phillips, Earley, Reading; 6th, Mr. St. Ann's, Mill; 7th, Mr. T. E. Henwood, Earley, Reading; 8th, Mr. S. Brown, Crompton Road, Handsworth, Birmingham.

In the eight classes for single specimen Carnations, five prizes being offered in each, a large number of flowers were staged, and the task of judging proved to be one of some difficulty. S.B., 1st, Mr. C. Phillips, with Robert Lord; 2d, Mr. J. Lakin with Fred; 3d, Mr. M. Rowan, with the same; 4th, Mr. T. E. Henwood, with George; 5th, Mr. C. Phillips, with Charles Phillips. C.B., 1st, Mr. J. Lakin, with Kileman; 2d, Mr. S. Brown, with John Lakin; 3d, Mr. Rowan, with Master

Fred; 4th, Mr. J. Lakin with Samuel Barlow; 5th, Mr. Brown, with Black Diamond seedling, P.P.B., 1st and 2d, Mr. C. Phillips, with Faust; 3d, Mr. H. Startup, 3, Stanley Road, Bromley, Kent, with Master Fred, and 4th, with Samuel Barlow; 5th, Mr. W. L. Walker, with Master Fred, P.P.B., 1st, Mr. Walker, with Henry Startup; 2d, Mr. T. E. Henwood, with Sarah Payne; 3d, Mr. Robert Lord, with James Douglas, and 4th with Dr. Foster; 5th, Mr. Hedderley, with Mayor of Nottingham. S.F., Mr. Hedderley took 1st, 2d, 3d and 4th prizes with fine blooms of Sportsman, a sport from Admiral Carzon, S.B., which originated with Mr. Hedderley thirty years ago, and he states that he has never known it occur in the original form; Mr. J. Lakin being 5th with Tom Lord. R.F., 1st, Mr. J. Lakin, with Mrs. Symonds; 2d, Mr. Hedderley, with Sybil; 3d, Mr. Kowan, with Dolly Varden; 4th, Mr. A. R. Brown, Handsworth, Birmingham, with Miss Burton (new); 5th, Mr. J. Lakin, with Rob Roy.

The premier Carnation selected from the whole show was S. B., Robert Lord, shown by Mr. J. Lakin in his 1st prize stand of twelve blooms.

FANCY AND SELF CARNATIONS.

These were largely shown, and they were greatly admired for their exquisite coloring. In the class for twelve blooms there were eleven competitors, and the competition was exceedingly keen. Mr. W. Read, gr. to A. H. Dodwell, Esq., Stanley Road, Oxford, being 1st with a very fine lot, consisting of—Fancies: Huson Morris, Mrs. Mostyn Owen, Eurydice, Jessica, and William Bacon; Selfs: Mrs. Morris (white), Florence (buff), and some fine seedlings. Equal 1st, Mr. J. Lakin, with Fancies, Princess Teck, Mr. W. Mansgrove, Janira, and Sir B. Seymour; Selfs: Florence, Emma Lakin (white), Polly Clarke, Black Knight, Pride of Penhurst, and seedling; 3d, Mr. Huson Morris, with a fine lot, including Marchal Niel, a high-class yellow Self, and Queen of Yellow; 4th, Mr. Rowall; 5th, Mr. T. Austiss; 6th, Mr. Geo. Chaundry; 7th, Mr. H. Howell, gr. to G. H. Morrell, Esq., Headington Hill, Oxford.

In the class for six blooms there were nine collections, and 1st, Mr. Phillips was with an admirable lot, consisting of Mrs. Dodwell, Huson Morris, and Muriel (Fancies), Mark Antony, Cleopatra, and Florence (Selfs); 2d, Mr. R. Lord, with Sir Toby Belch (a good bloom), George Fawcett, Stanley Hudson, Huntsman, and two seedlings; 3d, Mr. Walker; 4th, W. Gawu, Esq., Illey Road, Oxford; 5th, Mr. Hedderley; 6th, exhibitor unnamed; 7th, Mr. T. E. Henwood; 8th, Mr. Slack.

Five prizes were offered in each case for the best single bloom of Fancies and Selfs. With Fancies, Mr. R. Lord was 1st, with George Fawcett; 2d, Mr. J. Lakin with Huson Morris; 3d, Mr. T. Austiss with Mrs. Pratt; 4th, Mr. J. Lakin, with seedling; 5th, Mr. Henwood, with Cleopatra.

Mr. Lord also had the best self in Huntsman; 2d, Mr. Walker, with Cleopatra; 3d, Mr. Austiss, and 4th, Mr. Lakin, with seedlings; 5th, Mr. Henwood, with Cleopatra.

The premier fancy or self was Sir Toby Belch, shown by Mr. R. Lord.

PICOTEES.
